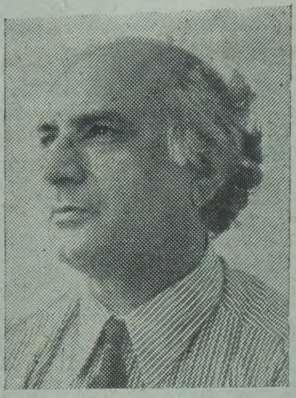
A member of the National Westminster Bank Group
whose capital and reserves exceed £1,800,000,000.

PEOPLE

Mr Duleep Singh has been elected chairman of the Fertiliser Association of India (western region).

Mr M. N. Buch has been deputed as executive director (marketing) to the Gujarat State Fertilizers Co Ltd.

Mr Hiro Shroff has joined the Bank of America as its communications officer for India. He was previously a foreign correspondent of the Press Trust of India.



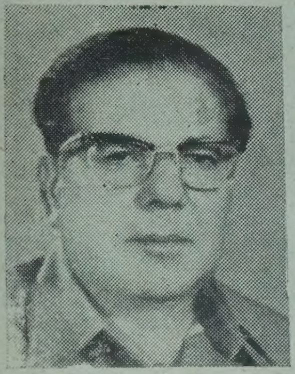
Hiro Shroff

Mohinder Puri

Mr Mohinder Pal Puri, recently elected president of the Punjab, Haryana and Delhi Chamber of Commerce and Industry for the year 1981-82, is a qualified chartered accountant and also holds a degree in law. Mr Puri is a director of several companies and was first elected to the managing committee of PHD Chamber in 1968. Since then he has been continuously associated with the chamber and became its vice-president in 1980. Besides, he is also on the managing committee of Assocham.

Mr M. Chandramouli Reddy, IAS, has taken over as the vice-chairman and managing director of Andhra Pradesh Small Scale Industrial Development Corporation Ltd. Till recently Mr Reddy was the commissioner of the endowments department of the Government of Andhra Pradesh. He was also previously chief secretary to Pondicherry Government, and chairman and managing director of Andhra Pradesh Steels Ltd and Republic Forge Ltd.

M. C. Reddy



V. S. Kapoor

Mr Mahendra K. Sanghi of Sanghi International Travels has been re-elected president of the Travel Agents Association of India. Mr Karan B. Sarwal of Thomas Cook (India) Ltd was also re-elected vice-president.

Mr J. J. Mehta has been elected chairman of the Manmade Fibre Spinners Association.

Mr V. S. Kapoor has been promoted general manager (planning and development) at the State Bank of Bikaner and Jaipur.

Mr Vidya Rattan Kapoor, a technocrat, has been elected president of the Bombay Industries Association. A graduate in chemical engineer, Mr Kapoor was associated with various companies from 1952 to 1962. In 1962 he set up his own industrial unit, called Union Paint and Chemical Co at Bombay which has grown into a leading supplier of paints, primers, coatings and finishings, lubricants, fire cements and refractory concrete.

V. R. Kapoor

THE WEEK

The Public Investment Board has cleared the proposal for the Rs 300-crore phosphatic fertiliser project to be set up at Paradip (Orissa). It will have a capacity of 3,00,000 tonnes per annum. ★

A broad agreement is understood to have been reached over complete take-over of Oil India Ltd by the Central Government. The take-over will be effective retrospectively from January 1, 1977. At present the Government is a partner with Burmah Oil Co in this company. ★

State Bank of India proposes to deploy additiona credit of Rs 59 crores this year for the priority sector specially small farmers and industrial units. Till March last Rs 236 crores were provided to farmers and industries out of total disbursements of Rs 278 crores t the priority sector. ★

Non-receipt of dues from Tamil Nadu State Electricity Board is reported to have threatene Neyveli Lignite Corporation at Cuddalore with immediate closure. Outstandings are said to have accumulated to about Rs 32 crores. ★

International Airports Authority of India ha bagged a Rs 35-crore contract for stage II development project at Brak airport in Libya. IAAI als completed the first stage work costing Rs 22 crores. ★

The non-availability of steel at international pric is reported to have cost the engineering goods exporters dearly in that they have lost new oversea orders to the tune of Rs 200 crores during the last fiv months. The Government had promised supply o steel at international price and also protection t engineering goods exports from steel price increas which came about on February 9. ★

The Association of Indian Engineering Industr will send a study team to Uganda in October to identify areas of industrial co-operation. ★

The fifth atomic power station of India to be se up at Kakrapur in Gujarat will have four reactors o 235 mw each. Initially, however, the Atomic Energ Department will commence construction on tw reactors costing about Rs 383 crores. ★

Wholesale price index

At 279.1, the latest available wholesale pric index for the week ended June 20, 1981 showed a ris of 0.5 per cent over the preceding week and 12.0 pe cent over the year.

Money comfortable

Conditions in the Bombay short-term mone market as of Monday (July 6, 1981) were comfortabl Both notified and commercial funds were renewed 9 per cent while fresh money was transacted at per cent.

COMMERCE

. . . But what about government consumption?

WITH the economy still bedevilled by potential hyper-inflation the Government had no other alternative but to take a few harsh steps which could possibly contain powerful inflationary forces. Inflation has shattered the fabric of the Indian economy. It has also shattered industrial relations and destroyed the peace of our kitchens. So any step that the Government takes to curb inflation must be welcomed. The measures that the Government announced on July 11 were: It increased the Bank rate by 1 per cent. It also increased the quantum of compulsory deposits to be paid by income-tax payers with incomes of above Rs 50,000. It also took measures to curb *benami* deposits. The Income-tax (Amendment) Ordinance issued on July 11 now requires banks, companies, cooperative societies and partnership firms to repay deposits made with them by account payee cheques where such deposits amount to Rs 10,000 or more. Before the measures were announced the Government had increased petroleum and urea prices. The upward revision of petroleum prices came within less than six months, the last revision being in January 1981. This will yield yearly Rs 1,200 crores to the exchequer. Another Rs 900 crores will be added to Government revenue as a result of the measures announced on July 11. So it is estimated that the Government revenue would increase by about Rs 2,000 crores. Some amount may be by way of straight income while some amount may go to the government coffers by way of purchase of securities.

There is no doubt that because of the rise in petroleum prices it would increase the prices of all goods and services which use industrial and other oils. The idea behind the hike in petroleum prices seems to curb the growth in consumption of petroleum products which even in 1980-81 was 31 million tonnes. The oil price increase may also encourage the use of alternative sources of energy like coal. The second reason behind the hike in petroleum prices is, of course, revenue. When the Government has decided to expand oil exploration and drilling in a big way, the resources must be found for this. From this point of view also the increase in oil prices could be justified.

This then is a welcome start. The Government has made a good beginning in trying to curb inflation. While moderating demand, the Government has not ignored the supply blade of the scissors. The decision to import wheat, sugar and edible oils at the reported foreign exchange cost of Rs 1,000 crores may look absurd at a time when foodgrains output is likely to be bumper. But the record of procurement continues to be dismal. As against the procurement target of 9.5 million tonnes the actual procurement so far is only 6.5 million tonnes. And it is unlikely to exceed seven million tonnes during the entire 1981-82 marketing season. In these conditions it is necessary that imports of foodgrains are made at a time when world foodgrain prices are relatively attractive for importers. But the Government's programme to export rice seems to be short-sighted.

But the Government has not answered the major question of rising government expenditure. The Government should also assure the people that it will not only curtail its expenditure but it will also curtail the consumption of such goods as cement, paper, cloth, petroleum products and steel. If the belt is to be tightened the beginning should be made by the Government especially when the government expenditure today has gone up to a staggering height of Rs 35,000 crores a year, in other words, nearly 27 per cent of our national income. In announcing these measures, the Finance Minister, should have first assured the people that he would also cut government expenditure so that at least the Central Budget would now be balanced. It is deficit budgets which influence bank credit to the government sector. It is true that bank credit to the commercial sector increased by Rs 6,100 crores during the year ending June 26, 1981. But net bank credit to government sector increased during this period by as much as Rs 6,500 crores. While most of the credit to commercial sector is for productive purposes the same cannot be said about the bank credit to government sector. The Government has to rely on bank credit because of record breaking budgetary deficits in recent years. In 1978-79 budget deficit was Rs 1,500 crores and in the subsequent year (1979-80) it rose to Rs 2,400 crores and in 1980-81 it was about Rs 2,000 crores. In the current financial year the Finance Minister has again left the budgetary gap of as much as Rs 1,500 crores. But because of the lower sale of bearer bonds the budgetary deficit would again go up to Rs 2,000 crores.

So unless the Government discards the inflationary strategy of financing development and public expenditure, we will continue to have uncontrollable inflation with us. People have suffered not because there was not enough growth, not because the supply side was very weak, but because the Government increased money supply far out of proportion to the increase in real national income. Unless this problem of fiscal irresponsibility is tackled, even the boldest anti-inflationary measures will continue to remain ineffective.

ANTI-INFLATIONARY PACKAGE

New phase in dear money policy

By OUR SPECIAL CORRESPONDENT

BOMBAY

IN a bid to control inflation, which is still running at the rate of 12 per cent, the Government of India announced monetary and financial measures which include a hike in the Bank rate by one per cent and compulsory deposits under the Income Tax Act at higher rates for income groups above Rs 50,000. New Delhi also issued an ordinance to amend the Income Tax Act which makes it compulsory for banks, companies, co-operative societies and partnership firms to repay deposits made with them by any person by account payee cheques or bank draft where the amount of deposits together with interest is Rs 10,000 or more. The savings and current deposits will not come under the purview of the ordinance but the measure is expected to unearth *benami* deposit accounts. It is hoped thereby that black money transactions which are one of the causes of inflation will be checked.

The announcement of the rise in Bank rate from nine to ten per cent came from the Reserve Bank of India (RBI). It became effective from the close of banking business on July 11. The Bank rate hike is not as stiff as in 1974 when it was raised from seven to nine per cent in the anti-inflationary package then announced. Some industry spokesmen have reacted strongly by saying that trade and industry would be affected adversely as the credit would be costlier and restricted. But others point out that the Bank lending rates are already high and this was an exercise by the RBI to bring the Bank rate in line with the lending rates.

Credit is expected to be restricted for industry because simultaneously the RBI has raised the Statutory Liquidity Ratio (SLR) of banks from 34 to 35 per cent in two phases—from 34 to 34.5 per cent from September 25 and 35 per cent from October 30. Also the RBI has advanced the effective date of the rise of the second phase of the increase in the cash reserve ratio from September 11 to August 21. In May 1981, the RBI had already announced that the cash reserve ratio of scheduled commercial banks would be raised from six to seven per cent of net demand and time liabilities in two stages of six to 6.5 per cent by July 31 and to seven per cent by September 11. These two steps are expected to impound Rs 800 crores from the liquidity of the banks.

Simultaneously the Reserve Bar has also taken measures to tighten th control on selective credit. The RB has directed banks that the minimu margin against stocks of wheat, padd rice and other foodgrains should b raised with immediate effect by 10 pe centage point across the board with th exception of advances to roller flo mills.

A Reserve Bank press release sa that these anti-inflationary moneta measures had been taken "with a vie to contain inflationary pressures". Th overall monetary and credit trends we reviewed in May 1981 and certain p licy measures were announced by th RBI to control the growth in liquidi in the economy. "More recent trend indicate no abatement of the pace monetary expansion", the RBI said. Th pace of monetary expansion (M-3)

Changes in Bank rate (a) in India : 1938-39 to 1981-82

Year	Bank rate (per cent per annum
1938-39	3.0

Benami deposits

By OUR FINANCIAL CORRESPONDENT

BOMBAY

WHILE the Government's decision that repayment of deposits of Rs 10,000 and above by companies, banks, co-operative societies and partnership firms should be made by account payee cheques or drafts only is well intended, doubts are raised about its practicability. This is one more step to bring *benami* deposits with banks or companies into the tax net and curb the growth of black money after the Special Bearer Bonds Scheme which netted about Rs 390 crores. So far so good. However, the measure does not seem to be foolproof. There are a few loopholes. Unless they are plugged, this decision would not yield fruitful results.

Now that the limit for repayment of deposits through cheque has been fixed at Rs 10,000, the deposits may be in more than one *benami* account in small segments of say Rs 7,000 or Rs 8,000 so that along with interest the amount to be repaid does not exceed Rs 10,000. Secondly, those who receive account payee cheque by way of repayment would open a new account, encash the cheque and close the account. Perhaps, the number of new bank accounts might increase and to that extent it would involve unproductive labour for bank employees. Today there are about more than two crore deposit accounts in the country and it is going to be a Herculean task to scrutinise a number of small bank accounts closely.

There is one more danger. Perhaps hereafter profiteers and blackmarketeers would prefer to invest in hoarding commodities to yield quick money. In the days of rising prices this will be a paying proposition. The purpose of unearthing black money may or may not be served, but this would certainly act as a fuel for inflation.

1980-81 was 18 per cent against 17.3 per cent in 1979-80. The growth of M-3 in the early months of 1981-82 up to June 1981 indicates a rate of expansion of 4.4 per cent against four per cent in the corresponding period of the previous year. The growth of non-food credit in the first quarter in the current financial year (up to June 26, 1981) also gives "cause for anxiety" with an increase of Rs 587 crores (2.5 per cent) against Rs 221 crores (1.1 per cent) in the corresponding quarter of the previous year.

Date from which effective	Rate (Per cent per annum)
Up to November 14, 1951	3.0
November 15, 1951	3.5
May 16, 1957	4.0
January 3, 1963	4.5
September 26, 1964	5.0
February 17, 1965	6.0
March 3, 1968	5.0
January 9, 1971	6.0
May 31, 1973	7.0
July 23, 1974	9.0
July 12, 1981	10.0

Commerce Research Bureau .. ..

A new phase of dear money policy would thus seem to have begun. The increase in the Bank rate will have an impact on the structure of bank lending rates as they are linked to Bank rate. Automatically the lending rates will go up by 1 per cent though in the past deposit and lending rates of banks have been increased without a change in the Bank rate. The absence of an indication from the Reserve Bank as to whether the lending rates will go up further is no pointer that the Reserve Bank and the Central Government might not change their minds. They could as well put a ceiling on the existing levels though lending agreements link the lending rates to the Bank rate.

It is interesting that, in May 1981 when the cash reserve ratio of the banks was changed, it was explained that the money would remain with the Reserve Bank and not be invested in government securities. This time the statutory liquidity ratio has also been raised and this will mean more resources from the banking system to the Government. Bankers have commented that the Government will have to be careful about its expenditure and investment policy for they have an important bearing on inflationary forces. As for the banks themselves their profitability is expected to go down with the impounding of Rs 800 crores of funds and the rise in the Bank rate to 10 per cent unless, of course, the Reserve Bank permits the banks to raise their lending rates further.

The Income Tax (Amendment) Ordinance, 1981, as explained earlier, provides that banks, companies, co-operative societies and partnership firms **will be required to repay deposits made** with them by any person by account

Continued on page 108

Price of bank money goes up

By S. G. SHAH

Our Banking Correspondent

A ten per cent Bank rate, a further increase in SLR (statutory liquidity ratio) and an earlier increase then announced in CRR (cash reserve ratio) will have a double effect on bank money: its price will go up and availability will go down. Banks will also find a double effect on their profitability—earnings from advances will go up because of the higher rates on lower credit outstanding, but these will be counterbalanced by lower earnings on higher liquidity and cash reserves.

The borrowers will find that lesser money is available at higher costs and there will be much more haggling on the purpose and the amount of bank credit.

The net position has still not crystallised because bankers are meeting the Reserve Bank Governor on July 17, to sort out the implication of the new Bank rate on the interest rates structure of deposits, commercial advances and priority sector advances. The meeting will also have to define how bank credit will have to be rationed in practice—by freezing the accounts or by applying an all across-the-board 10 to 20 per cent cut in peak utilisation, or by a selective purpose rise utilisation—checking uses of inventory build up or speculation and allowing normal uses for productive purposes. As happens on all such occasions in the past, there is no empirical evidence nor are there criteria to determine the distinction between speculative and productive purposes. It is also a matter of opinion where credit adds to production and where it adds merely to speculation. Thus even after Friday (July 17) guidelines given to bankers by RBI, the borrowers and bankers, they will continue to be a subject of continuous debate.

Meanwhile, three points are clear. There has been an 18 per cent rise in money supply, deficit financing has been large and neither RBI nor the Government had an alternative to raising the interest rates. Second, at present, since all lending rates are linked to Bank rate, all of them will go up by 1 per cent except those where the ceiling rates apply. But it is reasonable to expect that by the end of this week, the RBI will raise the ceiling rates also. Third, business and industry are again served a notice that they cannot rely on bank funds to finance their inventories and current assets because banks have less funds and other more pressing priorities, just as they cannot now rely on institutional agencies for term finance because they have no funds. The ultimate rationale of all this debate and measures is two-fold. First, it should encourage or induce borrowers to economise in the use of funds. In fact it does not. In inflationary times like this, borrowers find it more profitable to use bank credit for speculative purposes rather than for productive purposes. Therefore rather than promoting economy in the use of bank credit, such extreme tightness promotes a diversion towards undesirable uses of bank credit.

Second, it should encourage banks to look for more economical and efficient ways of management to compensate for thinning margins on funds. This is not so impossible or visionary a task as it might appear to be or as it made out by the banks. Even within the banking spectrum there are some institutions that make better profits through efficiency of funds management or general management and through better systems and more economical procedures. They set up targets for the other banks to follow. But in practice even this does not happen. Banks have found a convenient excuse in saying that they are making losses due to "priority sector lending" although in practice evidence is plenty to show their inefficiency in management.

It is necessary to force bank managements to consider the problem of efficiency more seriously. In part, every time funds margin are squeezed, the burdens are passed on to the borrowers or depositors or both and banks get a reprieve and forget or neglect about efficiency. Once in a while it is necessary to ask banks to absorb the new burdens through better financial management and general efficiency.

LETTER FROM LONDON

FRANK BROADWAY

Gentle recovery

AS evidence continues to accumulate that the British economy is either at or past the turning point between decline and gentle recovery, debate is switching to the longerterm options which might improve performance during the rest of the decade. Mrs Thatcher's Government has characteristically rejected calls for greater protectionism and for reflation through increased public spending, and quietly implements its medium-term financial strategy and develops the measures announced in the March budget.

These measures included further reductions in public expenditure, and continued control of the growth of the monetary aggregates within a target range slightly below that set for the fiscal year 1980-81.

The Treasury has asked Departments to prepare two sets of options for cuts in cash spending : three per cent and five per cent in 1982-83, and five per cent and 7½ per cent in 1983-84. Ministers have been asked to review all the activities of their Departments, and to consider relinquishing some less essential functions.

The Cabinet will decide the cuts to be made in the autumn. It is accepted that some of these decisions will be contentious, but it has always been a tenet of the Government's philosophy that public expenditure must be curbed to allow resources to flow into the wealth-creating private sector.

Statistics of monetary growth have been distorted by sporadic industrial action by some civil servants, which has delayed collection of substantial tax amounts. The estimated growth of £M3, after correction for distortions, was about 0.75 per cent in April, an annualised growth of 9-10 per cent, which is within the Chancellor's target of 6-10 per cent, expansion in the 14 months to April next year.

This stability in monetary growth might have prompted hopes of a further cut in British interest rates, after the two per cent reduction to 12 per cent in the Bank of England's minimum lending rate announced in the budget. The recent escalation of American prime rates, and the generally unsettled conditions in world money markets appear to have ruled out any such reduction for the time being.

With an eight point interest differential between London and New York, sterling naturally has fallen against the dollar. During May it touched its lowest levels since the autumn of 1979, although it held up well against other major trading currencies.

There is some evidence that the pressures which kept sterling so strong during the last twelve months are now easing. The April banking figures indicated a modest outflow of sterling from the private sector. British businessmen welcome this easing of pressures and it is still government policy to allow the exchange rate to move in line with market forces.

The official view was reiterated last month in a policy document on trade. Replying to a report earlier this year from a House of Commons Committee on industry and trade, the Government reiterated its exchange and interest rate policies. It also rejected demands for specific protective measures against imports and reaffirmed support for open market trading. This support does not preclude action against dumping when it is justified, including the use of international remedies through the General Agreement on Tariffs and Trade of the European Commission.

Controlling inflation as the basis for soundly based economic growth remains the priority. In April, the annual rate of increase in retail prices fell by 0.6 per cent to 12 per cent, despite the impact of the increases in indirect taxes announced in the budget. The prospect is that the annual rate of increase will continue to decline but at a slower rate, reaching about 10 per cent towards the end of the year. Recent moderate wage settlements should help to hold the rise in retail prices at an acceptable level.

Like the retail prices index, the other major economic indicators seem to be moving gently in the right direction. After rising by 0.8 per cent in February, industrial output fell by 0.4 per cent in March, but the detailed industry analysis suggests that restocking may be starting. Chemical industry output, which normally turns up early in the course of economic recovery, was 1.8 per cent higher in the first quarter of 1981 than its low point in the third quarter of last year.

The engineering industries can however take some comfort from the fact that the latest estimate of capital spending suggests a four per cent fall this year, instead of the six per cent drop indicated by a survey at the end of last year. The motor industry is also forecasting in five per cent increase in sales next year.

Retail sales rose 0.9 per cent in April, in contrast to gloomy initial claims by critics that the budget would prove contractionary. It is reasonable to expect that people will now save less as inflationary expectations diminish, leaving more money for spending, so there should be no major impediment on the demand side to gradual recovery.

Even the unemployment figures show some modest hope. The seasonally-adjusted adult unemployment total rose by some 60,000 in May to 2.51 million.

The general statistical picture is thus consistent with the start of economic recovery, but nobody is expecting any dramatic upturn this year. After the exceptionally severe recession, progress is likely to be slow and patchy, and unemployment is expected to continue to increase, though at a slower rate, for the rest of this year.

Now that manufacturing industry has closed down a good deal of marginal capacity and tackled its overmanning problems, some relatively small increases in sales volume can be expected to produce significantly higher levels of profitability. This will be good for the economy, but it means that employment will not increase appreciably until a large measure of recovery has been achieved.

Longer-term and essentially gradual measures will have to play their part in easing the unemployment problem in Britain. Two of them come into action this month. On June 1, the new scheme announced in the Budget for commercial banks to make loans of up to £75,000 to small businesses against a government guarantee, came into operation. On June 11, Britain's first enterprise zone, an area in which businesses receive tax concessions and substantial freedom from bureaucratic restriction, was opened in Swansea in South Wales.

EDITOR'S NOTEBOOK

Vadilal Dagli

GOLD prices have started again tumbling down. The first week of July was the worst week for gold hoarders. On July 8 gold pierced the barrier of $ 400 and closed at $ 398 an ounce—the lowest price in 18 months. There is a co-relation between the strength of the US dollar and the price of gold. As the US dollar is strengthening the gold price is going down. There is also a co-relation between high interest rates and gold. As interest rates have climbed above 20 per cent in the United States, gold has lost its value as an investment. As a West German financial expert put it: "The dollar has risen like a Phoenix from the ashes. If at the beginning of the year anyone had predicted that dollar in a few months would be just under 2.50 Marks in value he would have been laughed at". Since last September when gold price was $ 750 an ounce its price has been falling gradually. On September 31, it was $ 591.30; in January 1981, the price fell by more than $ 100 and it closed at $ 481 on February 2. For the next four months, gold prices remained steady between $ 468 and $ 550. But since the last week of June it has started falling. On June 22 it was $ 464 and in nine trading days of June it lost $ 66 and on July 8 it fell to $ 398. Though the gold price has slightly recovered, the speculators have lost faith in gold.

Although Americans had started unloading gold since last September, Europeans were holding out in the hope that interest rates in the United States would come down and inflation rate in that country would again rise to two digit figure. But this has not happened. Now Europeans are nervous. They are unloading gold. An American expert has commented that "Europeans are baling out. Many people view $ 400 as an important psychological level, They are talking $ 375-380. The Europeans have been pushing it down like crazy". Several factors besides high interest rate and the strong dollar have contributed to pushing down the prices of gold. Firstly, high-yielding government securities have also adversely influenced gold prices. Expectations of gold prices going up to $ 1,000 an ounce were also exaggerated. The Soviet Union which is buying grains and butter from the West is selling gold. South Africans who are the main suppliers of gold had to sell more gold during the recent months because lower gold prices created balance of payments difficulties for them. So gold today is no more a traditional attraction as an investment item in the West. Gold mining companies have been saying that if the prices of gold go below $ 400, it may not be economical for them to mine more gold.

Whatever may be the future of gold mining, one thing seems to be certain. Gold which rose to dizzy heights in the seventies has been climbing down in the beginning of the 80s. What about India? While gold prices are declining in the west, Indian gold prices are not going down to that extent with the result the price differential in gold between the London and Bombay markets has been increasing. For instance, on June 26 gold price for 10 gm in Bombay was Rs 1,635 as against Rs 1,237 in London—a difference of Rs 398. On July 7, gold price in Bombay was Rs 1,650 whereas in London it was Rs 1,157—a difference of Rs 493. Some observers, however, believe that gold may stage a recovery, but that may be marginal. At present it seems that the gold fever has abated.

★

"FACTS have proved that it amounts to sheer illusion to suppose that socialism can be built by deliberately preventing people getting rich. It is equally absurd to maintain a low level of income for people in relatively prosperous areas or units to prevent a possible polarization of society."

Who wrote this para? Reagan, Margaret Thatcher or a spokesman of Forum of Free Enterprise? None. It is from an article published by a leading Chinese communist journal with official blessing. China has now realised that individual initiative and free enterprise have an important role to play in economic development. They have now discarded the machinery of central planning, which was the replica of Soviet planning. Equality and egalitarianism is now described as an "anti-socialist error". The new rulers have recently rehabilitated more than seven lakh small businessmen who were described by Mao as capitalist exploiters.

But rethinking that has been initiated by the all powerful Mr Deng Xiaoping, Vice-chairman of the Chinese Communist Party, has accepted financial incentives, individual initiative and even inequality as necessary stimulants to economic growth. Mr Deng does not mean that a new class of rich will emerge. But what he means is that China will accept a mixed economy. The Chinese economy is in a crisis. The recent World Bank report has pointed out that China has remained quite backward in most of the major industries. Its administration is bureaucratic and its planners are inefficient in the use of energy. The Government has permitted free enterprise in agriculture, in industry and in trade. But the first condition is that it must meet the quotas that are being fixed by the planning authority. Having met the quotas these enterprises will be free to produce and market the rest of their produce as they wish. Under the Soviet system there is no incentive to fulfil the norms. The Chinese set the norms which are 20 to 40 per cent below production capacity.

So an entrepreneur or a farmer or a trader knows that he has enough margin to sell his goods. About 6,000 enterprises are participating in this experiment. These enterprises are told to keep foreign exchange earned by them for importing foreign technology or raw materials. They are also authorised to decide as to how much bonus they should pay to the workers. They have been given power to penalise workers and managers who cause heavy losses to the State.

A similar system is being introduced in agriculture. The production teams are broken down into smaller groups, even individual families and they work on a sort of a contract system. This leaves them with freedom to use their time as they wish, to decide on the best crops to plant and to work for themselves when their quotas have been met. In addition, private plots have been permitted to take 15 per cent of the land instead of 7 per cent in the past. All that is produced above the targets comes into a free market. Small private enterprises are permitted to employ up to two people besides the members of their families. This has been welcomed by consumers. The service industry was breaking down as there was dearth of tailors, shoemakers, washermen as also repair shops. The Chinese rulers have been forced to take these measures because the economy was showing signs of collapsing. Inflation has also been rising. Out of nearly 100 million urban workforce 25 million are out of jobs.

New phase in dear money policy

Concluded from page 105

payee cheques or account payee bank drafts, where the amount of such deposit repayable together with interest, if any, is Rs 10,000 or more. However, banks including co-operative banks will be permitted to repay any deposit made with them by a person who has an account with the bank by crediting the account of such person. Failure to comply with this requirement will involve imprisonment for a term up to two years and a fine of an amount equal to the amount of the deposit.

The second ordinance, the Compulsory Deposit Scheme (Income Tax payers) Amendment Ordinance, 1981, raises the rates of compulsory deposit in the case of persons in the higher groups as a measure for restraining conspicuous consumption. The new rate of compulsory deposit for persons with current incomes in the range of Rs 50,000 to Rs 70,000 will be 15 per cent as against 12½ per cent hitherto and the rate of compulsory deposit in respect of incomes exceeding Rs 70,000 will be 18 per cent as against 15 per cent hitherto. The new rates will apply in relation to the assessment year 1982-83 and 1983-84. The rates of compulsory deposit in respect of current income up to Rs 50,000 have not been changed.

The anti-inflationary package as announced does not put curbs on dividends, as was widely expected, and also does not seek to impound half of the dearness allowance of government employees, as was believed to be the inclination of the Government. Reportedly there was opposition from some of the Cabinet Ministers to the second proposal.

As far as dividend freeze is concerned, it would appear that the Government feared that the investment climate would be disturbed. The Finance Minister, Mr R. Venkataraman and recently Mr N. N. Pai, chairman of the Industrial Development Bank of India, have talked about the need for large houses in particular and the corporate sector in general not to rely on financial institutions for their capital requirements. They have been asked to depend more on making rights or debenture issues or raising the equity needed. The Government's decision has to be appreciated in this context.

COSTLIER PETROLEUM PRODUCTS

Accelerated oil exploration programme?

By D. B. MAHATME

THE Government of India seems to have taken the immediate risk of increase in transport, industrial and household costs in announcing a steep rise in the prices of petroleum products with an eye on long-term benefits that could accrue. Hefty increases in the prices of petrol, high speed diesel oil, kerosene, cooking gas and furnace oil have been announced with effect from July 11. The increase in the price of petrol will be 53 paise per litre and of kerosene 15 paise. The price of high speed diesel oil has been pushed up by 32 paise per litre and that of furnace oil by Rs 235 per kilo litre. Cooking gas will cost Rs 5 more per cylinder of 15 kg.

The hike in the price of petroleum products has come in for severe criticism from industry and business and a large body of newspapers have called it an ill-advised move. No one seems to be convinced by the justification advanced by the Government that the prices have been increased on account of the steeply rising cost of exploration and development programme, the need to moderate the growth for demand for petroleum products and to promote their economic and efficient use. The Finance Minister, Mr R. Venkataraman's statement that he expected the consumption of crude to go down by at least one million tonnes from imported 15 million tonnes has not also made any impact.

And yet the increase in the prices of the petroleum products should have come as no surprise. The Sixth Plan document had cautioned that, in parallel with action on technological front, an appropriate energy pricing policy would have to be followed in order to induce economies in the use of energies in all sectors and encourage the desired forms of inter-fuel substitution. In the past, it said, the pricing of energy had not reflected either the true costs to the economy or helped to ensure the financial viability of energy industries and this situation could not be allowed to continue for long. Further, it was wrong to think that an adjustment in the prices of basic input like energy would aggravate the inflationary situation. The costs to the economy were not reduced by not reflecting them in proper pricing and "indeed, the continuance of wrong pricing policies has a far more deleterious effect on the health of the eonomy than is often realised". Again "given the pressure of international oil prices and rising domestic energy cost the high priority will have to be given early in the Plan period to the evolution of a structure of energy prices which reflects true costs, encourages economy in energy use and promotes replacement of scarce fuels".

Can an increase in prices lead to a curb on the growth in consumption of petroleum products? The recent experience would suggest that the Finance Minister, Mr R. Venkataraman, had some basis in expecting that imports of crude oil could be reduced. During 1980-81 demand for petroleum products did not turn out to be as high as expected. As against the anticipated 33 million tonnes, the demand rose only to 31 million tonnes from 29 million tonnes in 1979-80, or it rose by only 6.2 per cent. One reason could be the hike in prices of petroleum products made in last January though it cannot be said with certainty that was all the explanation for the fall from the anticipated demand. The difficulty is that consumption of petroleum products is not that elastic. But it must be conceded that industry and other sectors will be forced to make more efficient use of petroleum products than has been the case so far. This point has been sought to be driven home by organisations like the Association of Indian Engineering Industry, All India Manufacturers' Organisation and Bombay Chamber of Commerce and Industry, at seminars held by them for the benefit of their industry members. The transport sector could also make better use of the oil products and not waste them if only the design of the engines is improved and their maintenance is looked after well.

Some reports have suggested that as a result of the various measures already taken by the Petroleum Ministry to raise

Old and new prices of some petroleum products (Bombay)

	Unit	Pre-July 10, 1981 price Rs.	Post-July 10, 1981 price Rs.
Petrol	liter	5.56	6.15
Kerosene	kilolitre	1,408.43	1,558.43
High speed diseel oil	litre	2.61	2.96
Furnace oil	kilolitre	2,317.91	2,564.66
Naphtha :			
Fertiliser	tonne	1,378.04	1,729.64
Petrochemicals	tonne	2,830.15	2,830.15

domestic production of oil and it would be possible to curtail the import bill for crude and petroleum products next year by about Rs 1,000 crores, cutting the imports from 16 million tonnes of oil and 6.5 million tonnes of products this year to 14 million tonnes of oil and about three million tonnes of oil products next year. These reports sound rather optimistic but that the Government is keen on the Oil and Natural Gas Commission and even Oil India (which is expected to wholly government owned in the near future) in stepping up their activities is very clear. The Sixth Plan document has itself conceded that while several measures have been initiated in the last few years to accelerate exploration for oil and gas there are still large areas — both offshore and on-shore — where the exploratory efforts need to be intensified and that as oil prices rise exploration of even relatively less promising areas becomes economic despite a higher discovery cost of oil. The Plan provides for Rs 2,874 crores for the exploration and productive activities of Oil and Natural Gas Commission and Oil India Ltd. But it is known that ONGC has submitted a plan for accelerated programme of its off-shore activities. ONGC sources have been tight-lipped on this programme since this has not yet been cleared by the Government. It could be that the hike in petroleum products prices is the first signal from the Government that this accelerated programme will be approved.

Newspaper reports have suggested that New Delhi had decided to raise by 300 per cent the prices of domestic crude oil to place at the disposal of the Oil and Natural Gas Commission and Oil India larger funds for exploration and production of oil. Indigenous crude oil, it is reported, will be paid a price of Rs 1,180 per tonne as against the price of Rs 324 per tonne for on-shore crude and Rs 458 per tonne for off-shore crude. This should enable the Government of India to do away with the large budgetary support that it had been giving to the Oil and Natural Gas Commission in particular. The ONGC in 1979-80 made no doubt a net profit after tax of Rs 55.23 crores but in the same year it had received Rs 106 crores as capital and loans from the Government and other agencies. The higher prices of petroleum products, it is expected, would fetch to the exchequer over Rs 1,050 crores in a full year and during the remaining period of the current financial year a sum of Rs 825 crores. To the extent the Government will not have to provide budgetary support to the ONGC and Oil India and its finances will improve, this can be regarded as an anti-inflationary measure though the immediate impact will be a rise in transport and industrial costs.

DOCUMENT

Text of Prime Minister's statement

The following is the text of the statement made by the Prime Minister, Mrs Indira Gandhi, at her press conference in New Delhi on July 10, 1981:—

What people are most concerned about is the economy. We have given the greatest importance to tasks of economic development and raise the standards of our people especially the poor.

The principal elements of our economic strategy are the growth of agricultural production, rapid industrialisation and modernisation, progress in technology and the even spread of the benefits of development, taking the maximum care to preserve the environment.

We have taken a number of steps to solve long-term problems. We have finalised and launched the Sixth Five-year Plan. We have adjusted our industrial policy, placing maximum emphasis on production.

We are trying to ensure that agricultural development spreads throughout our country. We are promoting technological development, accelerating programmes of energy production and developing alternative sources of energy.

Short-run problems are often very critical and absorb much of energy. The most pressing problem today is that of inflation. The annual rate of inflation came down from as high as 21.4 per cent in 1979-80 to 15.4 per cent in 1980-81.

This decline in the rate of inflation has continued until now, and in the current financial year, up to June 20 this year the annual rate of inflation has come down by over 10 per cent compared to last year.

In 1980-81, we gave top priority to the improvement of infrastructure performance. As a result of the steps taken, three key sectors—power, coal and railways—showed distinct improvement from around the middle of 1980-81—a trend which has continued in the current year.

The generation of power in the second half of 1980-81 was 13 per cent higher over the corresponding period of the previous year. Coal production (including lignite) which had remained stagnant around 106 million tonnes since 1976-77, showed a remarkable improvement, exceeding 118 million tonnes. The movement of freight by the Railways also augmented significantly.

With these improvements in the infrastructure, and as a result of the deliberate thrust given to it, industrial production started picking up steadily. The index of industrial production increased by 2.1, 7.1 and 9.1 per cent respectively in the second, third and fourth quarters of 1980-81.

This rising trend of economic activity has continued. During the first quarter of the current financial year, power generation increased by 19.2 per cent, coal production by 6.2 per cent, steel production by 20 per cent, cement production by 20 per cent and the Railways goods traffic by 14 per cent over the corresponding quarter of the previous year.

The production of 29 major industries, for which figures are available, increased by 19.1 per cent during April-May 1981 over the same period a year ago.

We are trying to do all that is needed to bring the economy back on to its path of steady growth—a path which we have tried to build through three decades of development efforts and planning. We must tone up the management of the economy. We want to provide incentives to producers in agriculture and in industry.

At the same time we have to ensure that middle sections get essential commodities at reasonable prices. We are determined to control inflation and to keep a firm grip over the economy by building up our stocks of essential commodities and releasing them in a progressive manner whenever necessary to check prices and to meet priority demands.

With these objectives, the Government, over the last few weeks, has been engaged in working out certain measures. One such measure decided some time ago is the importing of wheat.

As you know, the production of foodgrains last year was a record 133 million tonnes. Although weather conditions were not as good as in the previous peak year of 1978-79, food production exceeded that year's figure by more than a million tonnes, and by about 22 per cent compared to 1979-80.

Wheat production during this rabi season has also been a record one—36 million tonnes. I have no doubt that, in terms of availability of foodgrains, our situation is very comfortable. The total stocks of foodgrains with the Government on July 1, 1981, was more than 13.7 million tonnes—which by any criterion, is quite good.

When there is availability it is the time to build up substantial stocks so that we do not have to take chances and are not at the mercy of traders and hoarders withdrawing supplies from the market. This decision was taken to avoid any sharp increase in foodgrains prices, and as an instrument of control of the economy. This wheat can be released as and when it is necessary to combat pressure on prices and the machinations of traders and hoarders.

In fact, similar steps are being taken with regard to other essential commodities. Oilseeds production last year was 25 per cent higher than the previous year. Still the prices tended to go up in several areas. We have decided to import 5 lakh tonnes of edible oils in the next four or five months.

It is same with sugar. Sugar production this year is 52 lakh tonnes compared to 38.59 lakh tonnes last year. We expect a much higher increase in sugar production in the coming season.

But to keep complete control over sugar prices, we are importing a substantial quantity which will arrive in the next few months. I want to assure the Indian people that all this is part of our total strategy of keeping control over prices and over economic management as a whole.

Every avenue is being pursued to cut Government expenditure and make its functioning more efficient. But the burden on Government has increased and is increasing in terms of the work-load and even more so financially. The augmented and urgent needs of defence have added considerably to this burden.

Our Five Year Plan for science and technology will take us further towards self-reliance. The second unit of the Rajasthan atomic power station is now in operation.

The Kalpakkam and Narora projects are in an advanced stage. Narora's import content is as low as 9 per cent. We have decided to locate our fifth atomic power plant in Gujarat at Kakarapara.

Now a few words about relations with our neighbours. Our Foreign Minister recently visited Pakistan and the Chinese Foreign Minister was here a few days ago. It is well known that it was I who took the first crucial and difficult initiatives for better relations with our immediate neighbours.

We believe in strengthening friendship with all so as to improve the climate for peace. I want the people of Pakistan to know that we wish them well and we want to live in peace with them. Our countries face similar economic problems and we should bend our energies towards development which can be possible only if there is tranquillity and mutual trust. That is the message I sent to President Zia.

We also concede that every nation should be able to defend itself. However, our entire country is deeply concerned that Pakistan is acquiring such sophisticated aircraft. The F-16 represents the induction into this region of a class of aircraft a generation ahead of anything operating with other airforces of the area.

The other plans are all of the late 1960 or early 1970 technology. The F-16 on the other hand is an advanced aircraft of late 1970 technology and operational capability.

In the offensive role it can go much further and can carry bigger bomb loads. The offensive strike capability of even one such aircraft is at least three times that of MIG-21. The PAF, even without the F-16, already has, and will continue to have for some years, a deep strike force three times the size of our own.

Thus the subcontinent is being willy-nilly pushed into an arms race increasing financial burden on our people at a time when our limited resources should have been entirely used for the needs of our people and to make up for lost time in technological and scientific progress.

We cannot pretend that the bilateral relations between China and India have been good. But we want to improve them and we have stretched out the hand of friendship. The issues between us are most difficult and emotional. But nothing can be solved without basic goodwill and effort.

The shocking assassination of President Zia-ur-Rehman shows the instability which many developing countries are facing. We in India are vigilant and shall take all necessary steps to safeguard our interests.

India cannot afford the emergence of parochial and sectarian groups or any slowing down of production. We must all stand united and disciplined, sharing the hardships so that should any external threat arises, we are able to face it with the collective determination of the entire nation.

CDS ordinance

Following is the text of The Compulsory Deposit Scheme (Income Tax Payers) Amendment Ordinance, 1981 promulgated by the President on July 11 :

Promulgated by the President in the thirty second year of the Republic of India.

An ordinance further to amend The Compulsory Deposit Scheme (Income Tax Payers) Act, 1974.

Whereas Parliament is not in session and the President is satisfied that circumstances exist which render it necessary for him to take immediate action :

Now, therefore, in exercise of the power conferred by clause (1) of article 123 of the Constitution, the President is pleased to promulgate the following ordinance :

Short title and commencement

1. (1) This ordinance may be called the Compulsory Deposit Scheme (Income Tax Payers) Amendment Ordinance, 1981.

2. (2) It shall come into force at once.

Amendment of Section 4, 38 of 1974

In section 4 of The Compulsory Deposit Scheme (Income Tax Payers) Act, 1974 (hereinafter referred to as principal act) in sub section (1)—

(A) In clause (ii), the 'and' occurring at the end shall be omitted,

(B) For clause (iii), the following clauses, shall be substituted, namely :—

"(iii) For the assessment year commencing on the 1st day of April, 1979, the assessment year commencing on the 1st day of April, 1980 and the assessment year commencing on the 1st day of April, 1981 at the rates specified in paragraph C of the schedule, and

(iv) For the assessment year commencing on the 1st day of April, 1982 and the assessment year commencing on the 1st day of April, 1983 at the rates specified in paragraph D of the schedule."

Amendment of the schedule

3. In the schedule to the Principal act

(A) before the provision, the following paragraph shall be inserted, namely :—

(i) Where the current income exceeds Rs 15,000 but does not exceed Rs 25,000—4.5 per cent of the current incomes.

(ii) Where the current income exceeds Rs 25,000 but does not exceed Rs 35,000—Rs 1,125 plus 11 per cent of the amount by which the current income exceed Rs 25,000;

(iii) Where the current income exceeds Rs 35,000 but does not exceed Rs 50,000—Rs 2,225 plus 12.5 per cent of the amount by which the current income exceeds Rs 35,000;

(iv) Where the current income exceeds Rs 50,000 but does not exceed Rs 70,000—Rs 4,100 plus 15 per cent of the amount by which the current income exceed Rs 50,000;

(v) Where the current income exceeds Rs 70,000—Rs 7,100 plus 18 per cent of the amount by which the current income exceed Rs 70,000;

(B) In the Proviso, in clause (B) after the word and letter 'paragraph' the words and letter 'or paragraph D', shall be inserted.

Income Tax (Amendment) Ordinance, 1981

Following is the text of The Income-Tax (Amendment) Ordinance, 1981 promulgated by the President on July 11 :

The Income Tax (Amendment) Ordinance, 1981 promulgated by the President in the thirty-second year of the Republic of India.

An ordinance further to amend The Income Tax Act, 1961 and The Wealth Tax Act, 1957.

Whereas Parliament is not in session and the President is satisfied that circumstances exist which render it necessary for him to take immediate action.

Now, therefore, in exercise of the powers conferred by clause (1) of article 123 of the Constitution, the President is pleased to promulgate the following ordinance :—

Short title and commencement

1. (1) This ordinance may be called The Income-Tax (Amendment) Ordinance, 1981.

(2) It shall come into force at once.

Insertion of new chapter XXB

2. In the Income Tax Act, 1961 (hereinafter in this 43 of 1961 chapter referred to as the Principal Act), after chapter XXA, the following chapter shall be inserted, namely :—

'Chapter XXB

Mode of repayment of certain deposits

Requirement as to mode of repayment in certain cases to counteract evation of tax.

269T. No company (including a banking company) co-operative society or firm shall repay to any person any deposit made with it otherwise than by an account payee cheque or account payee bank draft where the amount of such deposit, or where the amount of such deposit is to be repaid together with any interest. The aggregate of the amount of such deposit and such interest, is ten thousand rupees or more.

Provided that where the repayment is by a banking company or co-operative bank, such repayment may also be made by crediting the amount of such deposit to the account (if any) with such a company or bank of the person to whom such deposit has to be repaid.

Explanation: For the purpose of this section.

(i) 'Banking Company' shall have the meaning assigned to it in clause (A) of the Explanation to sub section (8) of section 4 (A).

(ii) 'Deposit' means any deposit of money which is repayable after notice or repayable after a period.

Insertion of New section 276 E failure to comply with the provisions of section 269 T

3. After Section 276D of the principal act, the following section shall be inserted, namely :—"276E. If a person, without reasonable cause or execuse, fails to repay any deposit referred to in section 269T in accordance with the provisions of that section, he shall be punishable with imprisonment for a term which may extend to two years and shall also be liable to fine equal to the amount of such deposit."

Amendment of Section 278A

4. In Section 278A of the principal act, after the words, figures and letters "or section 276CC", the words figures and letter "Or section 276E" shall be inserted.

Amendment of Section 279

5. In section 279 of the principal Act, in sub-section (1), after the words, figures and letter "section 276D" the words, figures and letter "Section 276E", shall be inserted.

Remember
the date
for filing
YOUR TAX RETURN

Ordinarily 30th June is the last date for filing Income-tax and Wealth-tax returns. However, persons engaged in business or profession can file their returns before the expiry of four months from the end of the accounting year or 30th JUNE whichever is later. The information in the tax return should be correct & complete and no false claim should be made. Correct form of return should be used, viz :

Form No. 1 For Companies
Form No. 2 For persons engaged in Business or Profession.
Form No. 3 For assessees whose total income does not include income from Business or Profession.
Form No. 3 A For assessees (including companies) claiming exemption under section 11 of IT Act, 1961.

Return forms can be obtained free of charge from the Income-tax Officer or from the Public Relations Officer in the Office of the Commissioner of Income-tax. Income-tax Return Forms No. 2 and 3 are also available at selected Post Offices for 30 paise each.

Remember to fill up ITNS-224 as an Annexure to the Return. This facilitates expeditious disposal of rectification applications, appeal effects & grant of pending refunds etc.

Tax due on the self-assessment basis after taking credit for pre-paid taxes, should be deposited & counterfoils of advance-tax and self assessment tax paid along with receipts of LIP, CDS and certificates of tax deducted at source should be enclosed with the return.

timely submission of correct & complete return is the best security against tax worries

COVER STORY

Payments crisis in stock exchanges

By SURVEYOR

THE Financial Express, Bombay, regional equity index scaled new peak of 172.42 against the previous week index of 161.28, with sizable gain of 11.14 points over a period of one week only. Popular scrips such as TELCO, TISCO, Kinetic Engg, etc reached new high water mark of prices, and the share market was never better. However, the market took a sudden and steep downward turn within a few days only owing to a number of factors, more particularly because the share prices of a few sprips, and reached dizzy heights as a result of manouverings and over-trading in the forward market. But despite the heavy erosion of prices in the first week of July, the prices continue to be artificially high. There were too sharp variations in the prices of a number of scrips in too short a time, which fact was bound to create difficulties for the market. (Table I).

In May 81, the share market functioned only for 11 days, and remained closed for a number of days. But from 27th June onward, the share market has remained closed continuously (with the exception on 2nd July) ostensibly for the purpose of completing the settlements work. The closure of share market for so many days is itself an abnormal phenomenon. However, the crisis in the share market is much deeper than the eyes can see. It is said that though the share market has faced many a crisis in the past created by heavy slump in prices, it is facing the crisis created by steep rise in prices of scrips, for the first time. It is a new experience altogether for the share market.

There are rumours floating that some of the big brokers are likely to face payment difficulties owing to wide variations in the prices within the period of one settlement only. But the Bombay Stock Exchange authorities are at pains to explain, that there is no financial crisis in the share market, and no broker firm has defaulted in payments, since April last, when one Bombay broker defaulted in payment (to the estimated extent of about Rs 20 lakhs). They point out that the closure of the market has been necessitated because of the non-cooperation and go-slow policy of the staff of the brokers, which is pressing for better wages and working conditions, and a reasonable share in the prosperity of brokers resulting from tremendous increase in the volume of business.

Further, it is pointed out that the recent unprecedented spurt in the prices of some volatile scrips was the direct result of Tata group of companies' reported decision to go in for liberal bonus issue, and policy of generous distribution of dividend by a number of companies. (Colgate's latest announcement of dividend was 110 per cent). It is argued that the abnormal rise in the share business is on account of ever-increasing number of investors, who are keen to invest their surplus funds. But it would be observed that phenomenal rise in the prices was in the case of a few scrips only, which caught the fancy of speculators, and over-trading was mainly in the case of forward scrips. Therefore, it is obvious that the present crisis in the share market is on account of speculative activities only, which of late grew massively.

There are about 300 firms of share brokers in Bombay, and about 80 per cent of these brokers are reported to be doing forward trading to a considerable extent. It is said that about half a dozen big firms of brokers are indulging in reckless speculative business, and two or three of these firms are likely to face acute financial difficulties, if the settlement of the outstanding business is completed. It is also alleged by some persons that these big speculation-sharks are instigating the share-market staff union to adopt an agitation attitude, so that they may have an *alibi* for not submitting the returns about their outstanding business in time, as required by the stock exchange authorities.

It is important to note that the returns, which were due for 19th June and 3rd July settlements are still pending with most of the brokers, (5th June settlement is also reported to be pending in

N B.: Many of the events that took place in the second fortnight of June1981, were unprecedented in the history of stock markets in India. For example, TELCO had the distinction of sharp rise in it price by about Rs 300. (It was quoted at Rs 830 at its highest in the kerb deals on 26-6-81), within period intervening between two settlements only (to be exact within 10 days only), and its price rose by Rs 100 approximately. in the course of one single day. Similarly. TELCO also suffered the heaviest fall for any single day on the announcement of 2 : 5 bonus. for it fell short of the market's high expectations. This was sharpest ever rise in the prices of any scrip in India, it is said. Another share, Premier Automobile, which was selling for about Rs 50 not long ago, rose as a resut of allegedly inspired speculative support to Rs 298, in the course of a few months only, notwith standing the fact that the company has skipped over the dividend continuously for a number of years, and in 1979-80 alone, it suffered the net loss to the extent of Rs 34.75 per share.

COVER STORY

part). It is true that share-market is an integrated market, proper functioning of which depends on the cooperation of all the brokers. If even one firm is not in a position to submit the necessary returns on the settlement day, it will result in non-completion of the return by many other broker-firms. The stock exchange authorities certainly have the powers to penalise such broker-firms, as do not submit the returns in time. But it is pointed out that no action is possible, when almost the entire community of share-brokers is at fault.

In the second fortnight of April 1981 there were some positive indications of speculators getting increasing hold over the share market operations. Therefore, on 29th April, Bombay Stock Exchange authorities took certain drastic steps to curb the reckless speculation. The jobbing was totally banned in the scrips included in cleared list, and the brokers were not allowed to increase their commitments in these scrips, though they were allowed to square-up their outstanding transactions. Moreover, the squaring up in the scrips included in the list "A" was to be done at the prices not exceeding those prevailing on 29th April.

However, on 29th May the position was reviewed as, according to the stock exchange authorities, there was perceptible improvement in the market conditions, and it was decided to restore gradually the normal functioning in the list "A" scrips Jobbing was restored and restrictions regarding the maximum prices of the scrips were also withdrawn totally on May 29. But with regard to the selected 17 volatile scrips, each broker was allowed to have maximum business upto Rs 10 lakhs in a month, subject to the maximum business upto Rs 3 lakhs in any one of the 17 scrips.

It is alleged in some circles that these relaxations, were made under the pressure from big broker-firms, whose major interest was to revive their speculative business. It may be of interest to point out that the limits of the business by each broker were later on raised from Rs 10 lakhs to Rs 15 lakhs, in case of total maximum, and from Rs 3 lakhs to Rs 5 lakhs in any one of the 17 scrips. However, the brokers could very well exceed these limits on payment of additional 'deposit' to the stock exchange (a term used in place of 'margin', to avoid impression that forward trading was going on). The top brokers were reported to be quite willing to make additional deposits as and when necessitated by their excessive speculation business.

It may be recalled that forward trading in shares had been banned as early as in 1964. However, forward trading has been going on as merrily as before without any obstacle, on so-called 'cash basis' with provision to square up the accounts every fortnight. However, the speculators have all the facilities of carrying over their deals from one settlement to another after paying the difference between the initial buying or selling rates, and the notional offsetting selling or buying rates fixed at the time of the settlement. This is nothing short of regular forward trading.

It is well known that hundreds of jobbers have been carrying on their roaring business without having any stock in their hands, or any intention whatsoever to acquire the stock. What makes it worse is that sizeable speculative activities are going on outside the fold of regular stock exchange mechanism. There are private settlements between the operators themselves without any information whatsoever to the stock exchange. Even 'badla' payments are made privately. Kerb dealings among the speculators are a regular feature, which give the semblance of non-official ring for carrying on the forward transactions almost daily. Only after certain members were admonished for this flagrant violation of rules, the venue of this activity shifted from the lane by the side of old Bombay stock exchange building to a nearby street, more open and spacious !

It is said in some knowledgable circles, that some of the big broker-firms have become law unto themselves, and the stock exchange authorities are not in a position to discipline them. Rather, their influence is reported to be working in a subtle manner, while decisions are taken by the stock exchange authorities regarding any matter affecting their interests.

There are of course obvious reasons for hectic speculative activities in the share market. Funds are being diverted in substantial degree from other markets to the stock-market, which at present provides better chances to earn quick money. With the pumping in of huge funds, white or black, to the share market, the speculative activity is the natural outcome. There is too much surplus money chasing too small a floating stock of the scrips, having attractive capital appreciation prospects. The result is that the market prices of the popular scrips are boosted artificially, without any basis or logic. These days the 'yield' on capital investment in the shares has almost ceased to be a factor determining the market prices of the shares. The sole cor sideration at present seems to be th chance of earning quickly and substar tially through rise in prices, as a resul of superficial boom-conditions. This cer tainly is not a healthy phenomenon.

No doubt, with the increasing industrialisation, formation of more and mor companies, as well as increasing accumulation of surplus funds with certain classes of people, more and more people ar looking for attractively profitable avenue for investing their funds. The share market appears to be the inevitable choice While according to an estimate ther were only two million shareholders in th country in 1965, their number has rise to 3.5 million now. About half of th total amount of paid-up capital in non government public limited companies i owned by the individual shareholders while the joint stock companies, trusts and financial institutions etc having vas resources at their disposal, hold the othe half. Table II would give an idea abou the growth pattern of the listed stock i India.

It will be seen from the table tha while the number of non-government public limited companies went down from 10,129 in 1946 to 8,900 in 1979, thei paid up capital went up from Rs 30 crores to Rs 3.120 crores. Moreover, i the same period, the number of liste companies with eight stock exchanges i India almost doubled up, and the tota paid up capital of the listed companie at Rs 2,970 crores was 95 per cent of th total paid up capital of the non-government public limited companies in 1979 Thus there was 1,000 per cent increas over 1946 in the paid up capital of th listed companies, which explains hecti increase in the volume of share-business The number of the listed companies i going up by about 100 per year, an with the passage of time their number i bound to go up at much faster rate.

Similarly, the amount of new issue has also been increasing year after year While in 1961-62 to 1970-71 the averag annual capital issued was to the tune o Rs 47.4 crores, it rose to Rs 71.6 crore in the decade 1971-72 to 1980-81. Th capital issues during 1980-81 itself wer to the tune of Rs 94.2 crores, and th same are expected to touch a record o Rs 250 crores during 1981-82. The public issue of equity capital by the FER companies, consequent upon their Indianisation, played a very significant role in attracting a large number of new investors, and giving large philip to the capital market.

Table II: Growth pattern of listed stock

As at 31st December	1946	1961	1979@	increase in 1979 Over 1946	increase in 1979 Over 1961
No. of Non-Government Public Ltd. Companies	10,129	6,702	8,900	— 12	33
No. of Listed Companies	1,125	1,203	2,133*	90	77
Listed Companies as % of Non-Government Public Ltd. Companies	11	18	24		
Paid-up Capital of Non-Government Public Ltd. Companies (Rs crores)	306	946	3,120	919	229
Paid-up Capital of Listed Companies (Rs crores)	270	675	2,970	1,000	340
Paid-up Capital of Listed Companies as % of Paid-up Capital of Non-Government Public Ltd. Companies	88	71	95		

@ Figures of number and paid-up capital of joint stock companies are estimated.
* (a) The number of listed companies at present may be approximately 2,300.
b) Out of this number, the maximum number of companies i.e. 935 were listed at Bombay Stock Exchange. This number has risen to about 1,300 now.

Nevertheless, with the increase in the number and quantum of new issues, investing public is responding very enthusiastically to these issues. During 1980, out of 163 equity offers to the public, 131 were over-subscribed. Out of these 131 over subscribed issues, 115 were over-subscribed up to 5 times, 8 issues from 5.1 to 10 times, 6 issues from 10.1 to 20 times, and 2 issues more than 20 times. This record has been surpassed further during first half of 1981, when one public issue was oversubscribed 72 times. During this very period the largest over public issue of Gujarat Narmada Valley Fertiliser Company for Rs 23.6 crores is reported to have been over-subscribed three times. According to one estimate, about Rs 275 crores of public are locked up in the new issues at present. All these facts go to prove amply that there are huge surplus funds with the public seeking suitable investment, and the number of investors is increasing at a very high rate every year. It would not be surprising, if a sizable number of persons having substantial surplus funds are tempted to become richer quickly through indulging in reckless speculative business also.

The present crisis in the share market, which is likely to take turn for the worse as a result of feared default by a few brokers, has naturally prompted all concerned to ponder as to how the repetition of a similar situation can be avoided in future at least. Some people including a few investment brokers suggest that the forward trading in the shares should be abolished in all its forms. It is learnt that in fact there was a suggestion by Bombay Stock Exchange authorities in a meeting with brokers on July 6 that all the scrips in list "A" (cleared list) should be transferred to the list "B" (cash list). The net effect of implementing this suggestion would be that all the dealings in shares will strictly be on spot delivery basis, and there will be practically no scope for any speculative business. It is reported that the idea of abolishing list "A" completely was supported by an overwhelming majority of the brokers participating in the meeting. However, it is feared that ultimately this suggestion may not be approved by the Board of Directors of Bombay Stock Exchange, under the pressure of the top brokers, whose main interest is in speculation. It may be recalled in this context that scrips like IOC, Bajaj Auto and Century Enka etc have already been transferred by the Bombay Stock Exchange from list "A" to list "B". On the same analogy there should not be any objection to transfer, all other scrips (or at least the volatile ones) from list "A" to list "B" in order to stop unhealthy speculation, and create an atmosphere of confidence amongst the investing public.

It is argued that forward trading even in a limited degree, goes a long way to ensure the liquidity of the shares, which is their main attribute. It is generally agreed that the abolition of the cleared list, will no doubt reduce the liquidity of shares. Yet the investment brokers contend that this step will not affect the genuine investment activity to an undesirable extent. The recent statement of Union Minister for Finance, Mr R. Venkataraman at Ahmedabad on July 2, 1981, made it quite clear that the Government was well aware of the speculative activities in the stock markets. Is it not then the duty of the Government to find out as to how speculation in shares in still going on, when forward trading in shares has since long been banned legally? Further, should the Government not take effective steps to enforce the ban in a meaningful manner, if some desperate speculators are bent upon circumscribing the law? It is feared that the refusal of Union Finance Minister to intervene in the present financial crisis as the result of reckless speculation in the stock markets, may embolden the speculators to indulge further in their undesirable activities.

However, even if for some compelling reasons, it is found necessary that the society should learn to live with forward trading activities in the stock market, it is high time that certain measures are taken by the Government as well as the stock exchanges to bring the forward trading under strict, really effective, and meaningful control. Probably the least which must be done in this regard is to introduce the practice of 'margin trading', under which every operator buying or selling the cleared scrips would be under legal obligation to deposit certain margin money with the brokers, say 20 to 25 per cent of the market value, to cover the variations in prices. The brokers also should deposit the corresponding amount with the stock exchanges. In fact, the 'margin trading' is already in vogue in USA and some western countries. This system would compel the operators to limit their operations according to their means, curb their tendency to gamble, and desist them from manipulating the market.

The stock exchanges will also have to be more vigilant and strict than at present, in getting their instructions carried out by the broker community. At present the functioning of the stock exchanges in India is regulated under the Security Contract Regulation Act 1956. It authorises the Union Government to issue guidelines to the stock exchanges and control their functioning, particularly through its nominees on the board of directors of the stock exchanges. It is said that generally the government nominees on the board of directors of the stock exchanges have neither the necessary professional knowledge of the technicalities of the share market, nor they have any inclination to learn them, for their continuance on the boards of directors is rather an uncertain factor. On the other hand the powerful brokers see to it that the boards of directors of the stock exchanges do not take such decisions as are likely to affect their interests adversely. It would be worthwhile to have a second look on the relevant law, and make it incumbent on the part of the

COVER STORY

boards of directors of stock exchanges to enforce the required discipline among the share brokers, and make them resfect fully the rules and regulations made by the stock exchanges. Complete computerisation of the work in stock exchanges may also help a great deal in this respect. However, strengthening of the staff of all the stock exchanges with a view to keep pace with ever-expanding volume of business would also be necessary. The Bombay Stock Exchange is having the same strength of staff, which it had two decades before, despite manifold increase in the business. Naturally, it has resulted in the excess load of work on staff, which in turn is resulting in discontentment. Similarly, the stock exchange authorities should also ensure that the staff of the broker-firms is also given a better deal, and it is enabled to have its legitimate share in the profits of the broker-firms.

It will be relevant to observe here that the membership of the stock exchanges in India is highly restrictive and there is practically no scope for increasing the number of their members, entitled to carry on broker-business to cope up with speedy expansion of the share-trading activities. On Bombay Stock Exchange, for example, there are about 450 active members working in about 325 broker-firms. The number of members and broker-firms has not increased much during last three decades despite the fact that the stock exchange business has multiplied many many times. It would be worthwhile to consider as to how the number of broker-firms can be increased to deal conveniently with the new share-business. Further, in a place like Bombay it is extremely difficult for the broker-firms to secure additional space to facilitate the employment of more staff to look after the new business. These limitations are bound to result in delay in attending to the required paper work. However, if the procedure and the paper work required for transfer of shares and other similar matters is simplified significantly, and reduced to the minimum, much more work can be attended to by the existing staff only. Activities on share markets in the western countries have reached phenomenal heights, and in order to keep pace with the changing times the stock exchanges there, have modernised their functioning. There is only four-day delivery period in most of the western countries instead of 15 days in India. With huge expansion of share market in India, can we not adopt similar practice in this country, as well ? The reduction in delivery period will certainly curb the speculative business as well.

The present crisis in the share markets, particularly at Bombay, which is the biggest and most popular, must serve as an eye opener to the Government and the stock exchanges. The top priority would have to be given to get the pending settlement work completed and payment position sorted out. No doubt there is lurking danger that as a result of completing the settlement work, some payment difficulties may arise for a few firms (already two brokers of Ahmedabad are reported to have defaulted, and the amount involved is estimated at about Rs 25 lakhs). However, the inevitable has got to be faced. Quicker the better. It is high time the Bombay Stock Exchange authorities take up the task more seriously and expeditiously in the overall interest of maintaining a healthy investment climate. It must take firm and effective steps to resolve the present crisis without waivering any further.

Fresh guidelines for stock exchanges?

From OUR SPECIAL CORRESPONDENT

BOMBAY

ALL is not well with the functioning of Dalal Street, the premier stock exchange in the country, for quite some time. Whatever happens on the Bombay Stock Exchange normally has its repercussions on other stock exchanges in the country.

The stock exchange has been downing its shutters quite often. This step has been taken by the stock exchange authorities mainly because of non-completion of the settlement work in time. Currently, work with regard to two previous settlements is to be completed. Inquiries from stock exchange circles indicate that this is being deliberately avoided by a few interested parties who are stated to be facing payment difficulties.

No doubt the stock exchange authorities are trying their best to sort out the difficulties. But their actions have their own limitations. With rampant speculation that has become the order of the day on Dalal Street in the current sustained bull phase, such situation is bound to arise.

Some large speculators are stated to be encouraging the Share Bazar Staff Union to continue their agitation by putting forward some new demands at this time. These speculators seem to be bidding for time to settle their deals on the stock exchange.

In the past two and a half months, the Bombay Stock Exchange has functioned normally for only a few days. On May 2, the stock exchange authorities enforced several restrictions on trading with the intention of limiting the activity. Three weeks and two settlements after they were rolled up, the authorities downed shutters once again towards the end of June. This had become necessary because the settlement work had not been completed properly. The decision by the authorities to remove restrictions on trading in all scrips other than 17 cleared scrips helped the speculators to go ahead with their plans. Moreover, at the turn of the settlement on June 5 the authorities failed to use their last weapon of fixing clearing rates with a difference from the ruling rates for both bulls and bears. Moreover, the aggregate value limit for fresh sales and purchases in cleared shares was doubled to Rs 20 lakhs and the scripwise restraint was raised from Rs 3 lakhs to Rs 5 lakhs.

Removal of restrictions one by one naturally led to the exposure of the market to wild spree of speculative activity. This in turn led to accumulation of huge payments in the two settlements which were concluded on June 19 and July 3. Although the market was open officially for one day on July 2, in kerb deals speculators were playing havoc. For example, Tata Locomotive were lifted in kerb deals from the official closing of Rs 734 on June 26 to a new high of Rs 860 after the company notified to the stock exchange that the board would consider the question of issue of bonus shares along with accounts for 1980-81 and declaration of dividend for the year. However, in the official trading on July 2, the shares were marked down to a low of Rs 685 since the maintenance of equity dividend at 20 per cent and the announcement of a bonus issue in the ratio of two for five fell far short of the general expectations in the share market circles. Other pivotal counters also showed wide fluctuations during the period, although the range varied from counter to counter.

Inquiries with marketmen indicate that these wide fluctuations have led to payment crisis on the stock exchange. A few big operators who have lost in one settlement and gained in another have been insisting that the work with regard to both these settlements should be settled together. Since many others may not be willing to accede to their request, they are stated to have encouraged the Share Bazar Staff Union to raise their fresh demands at this time. Payment difficulties and failure of even a few big parties to honour their full commitments have wide ramifications not confined only to a few speculators but also from the viewpoint of the smooth functioning of the market. Normally, the share brokers try to get over such crisis in the market, but some innocent brokers have to suffer heavily for no fault of theirs. Small investors also suffer in the bargain. These who have paid for the shares they have bought do not get delivery of their shares and those who have sold their shares are not able to realise their monies in view of the non-completion of the settlement work in time. Unless pay-in and pay-out in any particular settlement is completed, share brokers are unable to settle the transactions entered into with their clients. Some investor brokers who have deals with upcountry share brokers or sub-brokers are put to lot of difficulties. They have to honour hundies of such upcountry brokers, while they are unable to draw hundies on the upcountry brokers in the absence of non-completion of deliveries through the stock exchange clearing house.

Accumulation of large payments by a few parties have naturally raised doubts whether it would be paid up by the concerned members, particularly since there have been very wide fluctuations in several leading counters like Tata Steel, Tata Locomotive, Century, Baroda Rayon, Scindia and Great Eastern Shipping, in the kerb deals. Rumours are frequently current in the market and some parties are unable to honour their commitments and might turn defaulters. In the event of a few big operators failing to honour their commitments, the market's liquidity will be hampered greatly.

Frequent reports that the Union Government is considering a package of anti-inflationary measures including restraints on dividends has also dampened the market sentiment of late. In view of this, the trend on other stock exchanges has also been distinctly weak. This in turn has led to some payment difficulties by a few brokers on Ahmedabad and Calcutta Stock Exchanges in the recent past. Thus operators on the Bombay Stock Exchange have not been able to divert their attention to other markets.

It cannot be gainsaid that the weapons with the stock exchange authorities to deal with such extra-ordinary situations are not enough. Wide fluctuations and the big volume of business have been possible only because the reckless speculators have the facilities for carrying over their deals from one settlement to another by paying budla or contango charges. Since the regulations with regard to payment of margins are not enforced strictly — and this is not possible for the stock exchange authorities since a large volume of deals by these big operators are settled outside the market and then brought into the books of stock exchange at a convenient time to them — and since the stock exchange authorities are unable to fix clearing prices which will penalise both the bulls and bears as the case may be, the stock exchange becomes vulnerable to the rampant speculative activity by a few interested parties. No doubt, these big operators are able to go ahead with their plans only because they have a following of large number of small investors. In view of the large investible funds being diverted to the stock exchange in the current sustained bull phase and in view of the entry of a large number of new investors in the market who have benefitted from the current bull phase, big operators are able to lift shares with little support disproportionately to their intrinsic value or push down some shares by pressing sales to their advantage. The current deals on the stock exchange are nothing short of forward trading, which is officially banned.

The stock exchange authorities are trying their best to complete the pending work of the previous settlements and complete the payments with regard to these pending settlements. However, their efforts have been hampered by the agitation by the Share Bazar Staff Union, which has refused to oblige unless their demands are settled. The stock exchange authorities are, therefore, trying to attack the situation on both these fronts. How far they succeed remains to be seen.

However, the process of completion of work in respect of previous settlements has to be gone through, however, painful it might turn out to be. Unless unwound, excess is bound to seep through and disturb the health of the market. The excessive activity noticed in the recent settlements will have to be scaled down compulsorily over a given set of settlements. As custodians of the country's leading stock exchange, the authorities of the Bombay Stock Exchange have added responsibility. They owe a sense of obligation not only to their own members but also to the stock market fraternity all over the country. Bombay's ramifications are not restricted to itself. They are bound to spread to other stock exchanges also, as had happened in the past.

Reports are that the Government is evolving fresh guidelines for stock exchanges to check irregularities in their operations. This would indicate that the authorities have realised that it not possible to effectively control the working of the stock exchanges with the existing regulations. This could be because of the shortage of staff.

The Government is reported to be thinking of tightening the present system of benami share transfers. How far it succeeds in this respect would be watched with interest in concerned quarters. The Government also wants that the stock exchanges computerise their operations progressively. It is also stated to be considering proposals for fixing a minimum scale of brokerage as a further curb on speculation. However, enforcement of such a measure may have its own limitations. Some regulations for companies with regard to closure of books and the subsequent work related there to or notification to the stock exchanges about bonus issues are also stated to be in the pipeline.

COVER STORY

Bouts of speculative fever

From OUR SPECIAL CORRESPONDENT

CALCUTTA

ALTHOUGH it lacks the drama, excitement and the turbulence of the Bombay Stock Exchange, Calcutta has had its own bouts of speculative fever. Right now what could be just speculation about certain companies' prospects, mostly belonging to the Birla group, has taken their prices well past the best in the previous year. For example, Hindustan Motors rose to Rs 31.70 on July 3 against the previous year's peak of only Rs 12.34; the price of that of India Steamship moved up to Rs 21.55 from only the 80's peak of Rs 12.70; Jayshree Tea went up to Rs 44.75 from Rs 39.85; Kesoram Industries to Rs 46.20 from Rs 43.20; Texmaco to Rs 76 from Rs 60.80; Universal Cables to Rs 60.50 from Rs 45; Zuari Agro-Chemicals to Rs 30.75 from Rs 20.60; Orient Paper to Rs 51 from Rs 44 and Gwalior Rayon to Rs 69 from Rs 51.

The real causes of speculation are not known in each case. But in some cases such as Hindustan Motors and India Steamship expansion and takeover news has been attracting market interest. Hindustan Motors, it appears, has sought the permission of the Central Government to set up a plant in Gujarat with facilities to assemble 7,500 commercial vehicles annually in order to make fuller utilisation of production facilities available at its West Bengal plant in Uttarpara. In its existing Uttarpara factory the company produced only 4,880 commercial vehicles as against an installed capacity of 15,000 vehicles.

Expansion apart, the company has plans to improve the design and technology of passenger cars in collaboration with Vaxhauls of U.K. and also plans to produce Bedford trucks of a payload capacity of ten to 15 tonnes in collaboration with the American General Motors. Hence the share market views the prospects with a rose tinted glass and to cap it all the company's net profit for the latest working year has reportedly improved to Rs 5 crores.

India Steamship share's attractions for the stock market are probably based on the fact that it has acquired or is about to acquire a 39 per cent stake in Nilhat Shipping, a subsidiary of the tea broking firm of J. Thomas & Co. Nilhat Shipping has been a sick company, of course, but under India Steamship's management, its assets can be utilised better, helping eventually India Steamship to improve earnings or so the market thinks.

In the hand delivery section (the section which consists of some 50 soundly managed companies to which the Birla companies mentioned above also belong), the other companies whose shares have been in the limelight in recent weeks are Escorts, Brook Bond, Calcutta Electric, General Electric, Guest Keen Williams, Indian Oxygen, J. K. Synthetics, Straw Products, Shaw Wallace, Shree Synthetics and Usha Martin Black. These are companies reputed for good management and sound financial practice and the rise in their shares is to be attributed to general investor preference for relatively less risky equity in an inflationary economy such as ours is today.

The stock market has also frowned on those which have fallen on evil days like, for instance, Bata India. This company's scrip quotes around Rs 17 which is lower than the lowest quotation of the past year. Another company whose prospects are not fancied is Lipton India whose quotation is now pretty close to the lowest of 1980. Alkali Chemical of the ICI Group (renamed Crescent Dyes) is also quoting below the previous year's lowest market price. This company is passing through difficult days due to raw materials shortage which has forced it to close its Rishra Chemical Factory at present. There is also Birla company, Birla Jute, which has been badly marked down its quotation, falling close to the 1980's low of Rs 28.75. This company's jute business is mainly responsible for a sizable loss in earnings and, like most jute companies, Birla Jute too has been facing rough weather.

This factual description should show that while some shares such as Hindustan Motors, India Steamship and Gwalior Rayon have been enjoying a fair measure of speculative support, the rest are being assessed pretty fairly and there is no overtrading in Calcutta stock market at present. Rather the transactions give the impression that the proceedings are fairly smooth. So one does not visualise a crash or crisis in the near future barring those sections where speculators are at work. But, of course, if the Government takes it to its head that it must freeze dividends or some other drastic measures against the corporate sector then that may well precipitate a crisis. The tight credit policy has not really hurt the stock exchanges, not at any rate Calcutta yet.

Panic in market

From OUR CORRESPONDENT

AHMEDABAD

NEVER in the history of the stock exchange one has heard that a payment crisis developed when the share prices were booming by leaps and bounds. But it so happened in Ahmedabad recently. Two parties have been declared defaulters by the authorities of the Ahmedabad Stock Exchange as they failed to honour their commitments. One party, according to market reports, failed to pay up its commitment to the tune of Rs 20 lakhs while the other one only Rs 1.5 to Rs 2 lakhs.

However, this created panic in the market for few days as barely few brokers have been able to escape from the financial burden due to failure of these parties. About three member brokers have lost about Rs 10 lakhs as the 'big' defaulter did not agree to pay anything.

What is more surprising is that the defaulting party has more outstanding sales in few cash scrips and outstanding purchases in Gujarat Narmada Valley on premium basis. He has also big short sales in shares of Tata Steel which flared up from Rs 100 to Rs 325 within a span of four months.

The failure of these parties in honouring their commitments may be attributed to the negligence on the part of the stock excaange authorities to some extent also as they did not take any drastic action to take deposits or special margins from bears.

Meanwhile, it is also much more surprising that when the pivotal scrips in Bombay were moving up very fast, scrips like Calico, Ambica and Atul dropped sharply in last one year. The management of these companies must find out the reasons for it in the interest of the shareholders and public at large.

Phenomenal rise in prices

From OUR SPECIAL CORRESPONDENT

MADRAS

THE Madras stock market is essentially an investment market with little speculation. Investors seem to pause now and again to see if there is anything better in which to plank their precious resources but find that there are not many stores of value of comparable intrinsic merit to choose from, and therefore just ask for good scrips to add to their portfolio of holdings.

Throughout the last one year there was an unprecedented investor interest on a broad front in all sections of securities. The flow of investible funds in corporate securities has been significantly abundant. Consequently, the volume and frequency of trading in securities increased considerably and there has been a large scale influx of new investors into the market leading to a phenomenal rise in the price of securities. This unprecedented volume of trading in securities did however bring in its train some problems in regard to performance of contracts in time.

The general investment climate for new issues has also improved considerably, during the year. From September 1980 onwards investments in new shares slowly emerged out of the earlier sluggishness with encouraging signs of a distinct pick up in support of new issues. Reflecting a sense of investor's confidence the primary market for new shares had been remarkably brisk from January to June this year. During this period the equity issues by existing companies for additional capital and by new companies for fresh capital were oversubscribed by the public.

This enthusiasm in new issue market may be ascribed to the fact that a majority of shares in the secondary market had reached dizzy heights with diminishing returns and possibility of growth restricted. Secured debentures and convertible bonds have been a novel feature of the primary issue market.

Enquiries show that, by and large, the Madras stock market is currently active with stock brokers having a good turnover. Scrips that are favoured mostly relate to the engineering industry, transport undertakings, textiles and chemicals. These command very good premia in the market and attract good investment. The investment climate in general and on stock market in particular is quite favourable.

The reasons for the growing popularity of the share market in Madras, the one-time Cinderella among cities, are not far to seek. The leftist domination of Kerala economy and the consequent feeling of insecurity have led to disinvestment of even inherited property interests by many Keralites who have of late chosen to settle in Madras.

With agricultural holdings in Tamil Nadu coming under the Land Ceiling Act and with minimum wages being fixed for farm labour without fixing either minimum working hours or output, landholders have stopped further investment on landed property and further application of capital to land they are already holding. These landed gentry migrate to nearby towns and cities and turn to money lending as a business. Of late, however, they have begun to feel that part of their money should go into hedges although the return they bring may compare unfavourably with income from usury.

Besides these internal capital realisations, the inward remittances of those gainfully employed abroad especially in the Gulf countries have also contributed to the pressure on the none-too fast expanding basket of equities with the result that the demand for equities of even middling performers among public companies has been well sustained. This in the main explains why the stock market is robust despite constraints such as coal scarcity and power cuts.

As one prominent stock broker described the local stock market, values are breaking out of the cocoon of traditional concepts and with blue chips companies offering 15 per cent interest, payable quarterly, on fixed deposits, "it is not a surprise that the man who talks about yields on equity is listened to with the same mild interest as the Sunday sermon of a second rate pastor". "All speedy share price appreciations tend to promote a short term outlook and what people are really interested in is what is likely to happen next Monday rather than the probabilities of 1982."

Mr S. Narayanaswamy, partner, Chitra and Company a firm of stock brokers, summed up the current position as follows: "Trading in the stock market is of a mixed pattern and overall business is moderate. Government securities ruled steady. Engineering shares found good support while textiles and plantings ruled dull. Select miscellaneous scrips met with keen demand."

Though the Madras Stock Exchange was established in 1920 within three years membership had depleted. The share brokers continued their business depending mostly on Bombay, Ahmedabad and Calcutta shares. In course of time they felt the need for an organisation to regulate their functions through rules and regulations and the Madras Stock Exchange Association was formed in 1937 and was converted into a company limited by guarantee in April 1957. Currently the stock exchange has a membership of 46. Four hundred companies are listed on the exchange. The number of securities listed as on April 30, 1981 comprise 127 government securities, 418 equity shares, 185 preference shares, 135 bond issues and 38 debentures. The aggregate paid up capital of listed securities excluding government securities is about Rs 1,958 crores.

The stock exchange provides opportunities to individuals to invest their surplus funds while, at the same time, providing a ready marketability for stocks and shares listed in the exchange.

A spokesmen of the Madras Stock Exchange stated that the main diversion of funds to the stock market was due to *FERA* issues which have motivated many individuals to invest in shares to earn surplus profits. *FERA* shares command a fantastic premium and dividend declared on them was also higher than that by other companies. The second reason is the interest rate on bank deposits is comparatively lower than dividends on shares. Same is the case with fixed deposits' interest rate pegged at 15 per cent. Further, investment in shares has always a capital appreciation and dividends upto Rs 3,000 per annum are exempted from income tax. Exemption from wealth tax has also been granted for dividend for income upto Rs 1.5 lakhs. Again those who invest in public issues of new companies are also eligible for certain concessions under the Income-tax Act. These concessions as well as the appreciation of share values have boosted the stock market operations to considerable heights. From a meagre 97 scrips listed in 1937 the Madras Stock Exchange now has on its list 903 scrips.

Restricted trading

From **OUR SPECIAL CORRESPONDENT**

BANGALORE

ONE of the younger ones in the national chain and very zealous of its professional commitment and reputation, the Bangalore Stock Exchange does not seem to be disposed to be sucked into the crisis the senior brother institutions elsewhere are apparently heading to.

Rightly taking a leaf from the experience of the other major stock exchanges, wherein situation had been going haywire, the Bangalore Stock Exchange has opted for precautionary measures in the interest of avoiding and undermining of investor's confidence in it. Its managing council has just taken a decision to restrict trading activities on market to only three days in week, *viz.* Monday, Wednesday, and Thursdays with effect from July 1, 1981. The other two days, *viz.* Tuesday and Fridays have been earmarked for delivery and payments as well as for settlement of transactions which might be outstanding for sometime.

It is explained that this decision was taken in view of heavy transactions taking place currently with market being very active and volume of trading put through by members being sizeable. It had been felt that members were not finding enough time to take delivery of documents and arrange payments since all the while fresh business was taking place leading to piling up of arrears of work. Members have been advised not to trade on those two days of respite but to devote themselves to settling transactions already entered into.

The managing council would review the situation from time to time and would announce resumption of normal trading pattern as soon as outstanding position was brought down considerably.

The Bangalore Stock Exchange is essentially an investment market and a cross section of investors comprise retired government servants, private and public sector employees, small businessmen and people in various professions. With the advent of a few operators, market activities are being transformed and market activity is being enlivened.

Speculative activities, it is pointed out, are also straightened by enlistment of shares in Bangalore official quotations of companies like Telco, Reliance, Larsen & Toubro, Gwalior Rayon, etc, enjoying all India following. Stock exchange authorities had also permitted trading in securities listed on other stock exchanges by members during official trading hours thus adding impetus to very brisk and voluminous transaction floor.

The Bangalore Stock Exchange has taken credit for several innovations in propagating investment philosophy among people and spreading the equity cult to support national economic and development activity from time to time. It holds sessions on balance sheet study and dialogue between exchange and investors. It took the lead in bringing stock exchanges and investors in the southern region on a common platform for concrete action.

COMMERCE ANNUAL 1980

A comprehensive, analytical study on

INFRASTRUCTURE IN THE INDIAN ECONOMY

More than anything else, infrastructural bottlenecks are holding back the growth of our economy. The current crisis in the country's economy can largely be traced to our failure to provide infrastructural facilities like power, transport, oil and coal. If industry's plans have gone awry because of the inadequate development programmes to build the needed infrastructure, the rural areas are suffering because of lack of roads, water for drinking and irrigation and even because of our not paying due attention to evolving an improved bullock-cart. Not that in the past three decades there has not been growth in infrastructural facilities. In fact, it has been phenomenal but it has not kept pace with the planned growth in industry and agriculture nor with the development of urban and rural areas. What are the challenges facing us? Leading experts discuss thoroughly the various issues involved in the 400-page bumper Annual Number. Statewise analysis and a statistical profile of the infrastructure in the Indian economy enhance the value of the Annual as a source of reference.

Is racial violence in the UK unavoidable?

By HARINDRA DAVE

ON June 9, 1981, Yorkshire television network arranged a debate on race relations and it was televised throughout the United Kingdom. One of the participants was a Conservative M. P. Nicholas Winterton. He echoed the sentiments of Enoch Powell by favouring the voluntary repatriation of non-white population. He was of the opinion that 50,000 blacks may be returned to the land of their ethnic origin or birth and Government may pay them some £ 5,000 each. An Asian young man from among the audience got up and smartly cornered Mr Winterton with a query as to how in the present economic crisis, Mrs Thatcher would fetch such a large amount of money? Is she going to sell British Leylands to Japan or British Steel to Germany ? Instead why not repatriate a few hundred Australians like Mr Winterton who are creating all sorts of trouble for racial minorities ?

Again when Mr Winterton remarked that 'your children and my children will have equal opportunities' in the United Kingdom, a Gujarati girl from Leeds stood up and pointedly asked Mr Winterton : "Are you going to stand the humiliation of giving the blood test to prove that your children are your own ? Well, we blacks are supposed to do that." These two dialogues in a revealing and exciting debate, indicate certain basic trends in racial relations in the United Kingdom. At the outset, we are impressed by the strength of democracy in which an unknown Asian youth or a Gujarati girl can challenge a powerful ruling party MP in public. But it also uncovers the deep-rooted suspicions among the minority community which has settled in the United Kingdom since decades. It is one thing when Mrs Thatcher or Mr Winterton say that they will have an equal opportunity but when we put it to practical application it results into inequality which climaxes from the equal treatment to unequals. One remembers the criticism of Anatole France : "The law in its majestic equality forbids the rich as well as the poor to sleep under bridges, to beg in the streets and to steal bread." It is almost a similar situation when national leaders in the United Kingdom talk of equal treatment. Because when whites approach schools for admission of their children, they are not supposed to prove that they belong to the country. But when a black, who came to this country decades earlier, approaches a school for admission of his children, he has to produce his passport to prove that he is a citizen of the United Kingdom and also he has to submit the proof that he is the father of the child.

The situation we confront in the United Kingdom is to be examined from two angles. It is not that all whites hate black and all blacks hate whites. If you move across the streets of London when offices start functioning or in the evening when people go home, you will find a white girl and a black boy walking hand in hand, chatting with bewitching smiles about the day's work. In restaurants, in university campuses and in factories you find blacks and whites merging with each other without any complex in their mind. But politicians like Enoch Powell started talking about the black invasion which according to him, may ultimately result into white people receding into a minority. This gave a misleading shock to the white population of that country. The media there is perhaps the best in the world as far as qualitative standards are concerned. But being controlled by people with conservative persuasion they tend to fan the fire of racism and aggravate the situation by distorted reporting. Some time ago the *Daily Telegraph* reported with a headline "Bradford 'lives on immigration time-bomb' " and went on to say that local community leaders are living on a time-bomb. *Daily Mirror* reported with big headlines that one in two school children will be coloured. In fact the figure showed that it may be only one in 3.35. This type of misreporting also intensifies racial feelings and gives shape to non-existent fears in the white and grave suspicions in black population. One district paper *Telegraph and Argus's* Asian editor, John Salmon who, incidentally, speaks good Hindi and better Gujarati with Parsi accents reported in his newspaper:

"Why is it that "time-bombs"—however fictitious—and "clashes"—however exaggerated—involving Asians and West Indians make "news" while other more constructive activities do not?

"Why is it that some white people regard Asians and West Indians as "a threat" or a "time-bomb" rather than as people or as next-door neighbours? Is it because that is the way they are treated in a lot of the media?

"And is it not possible that, by distorting, exaggerating and inventing problems, the sections of the media actually could be increasing likelihood of real "clashes" or "explosions", which they would then, doubtless, piously denounce?"

It is not only extremists like Enoch Powell who encourage such hatred towards black people. For the first time in British parliamentary elections Mrs Thatcher used this weapon of racial hatred to win popular white support. In 1978 in a television interview she said: "British people are afraid of being swamped by people with a different culture; and drastic cuts in immigration were necessary to keep fundamental British characteristics". This was just a starting point. It emboldened extremist institutions like National Front to propagate the creed of violence against the black.

When we think of the recent incidents of racial clashes in Liverpool, Manchester and other places in the UK, we must look back to come to the inescapable conclusion that these incidents are the culmination of the hatred, systematically spread by white Conservative leaders and supported by some of their Labour and Liberal colleagues in the Westminister. In 1976 Southhall was rocked by the worst ever racial riots. Southhall is an interesting London suburb with the greatest concentration of Punjabi sikhs anywhere in the world, perhaps including cities like Ludhiana, Amritsar and Chandigarh. Since then, such incidents have increased and now the frequency also is more and the nature of the incidents has also been more serious. Right from the incident in January 1976, when an 18-year old student Gurjit Singh Chagger was stabbed and four white boys were taken into custody for the incident, the behaviour of the police has remained strange and not beyond suspicion. At that time they categorically rejected that Singh was a victim of racial prejudices. Today also they defend the display of strength in Brixton in last April which resulted into bloodshed and violence and the recent incidents in which police has, for the first time, used teargas have been aggravating the law and order situation.

Mr Dave, editor of the Gujarati daily 'Janmabhoomi', recently visited the United Kingdom.

We read conflicting reports about the fixation of the blame, but at one point even the western media also agreed that police is slow in taking action against white offenders while they are swift in pouncing upon black suspects. As mentioned earlier, it is not a 'civil war and catastrophe' predicted by anti-black leader Enoch Powell, even as late as March 1981. Except a few areas of conflict, people stay without any problems of racial injustice. But such incidents can build up the future threat and this is what disturbs the black community in the United Kingdom.

Recently I had an occasion to meet a few Asian leaders in Bradford—Mr Ajeeb Ahmed from Pakistan and Mr Busan, Mr Johar and Mr Singh from India. In an informal chat they agreed that there is no imminent threat to most of the immigrants. But they shudder at the thought that a person like Powell may enter into Home Office—a situation not immediately possible but also not unlikely looking to the polarisation that is taking place in British politics. The Nationality Bill, on paper, gives equal rights to legal immigrants but poses certain threats. The Home Secretary can reject a naturalisation application from any immigrant without giving any reason whatsoever. Of course he is bound to take his decision without the prejudice of colour or race. But when he is not supposed to disclose his grounds for rejection how can you conclude that he took his decision justly?

These are the genuine feels. There are unreasonable expectations also. Indians would like to have the best of both the worlds. They want to take British citizenship and want India to grant them the right of dual citizenship. They recall the pledge given by the former Foreign Minister, Mr Atal Bihari Vajpayee, in his Royal Albert Hall speech that if Indians could trace their origin to India, they could have Indian citizenship any time they like. There are practical problems in implementing this pledge. Our Constitution has specific provisions about citizenship and it may not be able to satisfy Indian settlers in the United Kingdom. They have to make an ultimate choice between British citizenship and Indian citizenship. But what happens to them if they choose the former and they are driven out by extremists under the pretext of voluntary repatriation about which many ruling party MPs are talking these days? This is what bothers Asian leaders and this is the point of the campaign of one of the prominent Asian leaders, Mr Praful Patel, who in 1976 managed to get contents of Mr Powell's speech, even before it was delivered.

While the violence in the United Kingdom is still on, I am reminded of my conversation with a Scotland Yard official who politely tried to explain the problems confronting the police when they handle a violent mob. We in India cannot imagine a police force which is unarmed, which does not use fire arms like Diwali crackers as our police force does and which has recently used tear-gas for the first time. His argument was, if a white policeman stops a white man and tells him to remove his car from the wrong parking, all will consider it as a policeman's normal duty. But if the same happens with a black man he will complain that he is being harassed. He defended the excessive presence of plainclothes police in Brixton which, according to some, sparked off the worst riots in that area last April, by saying that without their presence riots would have been still more uncontrollable. One would like to accept his argument, but facts do not support it always. There is an element of racial prejudice in white police which occasionally induces them to take a lenient view of white offenders. Democracy there is still strong and the victims are not so oppressed. So things come out as they are coming out in the Brixton enquiry being conducted by Lord Scarman. Superiors in the police force are becoming increasingly aware of the discriminatory attitude of lower level officials.

All these pose a threat to the immigrant population of the United Kingdom. As Mrs Thatcher says, on paper they have equal rights as Mrs Thatcher herself has. But in practice the colour of the skin prevents them from enjoying equal rights and equal opportunities. If the new generation of white people which is bred in the climate of violent hatred towards blacks which is alarming, Skinheads—a popular term for the young white boys with thinly cropped hair remind us of round heads of Oliver Cromwell's era will grow. They have similar rigid attitudes this time not against cavaliers but against black population. On one evening when a young Indian journalist Kalpesh Solanki was driving me through Silex Street where his father's newspaper *Garavi Gujarat* is housed, we saw young boys of 8 and 10 years with hatred in their eyes, envying a young Indian driving a Mercedes and running behind the car with the intention of stoning it. If the mental attitude of these young boys became widespread and if their representatives sit in Parliament, I shudder to think about the future of black population in that country.

LET *COMMERCE* TAKE YOU TO THE TOP

Commerce is the most sought after economic weekly because it has an established credibility with the top decision makers who need continuous authentic financial intelligence. Your advertisement in Commerce will, therefore, be seen by the key people in Industry, Business and Government. If it is a product you wish to sell or a corporate image you wish to project, Commerce is the most sharply focussed medium available to you.

DATELINE NEW DELHI

Inflation: No instant remedy

From ARVIND BHANDARI

ANY attempt to control inflation has to be based on a long-term drive and not an instant package. The price level in the macro-economic sense is best viewed in terms of inter-action of aggregate demand and aggregate supply. The point of intersection between these two curves has to be prevented from rising, if not lowered. Uptil now the Government's anti-inflationary thinking has tended to be one-sided, dwelling on "supply management". However, imperatives of the inflationary situation are inducing the realisations that the demand side also counts. Whatever anti-monetarists may contend, supply of money is a major factor influencing aggregate demand. The growth of money supply, instead of slowing down with the onset of the slack season, actually speeded up. Of the increase in total monetary assets (M3) which took place in the year ending May 23, one-fifth occurred in the last seven weeks after the slack season had started. It is the Government itself which is the villain of the piece. While credit to the private sector rose by Rs 786 crores during this seven-week period, credit to the government sector rose by a staggering Rs 2,273 crores. The statutory cash reserve ratio is to be increased by one per cent in two instalments, the first instalment having already become operative from the beginning of this month. There is talk of impounding the various increases in the dearness allowance of government employees which have become due on the basis of the consumer price index.

There is also talk of restraining the labour's clamour for higher wages, although how this squares with the reported simultaneous move to once again raise the ceiling on executive incomes from Rs 5,000 to Rs 7,500 defies comprehension. All these measures and moves would be rendered infructuous unless the Government checks its own profligacy. It is bad enough that because of various factors, failure of the bearer bond scheme being one of them, the year would end with a deficit of at least Rs 2,000 crores at the Centre and about Rs 1,000 crores in the states. The situation can only worsen if no attempt is made to curb superfluity, wastage and non-development expenditure. As for the subsidies, whose burden is approaching Rs 2,000 crores, the Planning Commission's repeated exhortations to prune them continue to fall on deaf ears. The only concession made by the Government to economy is the reported move to ask the Economic Administration Reforms Commission what to do! When somebody, that is the Government, is handling somebody else's money, that is the public, economy requires a high degree of altruism and political will, both of which are lacking.

Nonetheless, Milton Friedman is wrong in placing total reliance on curbing money supply growth as a panacea for inflation. Even if the money chasing goods and services increases, prices may not increase if the goods and services themselves increase, which brings us to the question of aggregate supply. It is noteworthy that during the heyday of the Janata regime in 1977-78 and 1978-79 the price rise was very nominal although money supply in the two years increased by 15 per cent and 19 per cent, respectively. Aggregate supply in effect means production. Agricultural production in 1980-81 has been good, the food output touching a peak of 135.5 million tonnes. Food production target for the current year is 138.5 million tonnes. In this context, however, it is important to remember that the improvement has not had a dampening effect on prices because of the policy of interference with the market and fixation of minimum support prices at progressively higher levels. On the industry side the position is dismal. Production in 1980-81 increased by only 3.6 per cent as against a target of 8 per cent. Apart from the problems it has to face because of infrastructural deficiencies—removal of which will have to be a cardinal point in any anti-inflationary programme—Indian industry should be freed from the shackles of excessive controls. No doubt certain concessions have been made, but what has been done does not go far enough. The Finance Minister himself is on record as conceding that there is scope for reducing controls. If the Government is serious, it should adopt the principle that forms the basis of the Dagli Committee report on controls and subsidies: that only such controls are justified which have a direct bearing on the welfare of the weakest sections of the population. Dismantling of the rest of the constrictive apparatus would thus become an integral part of an anti-inflationary policy. Fiscal policy is another aspect that requires careful examination on the supply side. Opinion is widespread, not without justification, that the present taxation structure is not calculated to boost production. But if the controls and taxes are reduced, from where would the election funds come? Therein lies the rub.

Maruti Udyog

The Minister of State of Industry, Dr Charanjit Chanana, had stated that the Government would announce its decision regarding foreign collaboration for Maruti Udyog Limited by the end of June. Now it seems that a decision would take much longer. My inquiries reveal that the power to take a decision is no longer vested in the Industry Ministry but in the management of the public sector company which appears to have been handpicked by the Prime Minister. For instance, the vice-chairman of Maruti Udyog is the same Mr V. Krishnamurthy who some time ago was eased out as Secretary, Heavy Industry. Quite understandably, therefore, Dr Chanana could be expected to be over-cautious in taking any initiative in the matter. Another delaying factor appears to be the insistence of the Government that the foreign collaborator should not only participate up to 40 per cent in the equity but also extend soft loan financial assistance to the company. This would seem to tilt the balance in favour of the state-owned Renault of France. M.A.N. and Volkswagen of West Germany are unlikely to meet the Government's financial expectations. Fiat of Italy has opted out on the ground that a project which stipulates 50 per cent production for export cannot be viable if located in the hinterland. Nissan of Japan appears to have become lukewarm. In his presidential address at the recent annual meeting of the Association of Indian Automobile Manufacturers Mr C. V. Karthik Narayanan did not make even a passing reference to the impact the Maruti project would have on the automobile industry. But in private conversations with some automobile magnates I noticed a certain unease. After all, Maruti will have an annual capacity to produce 100,000 cars, whereas the present combined capacity of all private sector units is 53,000 cars.

EASTERN INDIA TODAY

Iron ore industry in doldrums

By P. C. MAHANTI

IRON ore mining is an important economic activity in eastern India which contributes substantially to the flow of income and volume of employment in the region. If proof of this were needed it is the fact that five of the existing six state steel plants are located in the region because of its extensive iron ore resources in combination with massive coal deposits. Unfortunately mining activity for this important mineral has of late declined with its inevitable depressing effect on the region's economy.

Several factors are responsible for the decline but most of them are manmade. For example the public sector steel plants have rather grudgingly raised the price to Rs 47 per tonne from Rs 42 per tonne they paid a year ago. A technical committee that recently went into the cost structure of the iron ore industry in the eastern region has held that the steel plants should pay at least Rs 56 to Rs 58 per tonne for the mineowners to get something of an economic price. The Minerals and Metals Trading Corporation (MMTC) through its own studies has come to the conclusion that the right remunerative price is Rs 60 per tonne which comes nearer to Rs 66 per tonne that the mineowners want.

In the circumstances payment of only Rs 47 per tonne by the steel plants naturally means a big loss for the iron ore industry and all privately owned mines will be facing the prospect of closure if the current price is not suitably revised in the near future. In fact, the Orissa Mining Corporation has already decided to stop supplying iron ore to the MMTC meant for the steel plants just to force the domestic monopoly buyer to reopen the price issue. The steel plants of course have their own captive iron ore mines but they still buy roughly one million tonnes from outside sources through the Minerals and Metals Trading Corporation. This is a critical quantity without which their production will be affected and the steel plants are bound to feel the pressure of demand for a price revision when public sector producers are threatening to suspend supplies.

The second upsetting factor is a big drop in the quantity lifted for export. The MMTC last year purchased only 1.31 million tonnes of iron ore for the export purposes as against three million tonnes a year ago. The current rate of lifting is at the still lower annual rate of just one million tonnes. Moreover, the order is distributed so unevenly that for some mines it is a meagre 100 tonnes per month. Rather than keep the mines open to execute orders for such paltry quantities several mineowners have reportedly closed down operations already. Not many private mineowners are in the position of the Orissa Mineral Development Company, which belongs to the BIRD Group now taken over by the Government, which can afford to curtail iron ore mining according to the exigencies of the situation and to sell iron ore at Rs 47 per tonne and still be in business. An interesting point worth noting here is that according to some private mineowners the average cost per tonne of iron ore mined from captive sources of the public sector steel plants works out to Rs 90 per tonne.

The industry has been pleading that the MMTC should ask for subsidies from the Government if its own realisations are unremunerative rather than squeeze the mineowners who have little capacity to suffer further losses. Moreover state governments have of late enhanced various statutory levies which are not covered by the price that the MMTC pays to them. The recession in the world steel industry may be largely responsible for the MMTC's lower exports from this region but there can be no justification for denying a fair price to the industry when the lower demand for the ore is no way its fault.

The fall in overseas demand apart, there are distinct infrastructural bottlenecks which are affecting exports. Paradeep port has been handling only five thousand tonnes of iron ore per day as against its rated capacity of 24,000 tonnes per day. The port could be developed to accommodate even 100,000 dwt vessels to load 25,000 to 30,000 tonnes of ore per day. It is for the authorities to move expeditiously both in the interest of the iron ore industry, the MMTC and the port itself. The Banspani Daitari railway line that could bring down transport cost to the port from the iron ore belt of the region by half is still to be completed. None of this is a fault of the industry which deserves to be kept alive through the payment of at least a fair price.

British Airways

If the report that British Airways which has been serving eastern India *via* Calcutta airport for the past fifty years is planning to fold up its operation in phases is correct, then the economic environment in the region is really deteriorating fast. All major international airlines have already withdrawn from Calcutta leaving only British Airways in the field, apart of course from India's own Air-India which too has curtailed service by dropping its direct Calcutta-New York flight already. As for British Airways it too has reduced services through Calcutta from six to four a week and has withdrawn its wide bodied 747 aircraft replacing them by smaller Tristar 500s. It is reportedly planning to reduce the staff as well. This may well be the result of the strains like the enormously increased operational costs which the British Airways has been having to contend with. It really cannot go on operating on routes which are becoming commercially less and less viable due to falling traffic and obviously Calcutta airport is attracting less and less international traffic these days which, in turn, is the result of economic stagnation of public investment.

The fall in the consumption of low density polyethylene in the eastern region is causing serious worry to the Indian Petrochemicals Corporation which is about to conduct a market survey to discover ways of stepping up sales. The corporation estimates that the normal demand for low density polyethylene in the region should be at least 11,000 tonnes but the current consumption has come down by more than 30 per cent due to political uncertainly, power shortage and other constraints. With the constraints removed offtake can be raised by six to eight per cent. The user industries, however, say, that IPCL prices the product too high, much higher than the international prices. If the price can be reduced not only would domestic demand pick up but there would be a readymade export market on the doorstep — in Bangladesh.

Doubly Deadly

Shelltox®

2-in-1 Household Insecticide

knocks down mosquitoes dead, and kills cockroaches, bed-bugs, ants.

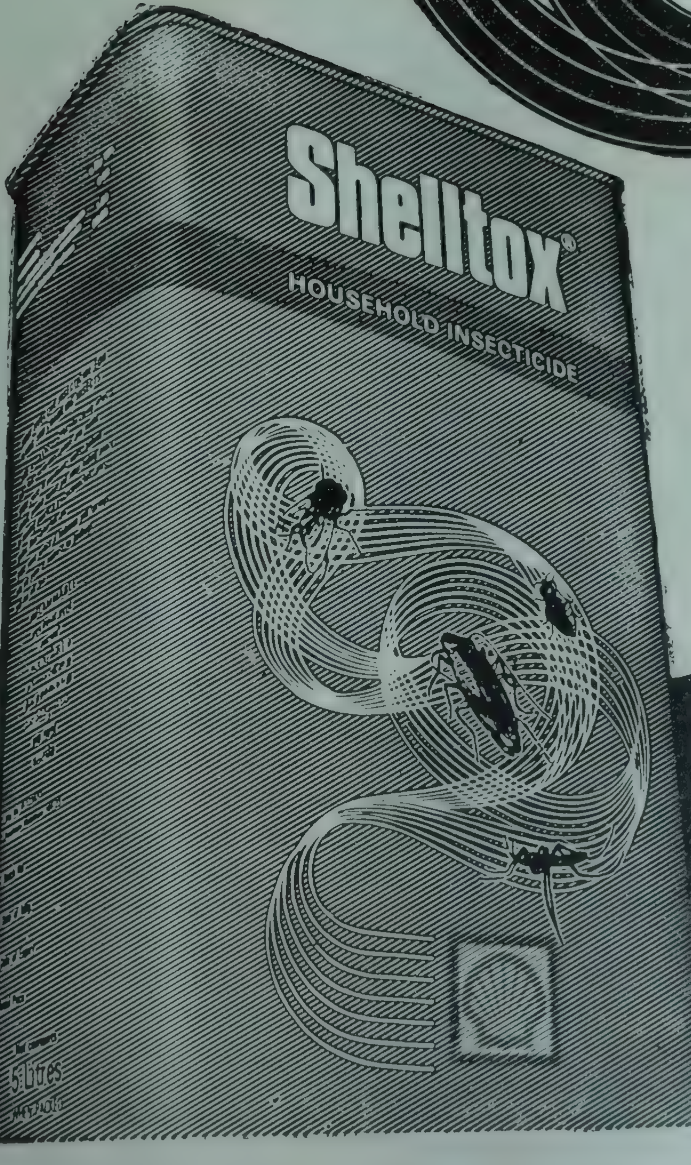
Shelltox—the most powerful 2-in-1 insecticide

Shelltox contains two powerful insecticides—one has a quick, knock-down-dead effect on flying mosquitoes and insects. The other has a longer-lasting, persistent effect that kills cockroaches, ants, fleas, bed-bugs, etc.

Shelltox comes ready-for-use

Shelltox is safer since you do not have to mix it before spraying. Just pour Shelltox into your sprayer. Close all doors and windows and start spraying. First into space, then behind furniture, curtains, beds—wherever cockroaches and insects hide in the house. Then leave the room and keep it closed for 15 to 20 minutes.

Shelltox is available in ½ litre, 1 litre and 5 litre tins from leading stores and chemists.



Shelltox®

the deadly insect killer

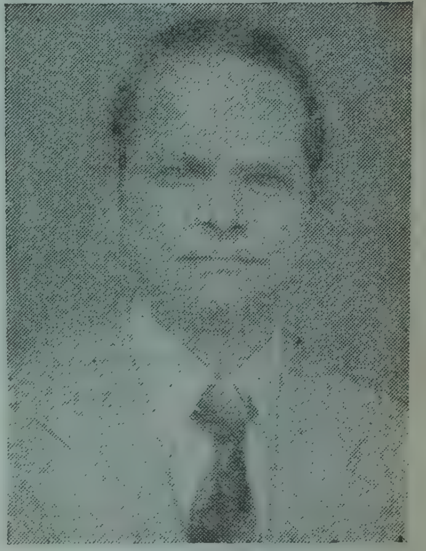
PESTICIDES INDUSTRY— TODAY & TOMORROW

—A FEATURE

Chemical crop protection in Indian agriculture

By A. L. MOOKERJEE



Dr A. L. Mookerjee

ONE way to increase the supply of food is to prevent waste. The "War on Waste" according to the Food & Agricultural Organisation (FAO) could become the most important factor of all, in the battle against malnutrition. The problem is becoming progressively more acute with annual losses from the available land area through soil erosion, industrial development and urbanisation.

In India, the unabated population growth continues to exert increasing pressures on land for more food and fibre despite recent commendable achievements in the agricultural front. The National Commission on Agriculture forecasts a population of 724.91 million in 1985 from the present 680 million level, which will rise to 935.35 million in 2000 A.D. In this context, the foodgrain production of 135 million tonnes in 1980 is a good achievement and the Ministry of Agriculture, Government of India, has fixed a target of 154 million tonnes for 1985. The stupendous task to feed the multitude, however, rests only on 141 million hectares of land (net area sown) out of the total geographical area of 328.8 million hectares in the country. To meet this challenge, the only alternative lies in increasing the productivity from the available land source.

The intensity of cropping is largely dependent to areas with facilities of irrigation. The present irrigated area of 52.2 million hectares will be stepped up to 69.2 million hectares by 1983 out of the total assessed potential of 113.1 million hectares. Besides water, the important inputs that contribute to higher yields are seed, fertiliser and pesticide.

In the seed front, introduction of high yielding varieties in the mid sixties had far reaching effects in achieving the goals of higher productivity. Concurrently, the use of fertilisers (nitrogen, phosphorus and potassium) also increased substantially in the seventies (from 23 lakh tonnes in 1970 to 53 lakh tonnes in 1980). Efforts are underway to raise fertiliser (NPK) consumption to 67 lakh tonnes in 1981 and 75 lakh tonnes by 1983. Greater use of fertilisers and improved seeds or a change in the crop sequence entails a change in the crop environment (agro-climatic change) that accelerates pestilence to formidable intensities inflicting serious crop losses. The recent outbreaks of brown plant hopper and gall midge in rice, canary grass in wheat, stalk borer in sugarcane, blast and blight diseases in rice are but few of the endless examples confronting the present day crop protection experts. Breeding varieties resistant to pests or diseases is still a breeder's dream, neither are they in sight of acheiving it. Nor does the concept of biological control provide a forseeable alternative. The onus to save whatever is produced is, therefore, mainly on the rapid extension and intensification of chemical crop protection programmes in the country.

The waste that occurs in the field and in storage is colossal. The average food grain losses in India due to pests is more than 20 per cent of the total production and the consequent annual economic losses amount to over Rs 5.000 crores. Efficient crop protection practices can considerably obviate this serious loss. The value of crop protection has been successfully illustrated by work in India which showed that insect control in rice alone increased yield by 18 per cent, control of fungi by 14 per cent with the cost benefit ratio of 1:4 and 1:3 respectively. This highlights the importance of pest control in agriculture for rapid improvements in the productivity of our agriculture.

Progress of plant protection in India

With a very modest beginning in the early fifties, plant protection activity had made rapid strides in India in the recent years. The rate of consumption of chemical pesticides in agriculture in the past two decades indicates a phenomenal growth from 460 tonnes in 1954 to 40,534 tonnes of technical grade pesticides in 1980.

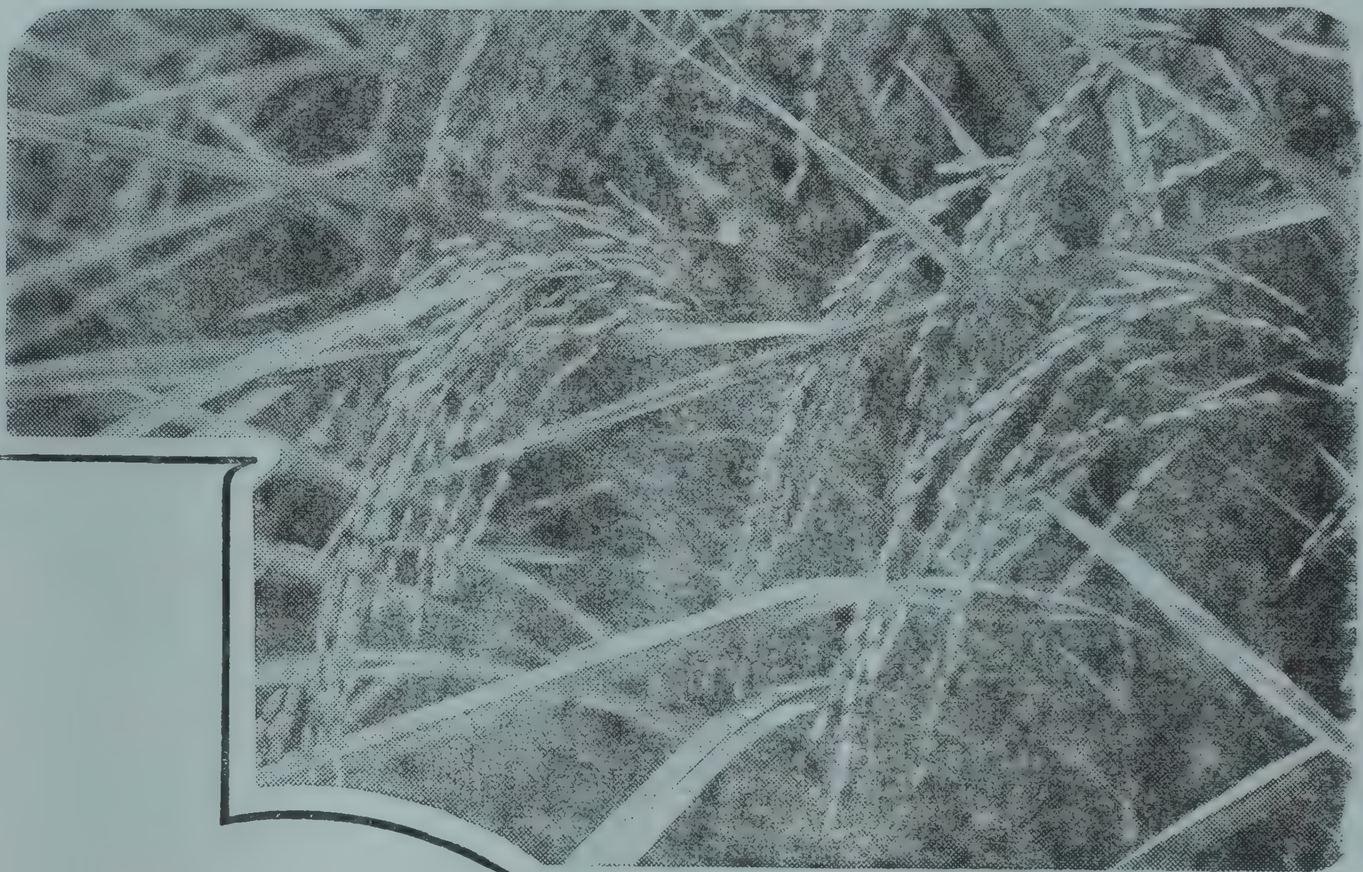
The available figures indicate that a breakthrough in pesticide consumption in agriculture was observed in the seventies when the annual consumption increased by about 30,000 tonnes in 10 years time. The public health pesticides use also increased during this period and the average present level is around 18,000 tonnes of technical grade insecticides annually.

The total area treated by pesticides also increased to 63.3 million hectares in 1980. The trend, though apparently seems encouraging in terms of coverage and consumption, fell short of the expectations to cover 100 million hectares quickly by chemical crop protection measures by the end of the 5th Five Year Plan. The estimated requirement of pesticides to cover 100 million hectares is about 80,000 tonnes. Large coverage undoubtedly increases consciousness and realisation of the value of crop protection chemicals for higher yields, the use levels, per unit area, however, will be still low when compared to the requirements needed for satisfactory returns.

Continued on page 11

Dr Mookerjee is technical manager, Cyanamid India Limited, Bombay.

Insecticide producers . . .
Capitalise on RCF's Methylamines



India's fast-growing insecticide requirement warrants quick action. It is an opportunity to capitalise on the easily-available RCF's Methylamines made to international specifications.

Like Carbaryl, Dimethoate, Carbofuran and Monocrotophos, many more better, safer and less toxic insecticides—all based on Methylamines—are on the way. And the indigenisation of technology would mean a further shift towards Methylamines-based insecticides. Is it not an inviting opportunity?

Not only for insecticides but also for fungicides, weedicides and plant growth regulants, you can rely on RCF's Methylamines-mono, di and tri.

RCF-dedicated to the growth of India's agriculture and industry

Association of Basic Manufacturers of Pesticides

By AN INDUSTRIAL CORRESPONDENT

AGRICULTURE is the backbone of the Indian economy. Five hundred million people, out of a population of 650 million depend on agriculture for their livelihood. Agriculture accounts for about half of the country's national income.

Out of a geographic area of 329 million hectares, 173 million hectares (more than 50 per cent) are under cultivation. The primacy of agriculture for the Indian economy and rural development is reflected in the Government's programme in this sector. The Sixth Plan (1978-83) envisages an outlay of Rs 8,600 crores for agriculture and allied sectors; and Rs 9,650 crores for irrigation and flood control. The present irrigated area of 52.2 million hectares will be increased to 69.2 million hectares by 1983 out of a total assessed potential of 113.1 million hectares.

Multiple cropping with high yielding varieties: cultivation of wheat, rice and cotton in non-traditional areas as well as in the command areas of irrigation projects and introduction of additional crops in the rabi season are some of the cultivation strategies to boost agricultural production in the country and bring prosperity to the rural areas. Inevitably and essentially, therefore, the main thrust to the Indian economy and to rural development must come from agriculture.

Importance of pesticides in agriculture and national health

Pesticides have been recognised as one of the essential inputs for modern agriculture. India loses every year up to 20 per cent of its foodgrains, valued at over Rs 5,000 crores, due to damage by pests. Though the major portion of the produce is lost in the fields, a substantial quantity of foodgrains in storage is devoured by pests. Effective and safe pesticides are needed in sufficient quantities to minimise these losses. The consumption of pesticides in India has grown from 3.2 gm/ha in 1954-55 to 435 gm/ha in 1975-76; but it is still much lower than in developed countries: Japan 10,790 gm/ha; USA 1,490 gm/ha and Europe 1,870 gm/ha. The requirements of pesticides for agriculture have been projected at 64,290 tonnes in terms of technical grade materials for 1983-84.

Pesticides play an important role also in the national health programmes by providing effective control of vectors through which a number of dreaded diseases like malaria, filaria, cholera, kala-azar are communicated. The requirements of the National Malaria Eradication Programme and other public health usage for the year 1983-84 have been projected at 48,000 tonnes of pesticides in terms of technical material. Pesticides are also widely used in households for the control of insects like mosquitoes, cockroaches, silver fish, domestic flies, bed bugs, etc. They also help keep the domestic pets free from ectoparasites.

The total consumption of technical grade pesticides during 1978-79 is estimated at approximately 60,850 tonnes of which 49,850 tonnes were met from domestic production and 11,000 tonnes from imports. The total market for pesticides is estimated at Rs 175 crores. By 1983-84 the total demand for pesticides in terms of technical materials is expected to be around 112,290 tonnes.

In India, the basic manufacture of technical grade materials commenced in 1952, thanks to the Government's far-sighted policy in this direction. Today, there are 25 units in the country manufacturing basic pesticides with an installed capacity of 73,750 tonnes per annum. By setting up these units, the basic manufacturers made available to the country the fruits of international research in the development of new pesticides as well as modern technology for their production, formulation and quality control. Basic manufacturers also undertook considerable research work in developing process technology to utilise indigenous raw materials and intermediates that did not always conform to the standards specified by the manufacturers of basic pesticides in foreign countries. They also played a major role in developing ground and aerial spraying techniques as well as appropriate application equipment suitable to field conditions prevailing in this country.

Presently, the products of basic manufacturers conform to international standards in regard to quality, efficacy and safety. Farmers in India have the benefits of many modern pesticides of world standard—insecticides, herbicides, fungicides, nematocides, acaricides—and the country, a modern industrial base to meet the increasing demand for the present range of pesticides and for the development of new products.

The wide choice of pesticides made available by basic manufacturers have complemented the other agricultural inputs like hybrid seeds, fertilisers, water and soil management, irrigation, thereby contributing to the green revolution as well as in minimising the incidence of communicable diseases.

The green revolution and the national self-sufficiency in foodgrains are testimony to the indispensability of pesticides in the agricultural package of practices. India is among the few countries in the world manufacturing basic pesticides. Twenty-five basic manufacturing units today produce about 50,000 tonnes of 45 difference types of technical grade material and their formulations.

Basic manufacture is highly capital-intensive. It involves substantial investments in research, sophisticated technology for production and quality control, effluent treatment, toxicologial studies, field trials, and on control of environmental pollution. Since manufacture of pesticides is highly corrosive to the plant and machinery, heavy recurring expenditure is incurred on maintenance and depreciation. The working group on pesticides industry, set up by the Ministry of Petroleum, Chemicals & Fertilisers, Government of India, has estimated the requirement of additional investment in the pesticides industry by 1983/84 at Rs 58.75 crores.

In addition to being expensive, basic manufacture of pesticides is a high risk industry. Risks include product obsolescence arising from the discovery of new pesticides, as well as resistance developed by pests, the vagaries of weather and the uncertainties associated with the type and degree of pest infestation. Manufacturers of basic pesticides provide the foundation for the development of the pesticides industry along scientific lines — from research to ultimate consumption.

Research: Research is leading to the discovery of a commercially viable new pesticide goes through several steps, starting from the chemical synthesis of a new activity molecule to intensive primary and extensive secondary screening for biological activity, toxicity studies and to process and formulation development. Such research is extremely expensive and time-consuming. The current estimate of expenditure on research to discover a commercially viable new pesticide is approximately Rs 12 crores.

Technology: Basic manufacturers have access to the

latest production technology - indigenous and international. It is this technology, developed after years of expensive research all over the world, that has made possible the current (1978-79) level of production of 49,847 tonnes of technical grade material, which is estimated to increase to a level of 112,290 tonnes by 1983-84. Forty-five items of technical grade pesticides are now made in the country. Sixty-eight others have been registered by the Central Insecticides Board.

Quality control : The invisible but an extremely important ingredient in a product is its quality. Quality control is necessary at every stage of manufacture — from raw materials to intermediates and finally the basic pesticides and its formulations. Quality control even of the packaging material is essential to ensure product stability in the varied agro-climatic conditions prevailing in the country. For ensuring highest standards of quality, sophisticated and highly expensive equipment is necessary. Basic manufacturers have the wherewithal as well as the personnel to undertake the task, contributing thereby not only to high standards but also to consumer consciousness of quality.

Extension — farmer education : Before a basic manufacturer introduces a pesticide to a farmer, his field staff study the farmer's methods of cultivation. Besides advising on methods of plant protection, the field staff explain the Government's agricultural package of practices in relation to the varieties to be sown, soil improvement, water management, fertiliser application, etc. In addition, a farmer has to be taught when and how to use a pesticide. The field staff educate the farmers in identification of pests, determination of the level of incidence, selection of a suitable pesticide and the right equipment, the right dosage, the right method of application and the right precautions. The field staff therefore undertake significant extension work thereby supplementing the efforts of the extension staff of the States' Agriculture Department.

A Lab-to-Land communication network has been established by basic manufacturers through the media of demonstrations, field days, village fairs and farmers group discussions when film and audio-visual aids are employed to teach improved methods of cultivation. The field staff employed by basic manufacturers are graduates in agricultural sciences and are given intensive training in modern agricultural practices. At present they number around 600.

Distribution : Pesticides have to reach farmers in remote villages. Basic manufacturers have long experience in marketing pesticides and have set up a country-wide network of distribution points estimated at 35,000 wholesale and retail outlets.

Special responsibility

Basic manufacturers of pesticides, by virtue of their scientific resources, technological capability and their financial commitments are vested with a special responsibility within the overall pesticides industry.

This responsibility has a direction and dimension of its own. The complexity and magnitude of the tasks call for a select, professionally managed and appropriately qualified administrative organisation that can devote its time and attention exclusively to the management of these responsibilities.

These tasks, geared to the promotion of agriculture and national health in the country, encompass :

(i) Realistic estimation of demand for individual pesticides to provide a rational basis for planning the growth of the industry and of imports of compounds not locally manufactured. This exercise will necessitate close monitoring of cropping patterns and pest problems. (ii) Compliance with the Insecticides Act and Rules. (iii) Maintenance of high quality standards. (iv) Monitoring the availability of pesticides at reasonable prices. (v) Ensuring widespread distribution of pesticides so that they are available within easy reach of the farmer. (vi) Intensification of farmer education in the proper usage of pesticides and rendering associated extension services. (vii) Undertaking scientific field trials to determine the bioefficacy and suitability of different pesticides under Indian agro-climatic conditions. (viii) Generation of texicological data. (ix) Minimising hazards related to environmental pollution. (x) Introduction in India of pesticides discovered through latest domestic and international research. (xi) Providing information to the Government about the pesticides industry and submitting proposals to the Government to enable it to formulate policies which are conducive to the long-term growth of the industry.

These diverse tasks can best be achieved by basic manufacturers of pesticides working collectively through an association of their own. In fulfilment of this objective, an Association of Basic Manufacturers of Pesticides has been established.

Services

The Association plans to render the following services :

Government : (a) Collate data, productwise, on sales, consumption, production and imports of pesticides on a regular basis. Efforts will be directed towards building a reservoir of information on Statewise acreages of various crops, agricultural practices, etc. This data will provide a scientific basic for making projections of demand. Appropriate recommendations will be made to the Government authorities concerned, enabling the Government to plan for the required industrial capacities as well as compute and allocate the foreign exchange requirements for imports.

(b) Monitor the availability of pesticides and make suitable recommendations to the Government.

(c) Keep a close watch over the trend of international prices of pesticides and inform the Government of major developments.

(d) Provide a forum for sharing the industry's experiences with the Government and assist the Government in the implementation of its policies.

(e) Maintain a regular and meaningful dialogue with Government on problems facing the pesticides trade and industry and recommend appropriate remedial measures.

(f) Periodically undertake special studies on various aspects of the pesticides trade and industry and advise Government. The Government can then take these facts into account when evolving its policies.

(g) Collaborate with the Government at the Centre as well as in the States, in the effective implementation of Insecticides Act.

Farmers: Quality control of pesticides produced and marketed by basic manufacturers will be strictly maintained. Promote the safe and responsible manufacture of pesticides; Ensure self-discipline among its members, in regard to fixing domestic selling prices of pesticides at a reasonable level; Every effort would be made to regulate the intermediary trades activities in order that the farmer is able to procure his requirements at prices not exceeding those fixed by the basic manufacturers.

Promote the introduction of new pesticides discovered in India as well as in foreign countries—which would benefit Indian agriculture and public health.

Universities and Research Institutions : Make available to Government and research institutions, the benefit of the technical expertise of its members in the fields of production, quality control, application know-how, extension service, bioefficacy trials and toxicology.

Industry : Promote and regulate the development of the pesticides industry and trade on sound and proper lines. Contribute to the growth of the pesticides formulation industry in the small-scale sector, in keeping with Government's objectives and policies.

Role of methylamines in pesticides manufacture

By **K. M. BHIRUD**

RASHTRIYA Chemicals & Fertilizers Ltd produce valuable inputs to agriculture *i.e.* fertilisers such as suphala (15:15:15), suphala (20:20:0) and urea (Ujjwala). Besides this, they also manufacture industrial chemicals such as methanol, dimethyl ether, nitric acid, ammonium bicarbonate, sodium nitrate and sodium nitrite to meet the requirements of various industries in the country.

Dr Bhirud is an entomologist with Rashtriya Chemicals & Fertilizers Ltd, Bombay.

RCF have also realised the need of producing the raw-materials required for the production of pesticides *i.e.* methylamines (mono, di and tri) which are used in the manufacture of carbaryl, dimethoate, ziram & thiram, thereby helping achieve self-sufficiency in agricultural production. In our country more than 70 per cent of our people earn their livelihood from the farms. In times to come, we require more food-grains to be produced for an overgrowing population in addition to the present level. Efforts are being made to achieve more agricultural production by intensive cultivation of the land, use of hybrid and high yielding varieties of crops, fertilisers, irrigation and also by applying modern techniques of agriculture.

An analysis of the plant protection drive shows that the strengthening of pest control measures has not kept pace with the speed of the production drive, resulting in loss to the extent of Rs 5,000 crores. It has been estimated that annual losses by pests and diseases are to the extent of about 40 per cent of the total production. It has been observed that with increased fertiliser consumption and the use of hybrid varieties, the incidence of pest infestation also increased proportionately. So, the use of pesticides is essential for saving our valuable crops from the ravages of pests and diseases.

A plant protection schedule has been prepared in order to serve as a guide to farmers as well as to kitchen gardeners for protecting their crops from pests and diseases and enjoy a bumper harvest with a fair return from their land.

Plant Protection Schedule

Sl. No.	Crop	Disease	Pest	Time of application (weeks after planting).	No. of Spraying/ Dusting	Spraying/ dusting interval in days	Name of pesticide	Quantity/ hectare		Water required/ha.- in lit.

BOWREAH COTTON MILLS COMPANY LIMITED

(Incorporated on 22nd February 1900)

Registered Office : 21, STRAND ROAD, CALCUTTA-700 001

FIXED DEPOSIT SCHEME

Advertisement pursuant to the provisions of the Companies (Acceptance of Deposits) Rules, 1975 as amended upto date.

RATE OF INTEREST

Period	TWO YEARS	THREE YEARS
Rate of Interest	14%	15%

SALIENT FEATURES :

1. Deposits will be accepted with a minimum of Rs. 1,000/- and excess in multiples of Rs. 1,000/- only.
2. Interest will be payable half yearly on 30th June and 31st December and on maturity.
3. Deposits and all payments will be accepted by A/c Payee Cheque only at 21, Strand Road, Calcutta-700 001.
4. The deposits will be subject to the Company's Rules and Regulations as indicated in the application form available at the Company's Registered Office.

The business carried on by the Company and its subsidiaries with the details of branches or units, if any:

The company carries on the business of manufacture and sale of cotton cloth blended fabrics and yarn The Company has its Head Office and Sales Office at 21, Strand Road, Calcutta-700 001 and its works at Bauria in Howrah District. (West Bengal).

The Company has no subsidiary, branch or unit.

Brief Particulars of the management of the Company :

The affairs of the Company are managed by the Board of Directors of the Company.

Names addresses and occupations of the Directors :

Name	address	occupation
1. Sri R. N. Bangur	16, AlipureRoad, Calcutta-700 027	Industrialist
2. Sri S. K. Mullick	12, Allenby Road, Calcutta-700 020	Advocate
3. Sri P. D. Bangur	8, St. George's Gate Road, Calcutta-700 022	Industrialist
4. Sri P. L. Daga	35, Muktaram Babu Street, Calcutta-700 007	Business
5. Sri S. C. Chatterjee	11, Tivoli Court, 1A, Ballygunge Circular Road, Calcutta-700 019.	Company Director

Profits of the Company before and after making provision for tax for the three financial years immediately preceding the date of advertisement and dividends declared by the Company in respect of the said years:

	PROFITS (Rupees in lakhs)		DIVIDEND DECLARED (Rupees in lakhs)			
Year ended 31st December	Before Tax	After Tax	On Ordinary	On Preference Shares		
1978	62.02	29.02	10.67 (17.5%)	0.62 0.55	(10.4%) (9.1%)	'A' Pref. 'B' Pref.
1979	67.73	67.73	10.67 (17.5%)	0.62 0.55	(10.4%) (9.1%)	'A' Pref. 'B' Pref.
1980	61.21	61.21	13.71 (15.0%)*	0.62 0.55	(10.4%) (9.1%)	'A' Pref. 'B' Pref.

Dividend on 9.14,301 Ordinary Shares including 3.04,767 Bonus shares issued and allotted on 27th January, 1981

Summarised financial position of the Company as appearing in the two latest audited balance sheets:

Rupees in lakhs

Liabilities	Figures for the latest financial year for which audited accounts are available (as at 31-12-80)	Figures for the financial year previous to the year referred to in col. 2 (as at 31-12-79)	Assets	Figures for the latest financial year for which audited accounts are available (as at 31-12-80)	Figures for the financial year previous to the year referred to in col. 2 (as at 31-12-79)
1	2	3	4	5	6

			Profit & Loss Account	—	—
Total	1181.23	963.40	Total	1181.23	963.40

Notes: Brief particulars of Contingent Liabilities: (*Rupees in lakhs*)

	As on 31-12-80	As on 31-12-79
i) Claims not acknowledged as debts (including Excise Duty Rs. 15.81 lak hs)	39.85	18.54
ii) Guarantees given by Banks and others on behalf of the Company	52.12	43.91
iii) Bills discounted	66.57	83.53

The Amount which the Company can raise under the Rules as amended :

i) Deposits against unsecured Debentures, Directors' Guarantees and from Shareholders to the extent of 10% of the aggregate of paid-up capital and free reserves	Rs. 28 09 lakhs
ii) Other deposits to the extent of 25% of the aggregate of paid-up Capital and Free reserves	Rs. 70.24 lakhs
	Rs. 98.33 lakhs

The aggregate of deposits actually held on the last day of the immediately preceding financial year Rs. 38.13 lakhs

The Company has no overdue deposits and/or unclaimed deposits as on the date of this advertisement.

It is hereby declared that :

i) the Company has complied with the provisions of the Companies (Acceptance of Deposits) Rules, 1975, as amended ;

ii) compliance with the Rules mentioned above does not imply that repayment of deposits is guaranteed by the Central Government ; and

iii) the deposits accepted by the Company are unsecured and ranking *Pari Passu* with its other unsecured liabilities.

This advertisement is being issued on the authority and in the name of the Board of Directors of the Company and its text has been approved by the Board of Directors at a meeting held on 29th June, 1981 and a copy of this advertisement has been delivered to the Registrar of Companies, West Bengal.

By Order of the Board,
D. C. JAIN
Secretary

Dated, 29th June, 1981.

Chemical crop protection in Indian agriculture

Concluded from page 1

The use patterns of pesticides in India

A study of the market profile reveals interesting information on the use patterns of pesticides in Indian agriculture. The value of pesticides used in 1980 is estimated at Rs 200 crores. Insecticides play a dominant role in the pesticides group with 74 per cent share in the market followed by fungicides with 11 per cent of the market. There is a welcome sign in the recent awareness to use more herbinides. This is mainly due to increased labour costs in manual weeding operations, and for better utilisation of fertilisers and also for efficient weed control provided by modern herbicides. The herbicide market is expected to grow considerably from the present level of eight per cent in the coming years.

In the developed countries, herbicides play a major role with 45 per cent of the market against 35 per cent insecticides, 15 per cent fungicides and 5 per cent other chemicals. Besides, the level of use of pesticides in India per unit crop area is also deplorably low by international standards. The rate of growth in pesticides consumption in India apparently presents a striking rise from 3.2 grams/ha in 1954 to 640 grams/ha in 1980 (230 grams/ha on the basis of total area sown). By contrast, the pesticides consumption in Japan is 10,790 grams, in USA 1,490 grams and in European countries 1,870 grams per hectare. This

Source : Modified from Pesticides Information October—December 1980.

indicates that serious efforts are needed to intensify proper chemical pesticide use not only in areas where pesticides are presently employed but also in the new expansions.

Growth of pesticides industry in India

The growth of pesticides industry in India over the past 30 years is commendable. India, today, is the largest manufacturer of pesticides in the South Asian and African countries with the exception of Japan. The basic manufacture of pesticides commenced in India in 1952 with the setting up of a plant for the manufacture of BHC. This was soon followed by DDT and subsequently by a large number of products to meet the growing demands both in agriculture and in public health areas.

The number of pesticide products manufactured in India at present totals to about 40 comprising varied type of chemicals such as insecticides, acaricides, nematicides, fungicides, rodenticides, weedicides, plant growth regulators and fumigants. The total installed capacity amounts to over 78,000 tonnes within the licensed capacity of about 97,000 tonnes. Additional Letters of Intent have been issued for another 25,000 tonnes.

Insecticides like BHC, DDT and malathion which form a major share of the installed capacity are largely used in public health programmes. There is a growing demand for newer pesticides for their efficiency in pest control and appreciable cost benefit returns. In the field of crop protection, there will always be a need for increasingly sophisticated products to combat the complicated nature of pest incidences confronting the agriculturists in the changing crop environment. The revolutionary trend in this direction is the present discovery of a new group of insecticides, the synthetic pyrethroids which provide dramatic control of pests with minimum quantities of even 10-50 grammes against 1000 grammes per hectare of most of the currently used insecticides.

The number of pesticides used in India is very low in comparison to the USA and other countries. The total number of pesticides products registered is only around 119 and in the number of formulation used in over 150. Out of these limited number of registered products, some suffer from obsolescence and are hardly used.

The crop protection chemicals are widely diversified for specific uses as will be evident from the list of plant protection chemicals used in the developed countries. Today, in the Federal Republic of Germany, the list of plant protection chemicals available contains the names of some 1,600 formulated products, made from some 300 active ingredients. In the United States, there are some 35,000 different labels for products from a large number of manufacturers and formulators, made from 1,400 or more active ingredients.

This indicates that there is a wide scope for development of newer pesticides to meet the requirements of efficient plant protection. It is all the more necessary for a country like India where the pestilence is more acute due to sub-tropical/tropical and humid climate which is conducive to rapid multiplication of pests. In India, there are more than 200 major insect pests, 100 plant diseases and hundreds of weeds and other pests such as rodents, harmful birds and the like which warrants greater crop protection efforts. The future success rests with successful development of new products to keep pace with the new requirements in the changing crop environment.

NFT—A crop production technique

By DINESH BALSAVER

THE Nutrient Film Technique (NFT) is a method of growing crops in a thin film of water containing plant nutrients. This technique was developed by Dr Allen Cooper in the UK., and is used today in several countries for growing vegetables and flowers in glass-houses.

Over the last four years, National Organic Chemical Industries Ltd (NOCIL), has devoted considerable time and effort to modify the technique so that it could be used by our farmers to grow field crops under our conditions of farming. The modifications have been of such a fundamental nature that the term NFT could, indeed, be used in India to mean NOCIL Film Technique. This article describes in brief this technique of crop production, outlines its advantages and attempts to look into the future as far as large scale applications of this technique is concerned.

How does it work?

Essentially, the NOCIL Film Technique refers to water management. It involves "encouraging" plants to send their roots into furrows lined with plastic film, referred to as gullies in this article. These gullies hold water and plant nutrients. The following illustration, which gives a cross section, may help in understanding this point.

The 'U' shaped furrows in the figures are the gullies holding water and nutrients. A capillary matting in the form of a narrow strip of sack cloth (about 2" wide and 4" long) is used for "encouraging" roots towards the gulley. One end of the capillary matting is dipped in the nutrient solution in the gulley. The plant is placed on the capillary matting and held there with a thin layer of soil. A small barrier of plastic film is placed below the capillary matting to prevent water getting into the soil via the capillary matting. The roots follow the wet capillary matting into the gulley. Once in the gulley, the roots are able to draw all the nutrients and water required by the plant for healthy growth, from the gulley. Some of the roots go into the soil as shown in the illustration. These help to anchor the plant.

An NFT system consists of one tank (capacity 4,000 to 6,000 litres of water) and several gullies laid in the soil at right angles to the tank. The tank is made of soil compacted and lined with a plastic film. It is a couple of feet above the level of the gullies so that water can flow by gravity into the gullies. The gullies themselves are small furrows about 2½ inches deep, dug into levelled land and lined with a plastic film. From the source of water (well or river or canal) water is pumped into the tank. Standard fertiliser grades mixed in a balanced form to provide all the nutrients, including micronutrients required by plants, are added to the tank. A small plastic tube is used to siphon water from the tank into the gullies. As plants draw water from the gullies it is replenished from the tank. This, in essence, is how the system works.

Advantages of NFT

The advantages of NFT are as follows :

1. It facilitates efficient use of water and nutrients, two scarce inputs in our country. There is no loss of water due to percolation. In NOCIL's rural development work at Chitrakoot (a drought-prone area in Madhya Pradesh) and Uruli Kanchan (Maharashtra), excellent plant yields have been obtained with one-fourth the quantity of water normally required.

2. All the nutrients added are directly 'available' to plants. In normal agriculture, part of the fertiliser added is either physically leached away from the root zone or gets chemically fixed in the soil and becomes 'unavailable' to the plant roots. There is no such problem in NFT, since the nutrients are all in the gulley and are readily available to the roots.

3. Since plants are able to get as much water and nutrients as they need, they are able to achieve their full genetic potential. It is, therefore, possible to get very high yields. In Chitrakoot, for example, yields of 250 to 300 tonnes per acre of hybrid napier grass (for use as fodder) have been obtained. As against this, the annual yield in soil is about 80 to 100 tonnes per acre.

4. In NFT, soil fertility is immaterial and it is possible to get good yields from poor soils since all the nutrition is provided to plants through the gullies and soil is used merely to anchor the plants.

5. It is possible to add 'systemic' pesticides (i.e., pesticides which are absorbed by plants and translocated throughout the plant 'systems') to the water in the tank thus eliminating the need to spray pesticides. It is also possible to get good results with a fraction of the normal dosage because whatever is added is efficiently absorbed by the plants through the gullies.

Economics of NFT

NOCIL has been concentrating on growing hybrid

Mr Balsaver is marketing manager, National Organic Chemical Industries Ltd, Bombay.

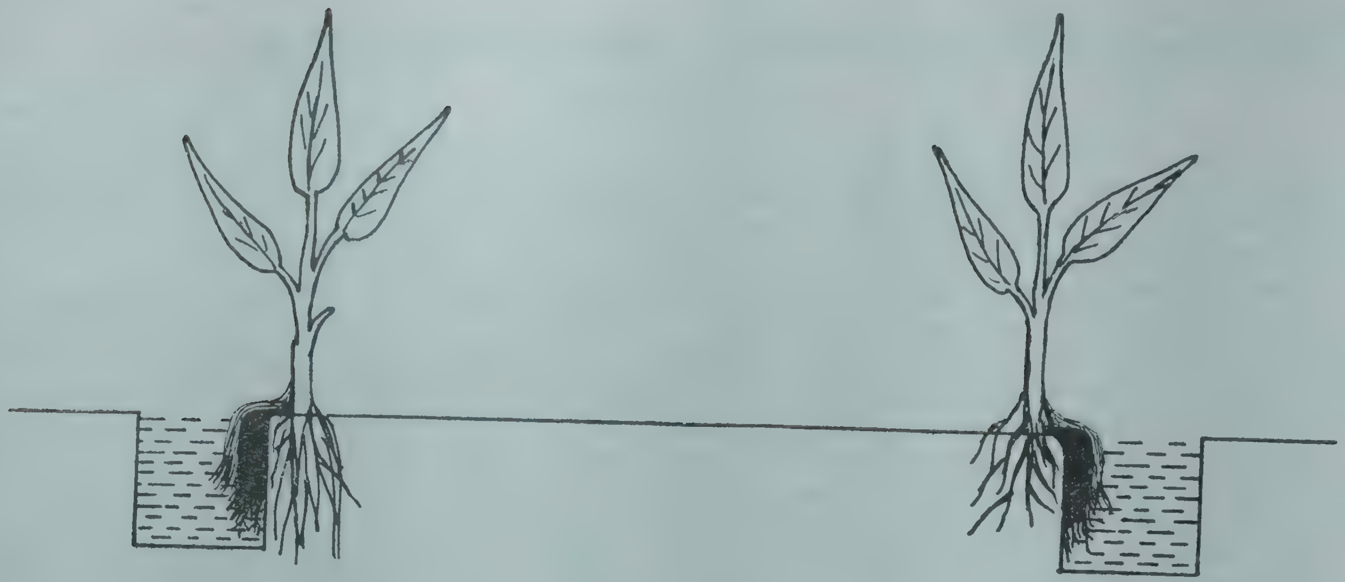

Fig. 1

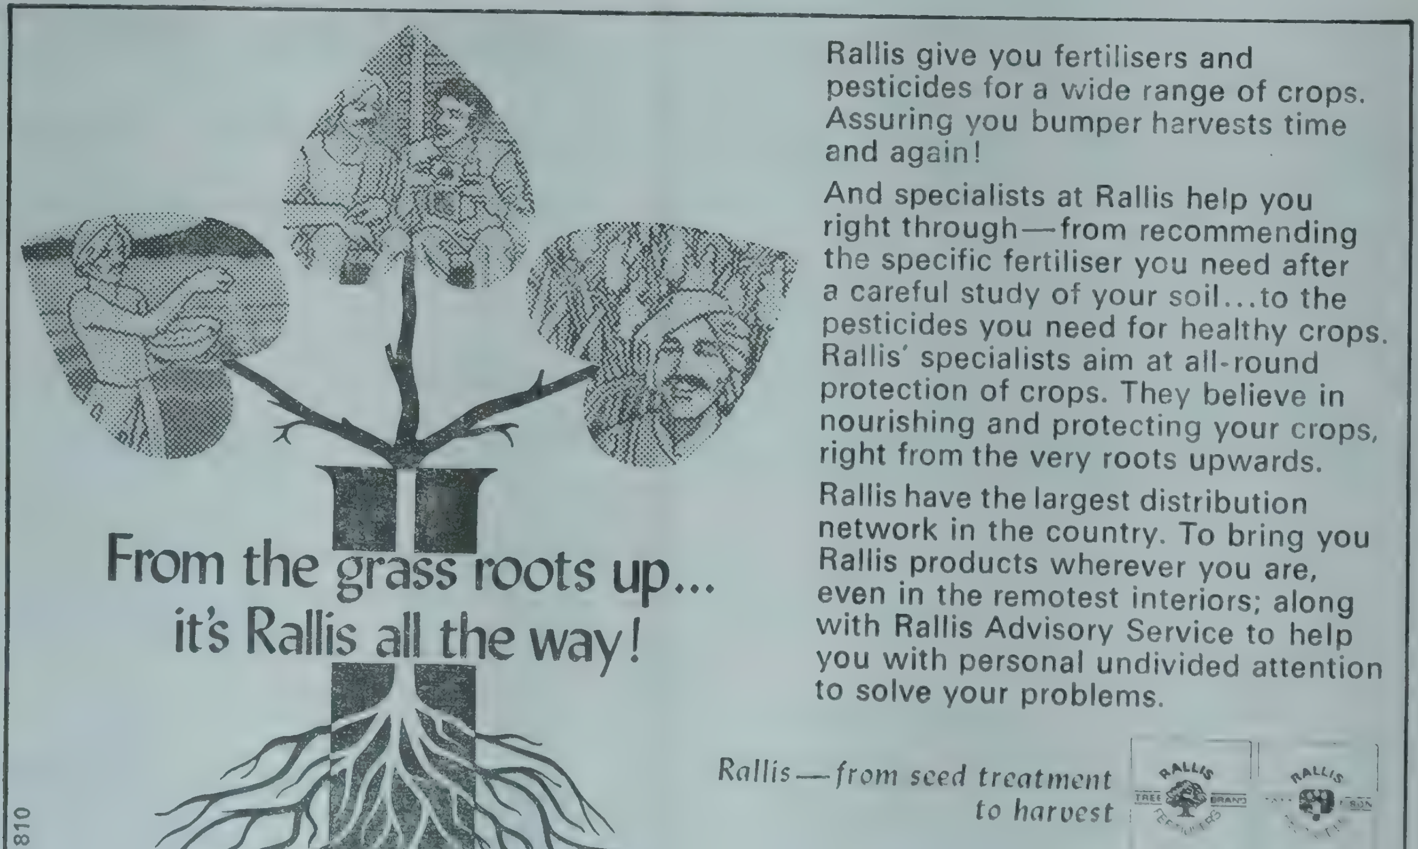
napier grass because of the importance of growing fodder if our cattle wealth is to be improved. The results show that yields of hybrid napier grass grown under NFT is such that investment in plastics and the nutrients are not only recovered in one year but adequate surpluses are built to lift a family above the poverty-line using a 10 guntha installation of NFT.

It is possible to grow almost any crop in this system. Work is in progress to grow different kinds of vegetables, pulses, edible oil plants and even fruit trees by this technique of crop production.

Significance of NFT to agriculture

Due to centuries of cultivation and our tropical climate under which organic matter gets burnt rapidly, our soils are generally poor in organic matter. Such soils do not encourage healthy root growth and we say these soils are not 'responsive' to fertiliser application. NFT offers us an opportunity to overcome this handicap at one stroke and get the best o yields from the most unresponsive soils.

Perhaps the biggest virtu of NFT lies in the possibility of simplifying the technique for adoption by small and marginal farmers. If the infrastructure to supply water plastic film and nutrients i established, a marginal farmer can run an NFT system without much difficulty. NOCIL's experience in Chitrakoot shows that with initia training in laying the gullies and installing a tank, our farmers can readily grasp the essentials of the system and run it without much difficulty. NOCIL is proposing to install this system for 200 families in the Chitrakoot area. These families are, perhaps, the most backward among our farming community. If they show that the system can be successfully operated, the possibilities of transferring this experience throughout India becomes immediately practical.



From the grass roots up...
it's Rallis all the way!
OBM/1810

Rallis give you fertilisers and pesticides for a wide range of crops. Assuring you bumper harvests time and again!

And specialists at Rallis help you right through—from recommending the specific fertiliser you need after a careful study of your soil...to the pesticides you need for healthy crops. Rallis' specialists aim at all-round protection of crops. They believe in nourishing and protecting your crops, right from the very roots upwards.

Rallis have the largest distribution network in the country. To bring you Rallis products wherever you are, even in the remotest interiors; along with Rallis Advisory Service to help you with personal undivided attention to solve your problems.

Rallis—from seed treatment to harvest

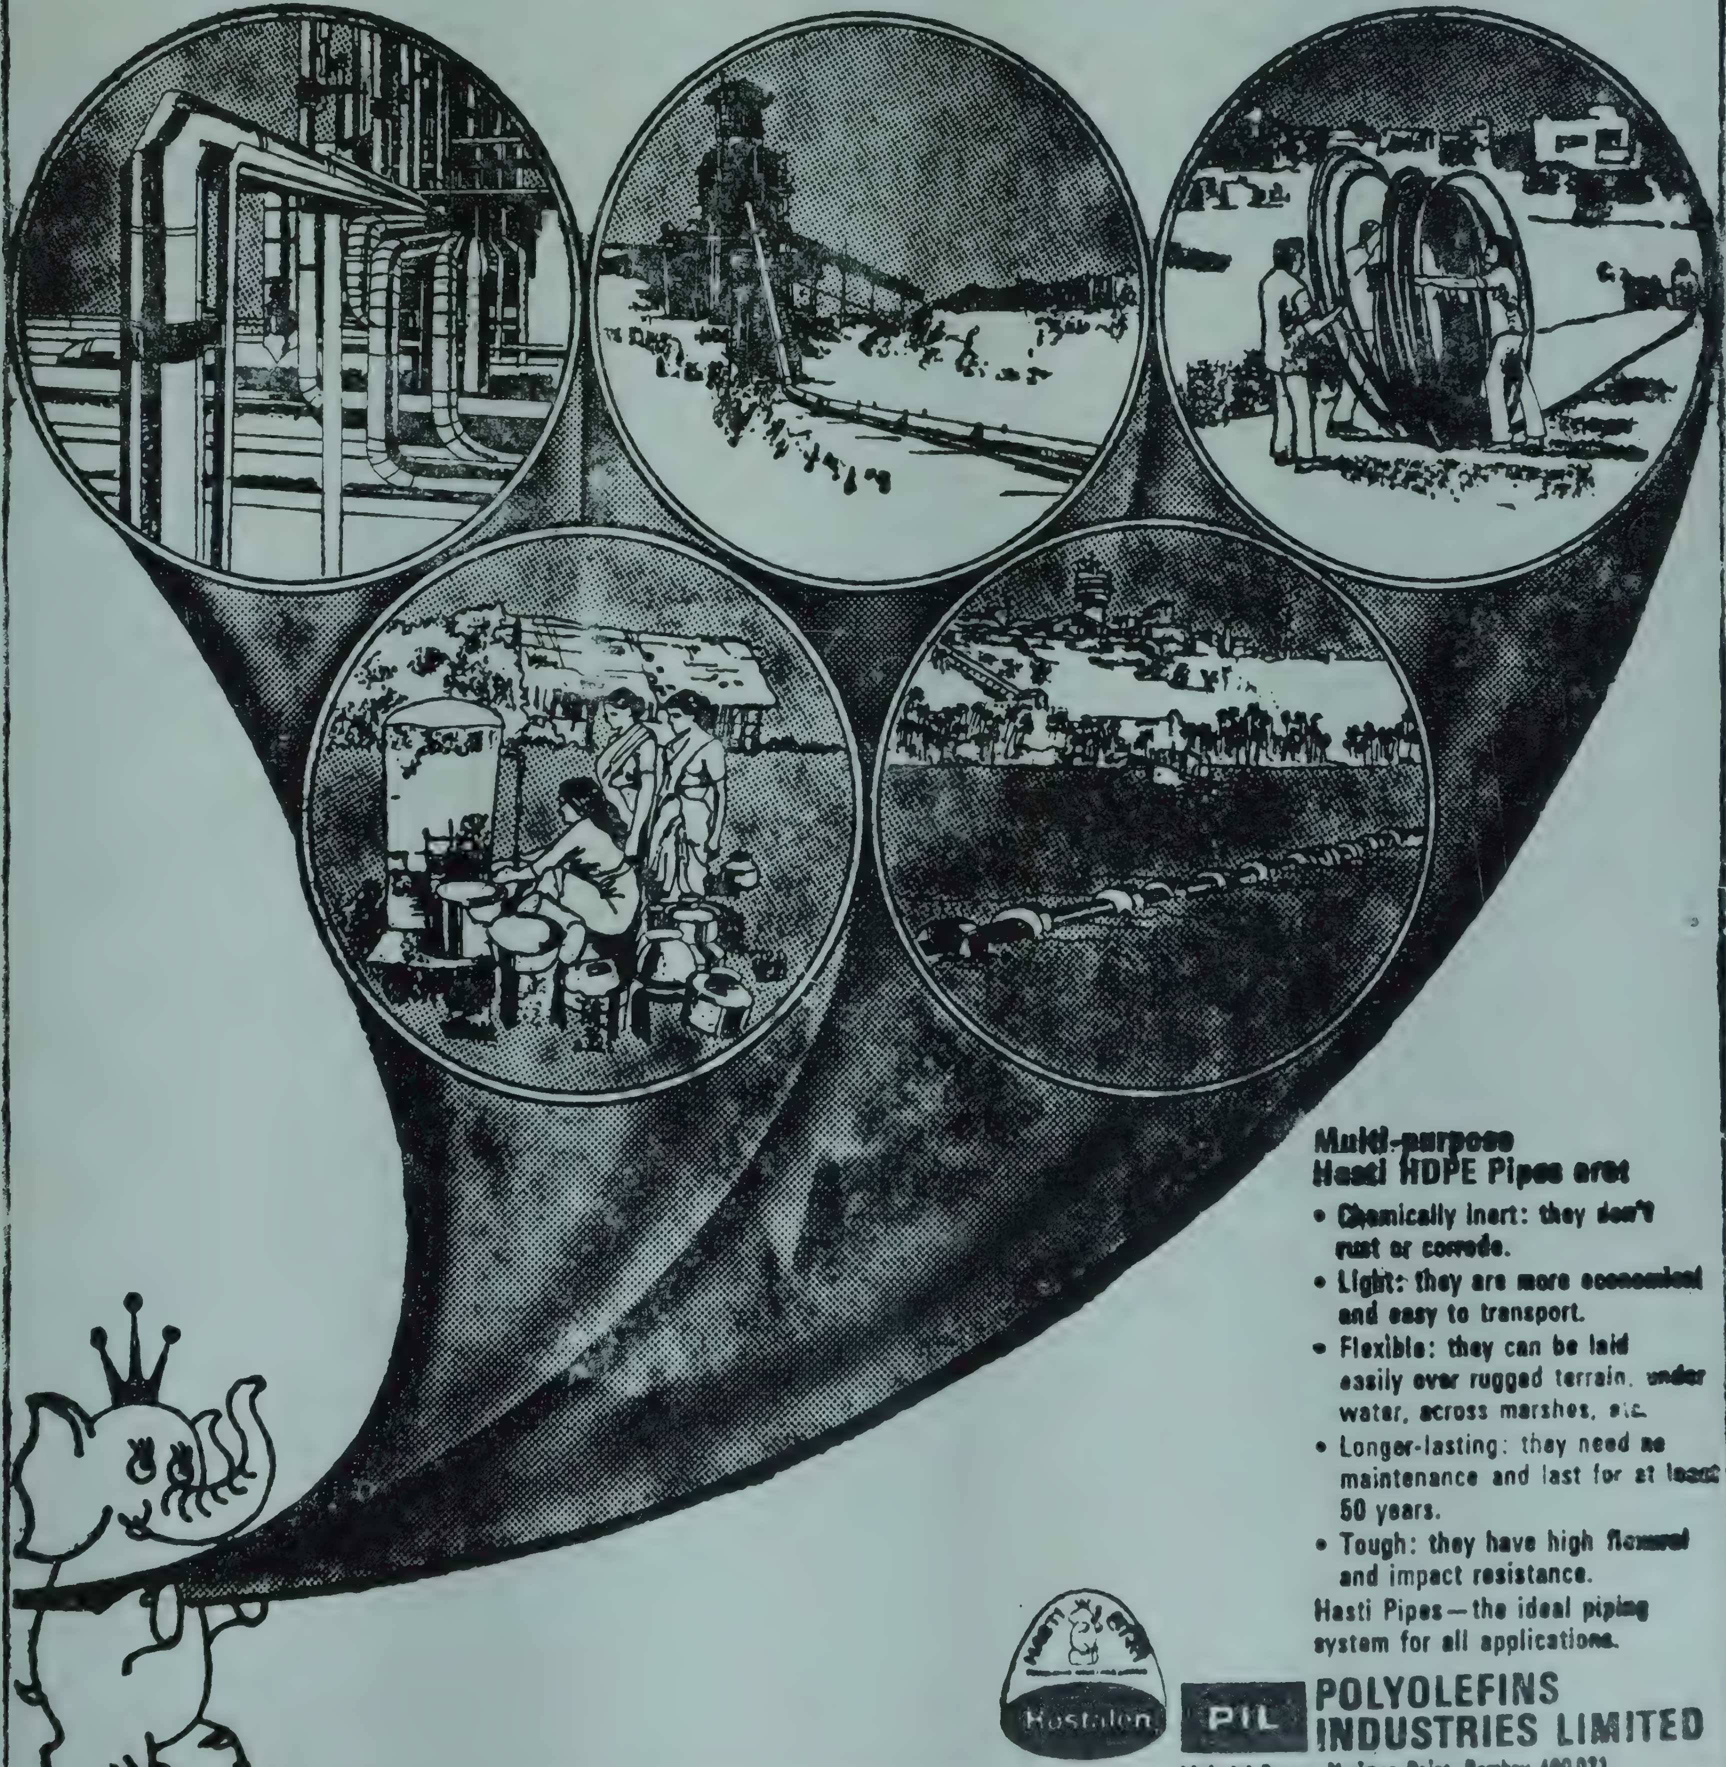
HASTI HDPE PIPES
are ideal for anything that flows.



Multi-purpose
Hasti HDPE Pipes are:

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes — the ideal piping system for all applications.

Special Reports

Wheat imports: To strengthen supply side?

From ARVIND BHANDARI

NEW DELHI

THE Prime Minister, Mrs Indira Gandhi, declared at a press conference here that the governments decisions to import wheat, sugar and edible oils were the beginning of an anti-inflationary exercise.

Earlier reports had mentioned that the quantity of wheat to be imported from the United States might range between 1.5 to 2 million tonnes. The Prime Minister discounted these reports and did not volunteer any information beyond referring to an 'unspecified quantity". Most economic observers have criticised the Government's decision to import wheat. Leaving aside other considerations for the moment, even the arithmetic of foodgrain buffer stocks makes the decision to import wheat one of borderline wisdom, if not totally wrong.

Going by the figure mentioned by Mrs Gandhi herself, foodgrain buffer stocks stood at 13.7 million tonnes on July 1. One effect of greater wheat going into the private channels has been that the offtake from the public distribution system has fallen. It has been 4.6 million tonnes during the first five months of this year as against 6.5 million tonnes in the corresponding period last year. If the rate established in the first five months is any indication, the offtake in the remaining seven months of the current year should not exceed 6 to 6.5 million tonnes. On the other hand, since rice procurement in the wake of the last *kharif* season was 5 million tonnes, it could, in view of helpful behaviour of the monsoon and lessons learnt from the recent procurement imbroglio, be expected to be substantially more than five million tonnes after the present *kharif*. This means that there is no danger of depletion in the country's food buffers below the level of 13.7 million tonnes mentioned by the Prime Minister. And the ideal level of buffer stock for the country is said to be 15 million tonnes.

The upshot is that the knee-jerk reaction of importing foodgrains could have been avoided. Mrs Gandhi herself said in her prepared statement: "I have no doubt that, in terms of availability of foodgrains, our situation is very comfortable."

For a country which has taken pride in having acquired self-sufficiency in foodgrains, imports of wheat cannot but dim its political image on the international plane. In fact, it is also acutely embarrassing for the Congress (I) Government, which explains the puerile attempts of Krishi Bhavan to hide the facts until the Prime Minister herself let the cat out of the bag. Furthermore, the price to be paid for the purchased wheat is reported to be considerably higher than the indigenous price. It is also being questioned whether it is proper for the Government to support the foreign farmers at such a huge cost.

Since the decision to import wheat is being flaunted as an anti-inflatonary move, it is worth considering whether it can stand closer scrutiny. The additional foodgrains that would become available following imports are unlikely to result in any enhancement of the individual quota supplied through the public distribution system. Neither does the Government release foodgrains in the market through open market operations in order to bring down their prices. All that would happen is that the size of the buffer stocks would become a little bigger. Thus the effectiveness of imports in bringing down foodgrains prices would be limited only to the psychological effect these would have on the private trade. Surely the deflationary result of such a psychological effect cannot be more than marginal.

To quote Mrs Gandhi: "When there is availability that is the time to build up substantial stocks so that we do not have to take chances and are not at the mercy of traders and hoarders withdrawing supplies from the market. This decision was taken to avoid any sharp increase in foodgrains prices, and as an instrument of control of the economy. This wheat can be released as and when it is necessary to combat pressure on prices and the machination of traders and hoarders." But from the foregoing argument it is clear that, following imports, the private trade will neither disgorge stocks substantially nor will foodgrain prices come down meaningfully unless the Government uses the additional quantities available to either supply more foodgrains through the ration shops or release foodgrains in the open market.

Another question that comes to the fore from Mrs Gandhi's statement is that if the Government admits there is hoarding of foodgrains, why no action is being taken against the hoarders, whether they be farmers or traders. Are the various preventive detention measures added to the Government's legal armoury mere decorative devices? Is the Government afraid to do its duty because of political reasons?

It is a measure of how awe-stricken the journalists were by Mrs Gandhi that during the press conference she was able to depict foodgrains imports as an act of expediency whereas actually they are a symbol of gross economic mismanagement. It is ironical that foodgrains are being imported at a time when their production has been a record 133 million tonnes. The Government should have realised that the private trade would be able to corner a substantial part of the wheat by offering prices considerably higher than the procurement price. It should, therefore, have arranged to support the procurement drive by banning inter-state movement of wheat or imposing a levy or both. By the time Krishi Bhavan woke up to the serious lag in procurement the horse had bolted. Last-minute efforts in Punjab and Haryana to unofficially ban movement of wheat and also to forcibly extract stocks from farmers with the help of the police proved both hamhanded and late. If anybody is responsible for the bungling, it is the Agriculture Minister and the Chief Ministers of Punjab & Haryana. Anyhow, the result is that food procurement has not been even seven million tonnes as against a target of 9.5 million tonnes. Interestingly, the gap left in the procurement would perhaps be the quantity the Government plans to import.

Regarding edible oils, Mrs Gandhi announced that 5 lakh tonnes are to be imported in the next four or five months. But regarding sugar, she did not, as in the case of wheat, indicate the quantity. Sugar also presents the ironical case of imports being made despite "a comfortable" production of 52 lakh tonnes compared to only 38.6 lakh tonnes last year.

In the case of sugar also it is unclear how the imported quantities are to be used. Would the ration card sugar quota be increased? Would the Government itself enter the market? Or is the intention to merely build a buffer stock and use it, as in the case of wheat, as a psychological instrument against the trader. Since the wheat and sugar imports are probably meant as psychological moves, it is all the more necessary that the quantities to be acquired should be publicised. The Government's unwillingness to disclose the quantities does not, therefore, stand to reason.

Mrs Gandhi sought to make out during the press conference that inflation was being controlled. To substantiate this claim she stated that the annual rate of inflation came down from 21.4 per cent in 1979-80 to 16.4 per cent 1980-81. This decline in the rate of inflation has continued. Up to June 20 this year the annual rate of inflation has come down by over 10 per cent compared to last year. But serious reservations make the Prime Minister's assertion misleading. Firstly, she is talking in terms of "rate of inflation" and it is commonsensical that this rate of increase would decline as the base over which it is calculated rises progressively. Secondly, the Prime Minister should have candidly conceded that the year with which she is comparing the present-day rate of inflation was a drought year. Thirdly, to take about, as she did, India having the lowest prices in the world is to rub an inflation-rocked people the wrong way. Does the Prime Minister not know that India also has the lowest incomes?

Many fear that the petroleum price hike will send fresh inflationary waves through the economy. There are stray reports about intentions to revise upward prices of some strategic materials like cement and steel. The Government has decided to release one instalment of dearness allowance of government employees. Pious intention about curbing non-development expenditure are also being mentioned. These can carry no conviction in the absence of visible action, as in the last budget also the Government made a similar resolve only to forget it even before the ink had dried on the Finance Minister's speech. Also audible is some talk about reducing subsidies. This also carries no conviction because the proposal would require a tremendous amount of political will. Demonetisation of Rs 100 notes was mentioned at one stage and rightly rejected as an absurd proposal. It is noteworthy that there is a realisation that control of inflation requires both supply and demand management.

The Prime Minister, during the press conference, claimed an improvement in industrial production. The increase in industrial production in 1980-81 was only 3.6 per cent as against a target of 8 per cent. It also needs to be realised that the improvement was over a truncated base as the previous year had shown a negative growth. The improvement in the infrastructure should also be somewhat discounted because the comparison is with the earlier drought period. Nonetheless, the improvement is welcome and it is to be hoped that it would be sustained. According to figures given by Mrs Gandhi, the generation of power in the second half of 1980-81 was 13 per cent higher over the corresponding period of the previous year. Coal production exceeded 118 million tonnes last year. Railway freight movement was also augmented, though it remained below the target. During the first quarter of the current financial year power generation increased by 19.2 per cent, coal production by 6.2 per cent, steel production by 20 per cent, cement production by 20 per cent and the railway goods traffic by 14 per cent over the corresponding quarter of the previous year. The production of 29 major industries increased by 19 per cent through April-May 1981 over the same period a year ago. The Prime Minister did not clarify whether these various improvements were in quantum or value. If it is the latter, part of the statistical improvement is ascribable to inflation.

FERTILISERS

Western region leads

BOMBAY

CAPACITY utilisation by the fertiliser factories in the western region, comprising Maharashtra, Gujarat, Madhya Pradesh and Goa, has improved to 85 per cent last year compared to that in the rest of the country, according to Mr R. Kapoor, chairman, Fertiliser Association of India, western region.

Addressing the 21st annual general meeting of the western regional committee of FAI, Mr Kapoor said that in spite of increasing fertiliser capacity in the country by 7 lakh tonnes last year, the industry could not maintain its production tempo owing to power cuts and non-availability of essential raw materials. Production in terms of nitrogen and phosphate, which was 29.87 lakh tonnes during 1979-80, increased only marginally last year. However, factories in western region gave better performance during the year and shared over 27 per

Shortages and surpluses

Urea

Sales of fertilisers affected in Maharashtra due to inadequate availability of urea.

Coal

As many as 81 pairs of trains cancelled by Western Railway due to coal shortage.

Cement

Over 20,000 construction workers became jobless in Pune as building activity came to a standstill there due to acute scarcity of cement.

As I see it

Economics and politics of smaller districts

SEVERAL districts in the country have been partitioned recently to create new administrative districts. In Maharashtra two new districts have been carved out after the 1981 census — Jalna from Aurangabad and Sindhudurg from Ratnagiri. In Uttar Pradesh Kanpur (rural) has been created. The latest is the bifurcation of Twentyfour Parganas in West Bengal into North Twentyfour Parganas (3,897.10 sq kilometres) and South Twentyfour Parganas (5,502.40 sq kilometres). The most spectacular decision in recent times was taken by the Government of Bihar which by one stroke of pen increased the number of districts from 17 to 31 a few years ago. After the 1981 census two more districts have been created to push the total of districts to 33. In the country as a whole the number of districts went up from 356 in March 1, 1971 to 418 in July 1981 (412 on March 1. 1981).

The rise in the number of districts has an immediate and distinct bearing upon the growth of administrative expenditure in the state concerned. For example, the bifurcation of Twentyfour Parganas would involve an additional expenditure of rupees twentyfive crores — mostly in constructing buildings for the offices and residence of the district magistrate, district judge, superintendent of police and other district-level functionaries.

No doubt an unstated motivation behind the so-called "upgradation" of administration is to provide for a larger number of posts with higher emoluments in the State Government. Thus, although West Bengal is today one-third of the size of Bengal in 1947 before partition, it has a very much larger number of officers of the grade of Commissioners than in 1947. The same is the case in Bihar and many other states. Now in virtually all states the departments of the government have come to be headed by Commissioner-level officers instead of secretary-level officers.

Even if the need for increasing the salary of the government officers is conceded it is doubtful if this underhand way of doing it is to be preferred to a straightforward decision of revising the payscales upwards. A consequence of this devious method of enhancing salaries of top government servants has been the relative downgrading of the judiciary in terms of financial rewards. Whereas no IAS officer was expected to draw a salary higher than that of a High Court judge the backdoor manipulations now place the chief secretary to a state government on a higher salary grade than a High Court judge.

The proliferation of high-grade officers would have been still justifiable if it had led to their greater accessibility to the people. It is in the nature of the bureaucracy to imitate the behaviour pattern of the higher level and the culture of inaccessibility practised by the British for their own reasons (lack of knowledge of the language and culture of the people being an important one) continues unabated — nay, is glorified — even after more than three decades of their leaving this country. The fact that the political complexion of the party in power in a State has not made much of a difference in reducing the aloofness and inaccessibility of the bureaucracy only underlines the extraordinary ineffectiveness of politics to have any impact on the imperially-patterned administrative system, in which a foreign element (an IAS or IPS officer belonging to a different linguistic group or State) is expected to keep the people down (soon to be helped by judges to be imposed from other States, if the effort of the Central Government to bring the judges under its administrative control in utter violation of the constitution succeeds). The potentiality of a smaller district to make administration more responsive to the public need that a smaller district contains has thus remained largely unrealised in the smaller districts created earlier and is likely to remain so in the new ones as well.

Subhash Chandra Sarker

cent of the national production of fertilisers.

Mr Kapoor said that the increase in national consumption of fertiliser at 6.5 per cent last year was insignificant compared to 20 to 25 per cent increase during 1976-77 to 1978-79. Rise in prices of fertiliser since 1980 was largely responsible for this, and Mr Kapoor added that inadequate monsoon in some parts of the country was also one of the reasons for small increase in consumption in the country. Consumption was almost static in Maharashtra, while it was slightly down in Gujarat and, though the increase in Madhya Pradesh was 23.3 per cent, compared with the 1978-79 trend, the rise was hardly 2 per cent. The country handled 1.3 crore tonnes of different fertiliser materials last year and the share of the western region was 27 lakh tonnes.

Referring to the production scene next year, Mr Kapoor said that with the commissioning of two urea plants at Bharuch in Gujarat and Turbhe in Maharashtra, urea capacity in the region would go up by 2,800 tonnes daily. The expansion plan at Kandla was complete and the Surat plant expansion would be over in the next three months.

Mr Duleep Singh, chairman and managing director of Rashtriya Chemicals & Fertilisers Ltd, Trombay was unanimously elected chairman of FAI-WRC for 1981-82.

BUSINESS OPINION

MR H. J. R. B. Salnon, Chairman, Warren Tea Ltd: "There are some hard decisions lying ahead for the Indian tea industry and there is need to take very careful stock of the situation and of the options that lie ahead. The general outlook on the supply demand situation in the international context does not lend much hope to a rise in prices sufficient to combat the inevitable increase in costs with which we will be faced. To a certain extent the effect of increases in the unit cost can be offset by some reductions in expenditure and change of product and marketing mix. However, in the ultimate analysis the increased expenditure from year to year needs to be spread over bigger crops, if we have to earn enough for our development plans. The technological means of achieving such increases are within our capability, but the massive capital input in extension, planting and replanting that will be necessary calls for a fair certainty of a growth in demand, which can only be ensured by deliberate steps to promote consumption of tea generically abroad and more particularly at home.

"With regard to capital outlay on extensions and replanting, the recent revision substantially upwards of the replantation subsidy and the development allowance is a welcome acceptance of this fact by the Government of India.

"In connection with the promotion of increased consumption, I think we should look primarily at the situation at home, where I feel the scope is immense. Apart from being the largest producer of tea in the world, India is also the greatest consumer in volume terms, but the annual per capita figure, at less than half a kilogram per head, is one of the lowest—two-thirds of Pakistan's. When one thinks of India's population, running at over 680 million at the moment, and estimated by some to reach 1,000 million by the turn of the century, a per capita annual increase in consumption of a few ounces per head would reverse completely the current supply consumption imbalance."

MR A. A. Mehta, chairman and managing director, Indian Airlines, addressing 30th annual convention of the Travel Agents Association of India in Colombo, said that while the predominant requirement was an incentive at the destinations, a tourist should also find some human satisfaction, adding "discounted fares can hardly be promotional."

He reminded the travel agents that it would be essential to look for the citizens or residents of this region who could be made to travel to another country purely for a holiday. In this process, we should not confuse ourselves with the tourists coming from other regions with the intention of covering some of the regional sectors as part of their worldwide travel intineraries.

Mr Mehta suggested to the Indian travel agents to formulate a profile of the "South Asian Prospect" who can be persuaded to have a holiday in the neighbouring country and examine "whether the fare discounts would make him something more than a mere prospect, *i.e.*, a tourist." If a sample survey was undertaken among the well-to-do in any of the countries in this region it could be found that the destinations like Europe, UK or USA had topmost billing in the preferences of the potential tourists. Hongkong or Singapore may be running a close second mainly because of their shopping attractions.

The only travel motivations that appear to have scope for development in this region are family relationships and religions, he said. Religious commonality, family ties or old associations could be growth areas for the immediate future. But whether these markets are small. or have been only dormant because of the high cost of travel, is not easy to ascertain without a motivational study.

He assured the travel agents that if the markets are "substantial" but have been curbed only by the high fares and not by visa restrictions or the high hotel rates or other inhibiting factors, he would be happy to consider discounted fares on regional routes in consultation with other operating carriers and Governments.

China's large gold reserves

PEKING

CHINA holds 12.8 million ounces or nearly 400 tonnes of gold reserves, worth about $5.3 billion at present prices. This has been revealed by the Peoples' Bank of China for the first time.

Commentators have noted that the gold reserves of China are slightly more than those of South Africa, the world's largest producer, but only half those of Britain, which stands ninth in the world league of goldholders. China is reportedly the world's fourth or fifth largest gold producer.

The figures have been revealed in response to repeated inquiries made by the International Monetary Fund and the World Bank which China joined a year ago.

China, it is said, has been building up its gold reserves during recent years. The Bank of China is a regular dealer on the international bullion market but, of late, its sales have not been made public.

UTTAR PRADESH

New mineral based projects

LUCKNOW

UNDER its R & D programmes the UP State Mineral Development Corporation has taken up several schemes in collaboration with the State Directorate of Geology for the development of rock phosphate in Lalitpur, tungsten deposits recently found in Almora, and copper-zinc deposits, now under detailed exploration in Pithoragarh district.

Besides these schemes, the Corporation is pursuing the possibility of setting up a project for sponge iron in Lalitpur district based on the availability of low grade iron ore reserves of Girar.

Prospects for development of new dolomite and limestone deposits in Almora and pyrophyllite deposit of Jhansi and Lalitpur districts are also under close examination.

On the basis of the project profiles prepared, a private sector undertaking M/s ARC Cements, is setting up a mini cement plant in Dehra Dun for producing 150 to 200 tonnes of portland cement per day. Another mini cement plant is proposed jointly by the UP Cement Corporation and Garhwal Mandal Vikas Nigam. Both these plants would draw their raw material from the Corporation's Lambidhar limestone mine. Thus, the Corporation envisages bringing up of an additional investment of about Rs 50 crores in Dehra Dun region based on the project profiles prepared by it.

Since its establishment in 1974, the corporation has commenced development of Lambidhar limestone mine in Dehra Dun district, of Bari dolomites, near Obra, in Mirzapur district, of Bhalua limestone mine, near Obra, in Mirzapur district, of Ningha limestone mine, near Obra in Mirzapur district, and of Rajahuan bauxite mine, near Manikpur, in Banda district. It is also establishing a calcium carbide plant with a capacity of 21,000 tonnes per annum through its subsidiary UP State Carbide & Chemicals Ltd. Besides, it has undertaken contractual diamond drilling operations operating for the Pyrites, Phosphates and Chemicals Ltd and the UP State Cement Corporation.

BOOKS & IDEAS

Role of SBI in rural financing

Agricultural Finance in India

By P. D. Sharma

Bharat Book Depot; Bhagalpur; 1981 *Pages* 237; *Price*: Rs 55.

Economic development of an agrarian economy like India essentially depends on the pace of agricultural growth. In agricultural development rural credit has dynamic role to play. The dynamics of agricultural financing has passed through several phases during the planning era. In this book Dr Sharma focusses attention on various aspects of the rural finance, particularly, in view of the activities of the State Bank of India in this regard. Dr Sharma, in specific terms, seeks to evaluate the role of the SBI and its subsidiaries in the field of farm financing.

The book runs into nine chapters. It opens with discussing the role of agriculture in Indian economy and the significance of agricultural credit—with its dual aspects: quantitative and qualitative. Chapter two poses a bird's eyeview on the relative significance of different rural credit institutions and agencies, like government, co-operatives, money lenders, commercial banks, etc. But, there is a lacuna in the treatment. The period covered is only up to 1970. As such, the whole analysis is of not much relevance to the present day conditions. Chapter 3 is devoted to have a look the experience of agricultural credit of some selected countries to draw some lessons for India. Chapter 4 narrates background and functions of the State Bank of India which is commonly found in many text books on Indian economy. In chapter 5, SBI's methods and extent of financing agriculture have been elucidated. Chapter 6 deals with the branch expansion activities of the SBI aimed at resource mobilisation and resource distribution to uplift rural development. But, here too, Dr Sharma has not gone beyond 1970 statistics. Nonetheless, some of his suggestions are still worth considering, for example (i) deposit mobilisation should be linked with credit disbursement to an increasing extent. (ii) avoidance of delays in advancing farm loans, simplification of loan procedures, use of local language in opening and settling account and full appreciation of the borrowers problem, (iii) preparation of districtwise, annual plans for deposit mobilisation.

In Chapter 7 the author makes a survey of problems confronted by banks in financing agriculture in our country. In Chapter 8 a comparative study of farm credit activities of co-operative, commercial banks and SBI is made. This chapter could have been made more illuminative if more recent data were incorporated in the analysis. Last chapter contains concluding observations of the whole study.

It has been held by the author that in the matter of farm credit the performance of the SBI has been relatively more convincing than other nationalised banks and unless the latter do something seriously, a lopsided. bank-credit pattern cannot be avoided. The author's suggestion for issuing a credit-card to each farmer by the appropriate block authorities and attachment to a specific bank is worth trying.

D. M. Mithani

Improving farm productivity

Farm Mechanisation: Extent and Impact—Commerce Pamphlet—160

A. R. Patel

Published by Commerce Publications, Manek Mahal, 90 *Veer Nariman Road, Bombay*-400 020; *Pages* 42; *Price* Rs 5.

The following are the highlights of the pamphlet:

Adequate and timely supply of power from assured and reliable source is inevitable for performing the desired farm operations uniformly and efficiently. With the use of modern machines operated by diesel or electricity, the horse-power-hours' requirement to perform these important operations is reduced considerably.

Mechanisation in the developing countries has been more in the nature of a means for increasing production in a given situation. Mechanisation has been emphasised with the ultimate objective of increasing productivity of land, labour, irrigation and other inputs of production. While the productivity of land is a function of improved—technology of which mechanisation itself is a part, the productivity of labour, irrigation and other inputs can be augmented significantly by mechanisation.

Farm mechanisation in the area of irrigation has indeed increased net sown area, area sown more than once and reduced the culturable waste land in recent past. Mechanisation enhances the value of resources without necessarily effecting a physical addition to them. Most important example in this area would be the on-farm development works under Command Area Development Projects. Other important category of mechanisation is one which comprises all those numerous mechanical means whereby efficiency is imparted to agronomic practices These are in relation to soil, water seed, fertiliser, pesticide etc. Unique example is the seed-cum-fertiliser dril which aims at accurate placement o seed and fertiliser at proper depth an appropriate intervals in a manne unattainable by manual means.

A detailed exercise on the suppl of and demand for power throug different sources *viz.* human labour draught animals, tractors, power tillers engines, motors and power sprayer by the end of 2000 AD has been undertaken by the NCA. In this exercise, the NCA has very aptly considered the potentialities of the biologica source for power and attempted to exploit in a well balanced way takin into account the net sown area to increase from 120 million ha to 150 mi lion ha in 2000 AD. Accordingly, th contributions in terms of hp require to be made by these biologica mechanical and electrical sources ar estimated at 129 million hp.

In a comprehensive case study t assess the impact of farm mechanisation at various levels in different size group of farms undertaken in Nainita district of UP, it has been brought ou that process of mechanisation has increased cropping intensity, productivity per cropped hectare, labour employment (increasing hired labour an reducing family labour), gross as we as net income. However, the review of some of the studies reported b Hans P. Binswanagar (1978) as als those of Theodor Bergmann (197 did not provide conclusive evidence the positive and favourable effects farm-mechanisation in India. Perhap this may be due to built-in limitatio of the study, different methodologi adopted for the studies, lack of analy cal approach etc. It is against th background that the study recently conducted by the National Council of Applied Economic Research (NCAER) assumes significant importance. The findings of this study have also confirmed that process of farm-mechanisation directly and/or indirectly enhances the productivity, employment and net return of investment in agriculture. Thus, in view of exploiting mechanical and electrical sources of power, the most urgent need is to intensify our research and development effort for designing efficient equipment and also provide suitable organisation to meet the requirements of services, training etc within a manageable distance.

R & D in Japan

THE structure of industries in Japan is expected to undergo significant changes in the coming decade. Stimulus to growth is likely to be provided in the future by technological progress in electronics, energy, life and materials related areas. In an article in *Keidanren Review*, published by the Japan Federation of Economic Organisations, the vice-chairman of Keidanren, Mr Isamu Yamashita, suggests that Japan needs to be developed into "technology-oriented nation" as it has already developed into "trade-oriented nation". To achieve this goal concerted efforts must be made at government, private and, academic levels.

Mr Yamashita writes: "Let us see how research expenses (nominal) in the field of natural science have changed during the past two decades. In 1960, the total research expenditures amounted to Y184,400 million, in 1970 Y1,195,300 million, in 1978 Y3,570,000 million, and in 1980 Y4,380,000 million. Thus research spending increased at the average annual rate of 22.9 per cent in nominal terms and 14.8 per cent in real terms in 1967-70. In 1970-75, however, the growth rate dropped, because of the oil crisis, to 17 per cent in current prices and 2.7 per cent in constant prices. In 1975-80, however, the nominal and real rates of increase reached 10.7 per cent and 4.7 per cent, respectively. These are about the same as the real and nominal growth rates of the GNP for the 1975-80 period.

"The total research expenditures for 1978 is the third highest after that in the US (Y 9,960,000 million) and the Soviet Union (Y 6,150,000 million). As a percentage of the GNP (1978) the figure for Japan is 2.15 per cent, compared with 4.57 per cent for the Soviet Union, 2.64 per cent for West Germany, and 2.48 per cent for the United States. In the two recommendations submitted by the Council for Science and Technology, Japan's research spending is to be increased to 2.5 per cent of the GNP in the near future and to 3.0 per cent in the long run.

"As for spending classified by major groups of organisation, private corporations and organisations used 64.2 per cent or Y2,291,000 million of the total in 1978, up 8.6 per cent over the year before. Universities spent 20 per cent or Y712,600 million an increase of 13.2 per cent, and research organisations spent 15.9 per cent of the total, or Y566.300 million, a gain of 14.6 per cent

"Research expenses as a whole increased sharply in the 1960s because of vigorous spending by corporations. In the 1970s, however, corporate spending expanded less rapidly. In 1974-75 the total amount even dropped. In the years beginning 1976, however, spending again followed a rising trend. A stable increase is hoped for in the year ahead.

"A breakdown of 1978 spending is as follows: 16.6 per cent for basic research, 25.1 per cent for applied research, and 58.4 per cent for development research.

"In the field of corporate research primary emphasis is placed on development. Basic research is conducted primarily by universities and research organisations.

"Compared with Japan, the US Government contribution is exceedingly high, while the percentage of spending by industry are also considerably high. This goes to show that the United States has a system of research and development whereby private industry takes the lead with the government supplying development funds. In Japan, the goal is to increase the government share to 40 per cent at the earliest possible date so that private enterprises may participate more actively in the field of basic research.

"One problem the government has in entrusting basic and development research to private organisations is how to handle patents. In other words, the government needs to establish a policy as soon as possible concerning the approval of the use of industrial ownerships such as patents by companies that have undertaken such research programmes. The patent problem should not be allowed to stand in the way of joint efforts by the government, private industry and the academic community to set up an integrated research system."

Company Meeting

The Tata Iron and Steel Company Limited

Chairman's Statement

THE following is the statement of Mr J. R. D. Tata, Chairman of the Tata Iron and Steel Company Limited, for the year 1980-81.

Having, for the past forty-three years, inflicted on you Chairman's Statements and speeches in most of which I bewailed the obstacles to progress and growth placed in the path of the Company by Government policies, or other factors beyond our control, it is a particular pleasure for me to be able to address you this time on a more cheerful and optimistic note.

Long-awaited change

2. This new optimism is warranted not so much by the improvement in the results of the past year's operations as by the significant change in the Government's steel pricing policies which culminated on the 24th of February 1981, when the Government lifted control over the prices of billets and bars, which had been in force uninterruptedly since 1941.

3. For the past thirty-five years or so, we have protested and argued against the unfair and unsound industrial price policies of successive Governments, which compelled the Indian steel industry, one of the most vital to the country's economy, to sell its products year after year at ex-works prices equivalent to half the domestic prices prevailing in other steel producing countries. The industry was thereby denied the financial resources that would have enabled it to keep pace with technological advances made elsewhere through a continuous replacement of obsolete equipment and processes.

4. My pleas for a more rational price policy fell on deaf ears or were met with the extraordinary argument that as the steel industry had, between 1923 and 1939, received subsidies and benefited from protective duties at the expense of the consumer, it was only right that it should repay the consumer by supplying cheap steel to the country. No account was taken of the fact that whereas the total cost to the country of the subsidies paid to TISCO and of the higher prices resulting from the protective duties charged on imports during those sixteen years was only Rs 11 crores, over the succeeding forty years, our Company alone was deprived of legitimate earnings after tax of something of the order of Rs 1,300 crores which, taking into account the depreciating value of the rupee, would amount to about Rs 3,400 crores today. Even if we had paid generous dividends from the extra earnings, Tata Steel's capacity would have been at least twice what it is today, and the Company would be producing annually an additional 2 million tonnes, saving the country some Rs 600 crores a year in precious foreign exchange.

5. While we may deplore the thirty-five years it took for the authorities to face up to the economic realities of the steel industry, which they still decline to do in respect of other industries such as cement, we must congratulate the present Government, and particularly its Minister for Steel, on their courageous decision to decontrol billets, bars and rods. By so doing, they have not only relieved the public sector plants and ours from the unfair compulsion not imposed on other steel producers of having to sell these products at uneconomically low prices, but they have done so at little or no cost to the ultimate consumer, for the benefit of the lower selling prices accrued largely to the trade. As at the same time, presumably, a good part of the profit made by the trade escaped tax upto now, deregulation will also benefit the Treasury and therefore the tax-payer and consumer.

Uniform prices essential

6. The method by which from April 1979 the Government compensated the main producers for increases in costs of controlled categories of steel by payments from the Steel Development Fund (SDF) based on each plant's own cost escalations caused us much concern, for it infringed the principle of price uniformity within the industry which had been accepted without interruption for decades. Such a system is unfair to those who, at considerable expense of money, effort and ingenuity, manage to keep their cost increases to the minimum, while it removes all incentives for further effort in that most desirable direction.

7. We have, therefore, urged the Government, and are continuing to do so, to maintain the principle of uniformity and with that intent to make any scheme of compensation for cost escalations in price-controlled products uniform for all the main producers. Deregulation provides the best and most effective means of rewarding efficiency and penalising inefficiency and should be extended to all categories of steel as soon as possible. In both the public and private sectors of the integrated steel industry, Government have ample means to prevent any profiteering. The acute depression prevailing throughout the world steel industry and the resultant relative low prices at which steel can be imported provides by itself an effective limitation on the prices which the Indian producers can charge.

Steel Development Fund

8. At the date of this report, the situation in regard to the Steel Development Fund is still not clear. As shareholders are aware, the Government had announced on the 9th of February this year, an increase of 20 per cent in the prices of all price-controlled categories of steel to be paid in toto into the Fund. However, subsequent to the decontrol of billets, bars and rods on 24th February, the Government decided in June 1981 that the scheme of contributions to the Fund as per the February announcement would apply only upto 31st March. Notwithstanding unconfirmed press reports, decisions whether the SDF is henceforth to be used exclusively for financing modernisation or also for the payment of compensation for cost increases, and as to the amount of contributions to the Fund and the categories on which they are to be made from April 1, 1981, are still to be announced.

9. I hope that in formulating the final scheme of things, the SDF will be reserved exclusively for financing modernisation and consequential minor expansion, and not for meeting cost escalations. In regard to the latter, so far as decontrolled categories of steel are concerned, the producers should normally look to market forces and their own efficiency and cost competitive-

ness. If the Government were at any time satisfied that imports of steel were taking place at uneconomically low prices amounting to dumping, they should, as in the past, resort temporarily to protective import duties. In the case of those categories of steel which continue to be price controlled in the public interest, the Government should increase such controlled prices from time to time to meet legitimate and unavoidable increases in costs. Such increases should be approved after only summary investigations of costs to avoid the long delays, costly to the producers, which invariably took place in the past.

10. An issue of particular importance to the integrated plants, including ours, concerns the terms on which loans are to be made from the SDF against approved modernisation programmes. We have represented to the Government that, as the accretions to the Fund will come from the amounts collected by the main producers, they should be lent back to them at a concessional rate of interest and not as announced at the rate charged by the financial institutions for commercial loans. As the Company's argument has not been accepted upto now, a further representation has been made urging reconsideration on the additional grounds, amongst others, that the funds to be lent will have cost the Government nothing to raise and that the higher rate of interest will increase the cost of modernisation, by about 15 per cent even after allowing for tax relief.

11. We have also urged that even though it may not be specially laid down in the SDF scheme, the amount loaned to each plant over the years should in practice bear a reasonable relation to the amount it had contributed to the Fund. Finally, we have also asked that the integrated steel producers should be represented on the Committee administering the Fund or, if that is not possible, that at least the views of the main producers should be taken into account in its administration and in the grant of loans.

Continuous investment programme

12. If I have dealt with at such length on the manner in which, and the authority by whom, the SDF is to be operated, it is because, apart from the Rs 100 crores already committed to us to finance a part of our Modernisation Programme, we expect to make substantial further calls on the SDF in the future, for we have no intention to rest on our oars after the completion of the first phase of the major programme of modernisation. This will necessarily be followed by a second phase in a process which must be a continuous one : for at least the rest of the decade. In addition, with our financial position strengthened by the increased profitability of our operations, we intend to undertake such programmes of diversification and development as are justified by our technical and material resources. The continued growth of a company such as ours need not come merely from an expansion of capacity and production of existing products. We shall seek every avenue open to us to make the Company grow in its total annual turnover, to the extent allowed to us by the Government and economic conditions. You may be sure that our intention will be to consider only projects which will give us a significant return, including that obtained from increased efficiency and productivity.

Bonus Shares and Convertible Bonds . . .

13. I was glad to note from press reports and market reaction that the Board's decisions in respect of dividends and the issue of Bonus Shares and Convertible Bonds have met with universal approval and appreciation, for over the years, shareholders have been inclined to accuse me and my colleagues of being excessively cautious in the matter of dividends and Bonus Shares, and thus to be unresponsive to their interests. Those who held such a view were perhaps unmindful of the severe limitations on our freedom to decide in these matters imposed on us by the Government financial institutions, the Companies Act and restrictive guidelines. To the extent that we were free to exercise our judgement, I believe that the decisions we took over the years provided the best possible compromise between the conflicting factors we had to take into account, including our anxiety to be fair to the shareholders while maintaining unimpaired the financial security of the Company.

. . . on generous terms

14. As soon as a favourable change took place in the earnings of the steel industry and in its prospects, there was no hesitation or delay on our part to formulate and announce the generous proposals before you in respect of dividends, Bonus Shares and Convertible Bonds. In fact, because the benefits of the Bonus Shares will accrue to the shareholders only next year when the Company will celebrate its platinum jubilee, and similar action obviously cannot be repeated for two or three years, the Directors went out of their way to make the bonus element in both schemes as large as possible in the existing circumstances. Not only was the Bonus Share issue fixed at a high 2 : 5 ratio, but the Convertible Bonds were specially structured to maximise benefits to the shareholders, particularly to small shareholders. In the light of these decisions, I hope that the myth that your Directors are unsympathetic to the shareholders' interests will once and for all be laid to rest. While I am naturally happy at the spectacular rise which has recently taken place in the value of your investment, I hope that a realistic view is being taken of the Company's long-term prospects of growth and profitability.

A great effort

15. In conclusion, while we may rejoice at the improvement in the Company's fortunes, let us not overlook the great efforts made by the whole organisation in offsetting the severe infrastructural obstacles which the Company continued to face throughout the year. Enormous quantities of coal had again to be brought in by road to Jamshedpur because of the continued failure of the Railways to discharge their obligation to provide adequate rail transport. In regard to power, although supplies from the Government power plants did show some welcome improvement towards the end of the year, our own ageing captive power facilities had this year again to be strained to the utmost in order to keep the steel plant producing at capacity levels. Cruel power cuts were imposed on our steel city where, without a murmur or protest, our 40,000 employees and their families, and hundreds of thousands of other citizens suffered great hardships for as many as seven to ten hours per day, day after day.

16. Our workers gave further proof of their loyalty and devotion to the Company which they, rightly, treat very much as their own, by defeating a deliberate attempt on the part of certain political forces to disrupt operations and bring the plant to a standstill, while, in keeping with the unique spirit which has marked industrial relations at Jamshedpur, communal and labour harmony were maintained at a time when the State suffered widespread unrest and disorder on both these counts.

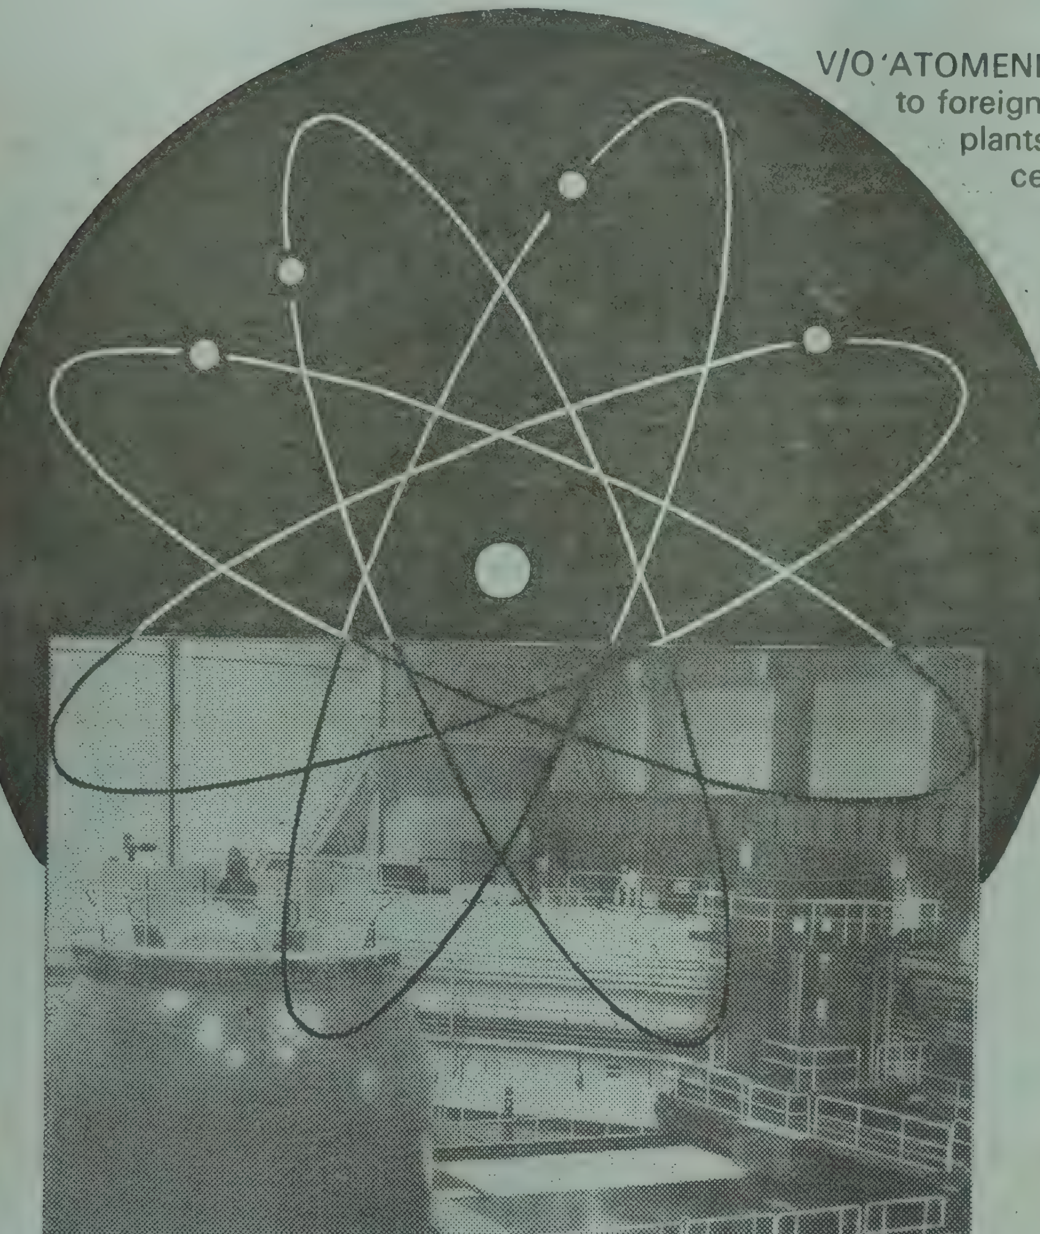
17. Thus, while the striking gains made by the Company in the year under review were substantially due to changes in the Government policy, they could not have been achieved without the sustained effort, hard work and high morale displayed by our management and employees throughout the organisation, for which we should be, and indeed are, profoundly grateful.

J. R. D. TATA
Chairman.

Bombay, 3rd July, 1981.

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

Putting the atom to the best use.



V/O 'ATOMENERGOEXPORT' renders Technical assistance to foreign Customers in constructing nuclear power plants, nuclear facilities, nuclear research centres, complete with all related equipment; sea-water and saline water desalination plants; as well as exports and imports nuclear power generating equipment, special equipment and facilities, materials and instrumentation.

V/O 'ATOMENERGOEXPORT':

— conducts surveys required for selecting the project site;

— carries out designs as well as provides engineering services and conducts specialized site-studies and experimental work on request;

— delivers main, auxiliary, special, and construction/erection equipment;

— carries out erection, start-up and adjustment work;

— provides nuclear power plants with nuclear fuel;

— deputes its highly skilled personnel to the construction sites;

— organizes professional training of local personnel both in the Soviet Union and in the Customer's country.

CORPORATE SECTOR

In the market

Indu Nissan Oxo Chemical Industries

Indu Nissan Oxo Chemical Industries Limited (Regd. Office: R S No. 174, opp. Sonal Bangalow, Gotri Main Road, Vadodara 390005 Gujarat), will enter the capital market on July 24, 1981 with a public issue of 28,25,000 equity shares of Rs 10 each at par. The proceeds of the issue will be utilised to meet a part of the finance for the company's 12,000 tonnes annual capacity project at Bajwa, near Baroda in Gujarat, costing Rs 16.20 crores, for the manufacture of oxo alcohols. Mr Narendra Bhuva, managing director of the company, told newsmen in Bombay that the chief promoters, Indo Nippon Chemical Co Ltd were the largest manufacturers of plasticisers in the country, having an installed capacity of 11,600 tpa and an annual turnover exceeding Rs 17 crores.

The company's plant is advantageously located near its major suppliers of raw materials and consumers of its finished products. It will obtain syngas through a pipeline from Gujarat State Fertilisers Company Ltd, hydrogen from Gujarat Alkalies and at a later date di-iso-butylene from Indian Petrochemicals Corporation Ltd. Nearly 40 per cent of oxo alcohols manufactured by Indu Nissan will be consumed by Indo Nippon. Oxo alcohol is a main raw material in the manufacture of Alasticises. At present about 13,000 tonnes of oxo alcohol are imported annually in the country, while there is an indigenous licenced capacity of about 13,000 tonnes. The total demand is expected to increase to 38,000 tonnes by 1983-84. In fact, Indu Nissan has applied to the Government to increase its licenced capacity by an additional 15,000 tonnes per annum, the expansion cost of which will be substantially lower.

East India Syntex

East India Syntex Ltd (Regd Office: Plot No. 18, Industrial Area, Dharuhera, Dist Mohindergarh, Haryana) has completed its project to spin polyester viscose blended yarn at Dharuhera in a record time of ten months and started commercial production since February with the help of 11,500 spindles. The company is now entering capital market on July 29, 1981, with a public issue of 6.86 lakh equity shares of Rs 100 each totalling Rs 68.60 lakhs.

Mr H. P. Lohia, chairman of the company, told newsmen in Bombay on Wednesday that the company was already in the process of expanding and placed orders for 6,000 more spindles for the first phase of expansion which was expected to be completed by September 1982. In the second phase 5,500 more spindles will be set up and thus the entire expansion project would be completed by last quarter of 1983. The break-even point for the company was 65 per cent. The turnover in 1980-81 was expected at Rs 4 crores to Rs 4.5 crores and after completion of expansion it would rise to Rs 15-17 crores. The company has already achieved 100 per cent operating capacit from the current month.

The cost of the project is estimated at Rs 406 lakhs to be met as follows: equity issue Rs 140 lakhs and term loans from financial institutions Rs 266 lakhs. The project has all the fiscal benefits accruing from being established in a backward area. There is a sustained demand for blended fabrics and since there is no gestation period at all for the project, the investors can expect a reasonably good dividend in the near future, Mr Lohia added.

Jain Spinners

Jain Spinners Ltd (Regd. Office: 92-C, Mittal Towers, Nariman Point, Bombay 400 021) is entering the capital market with a public issue of 7.5 lakhs equity shares of Rs 10 each for cash at par totalling Rs 75 lakhs. The issue will open on July 22.

The company is setting up a spinning mill at Paithan in Aurangabad district of Maharashtra with an installed capacity of 14,280 spindles to manufacture polyester/viscose blended yarn, both grey and dyed. The plant has a capacity to produce about 2.45 million kg of yarn per annum on three-shift working. The company also proposes to instal a dyeing plant to meet the dyed polyester fibre requirement.

Mr Sukhbir Chand Jain, managing directors, told newsmen in Bombay that the erection of plant and machinery was nearing completion and partial production was likely to begin by the end of this month. It was expected to achieve full capacity by the end of the this year. In the current year, at 40 per cent capacity utilisation, the turnover was estimated at Rs 3 crores, and in 1982 at 85 per cent capacity utilisation Rs 11 crores.

The company also plans to undertake expansion in 1984 to raise the installed capacity to 25,000 spindles which is the licensed capacity. The cost of this expansion is placed at Rs 4 crores and it will be met mainly by internal accruals and borrowings.

Other developments

Standard Mills: Fresh bonus issue

The Standard Mills Co Ltd, a Mafatlal group company, has turned in highly satisfying results for the year ended March 1981 despite odds of varying orders. According to a preliminary statement released on Tuesday, sales and other income of the company has risen to Rs 104.48 crores during the year from Rs 90.95 crores in 1979-80. The gross profit has gone up to Rs 12.22 crores from Rs 10.76 crores and after providing for depreciation, investment allowance reserve and taxation, the net profit is higher at Rs 4.53 crores as against Rs 3.85 crores in the preceding year. After making certain adjustments the amount available for appropriation is Rs 4.78 crores (Rs 4.43 crores). Out of this Rs 3 crores (Rs 2.90 crores) have been transferred to general reserve and Rs 1.43 crores (same) for proposed dividends of Rs 22 per ordinary share and Rs 5.72 per preference share.

The good news for the shareholders is the board of directors' recommendation for the issue of bonus shares—the company's fourth since 1971—in the ratio of two-for-five. The earlier bonus issues were in 1971 (one-for-one), 1975 (one-for-four) and 1978 (one-for-five).

As explained by Mr C. C. Maniar, whole time director of the company in charge of textile division, the remarkable point about improved results was that these were achieved despite constraints of power and persistent rise in input costs. Last year alone prices of cotton had risen by 17 to 20 per cent, polyester from Rs 77-80 per kg to Rs 91 per kg, filaments by 10 per cent, viscose and polynosic yarn by 10 to 15 per cent, wages by Rs 100 plus 35 per cent per worker, petrochemicals by 15 to 20 per cent and utility charges by nearly 50 per cent. Though the rise in selling pric was not commensurate with these increases in costs, what enabled the company to maintain profitablity was appropriate changes in product-mix. Mr Maniar was cautious in predicting the outlook for the current year since costs continued to spiral, though he expected turnover to increase further this year. This is because the company

PUBLIC SECTOR

APSFC : Unique distinction

The Andhra Pradesh State Financial Corporation has completed 24 years of useful service for the industrialisation of the State of Andhra Pradesh. It was established on November 1, 1956 with the amalgamation of the erstwhile State Financial Corporations of Hyderabad and Andhra States. During the year 1980-81, the corporation has achieved the unique distinction of retaining the coveted No. 1 position for the second year in succession in all the areas of sanctions, disbursements and recovery, amongst all the state financial corporations in the country. The sanctions and disbursements made by the corporation since inception have crossed Rs 200 crores and Rs 125 crores respectively.

The cumulative sanctions and disbursements as at March 31, 1981 stood at Rs 209.70 crores and Rs 130.04 crores respectively. The gross financial assistance sanctioned, disbursed and amounts recovered during 1980-81 were the highest as compared to all the years since inception of the corporation. The gross sanction of assistance given by the corporation during 1980-81 has been higher at Rs 47.38 crores compared to Rs 39.63 crores during the previous year. The disbursements have also been higher at Rs 30.65 crores compared to Rs 27.48 crores in the previous year. The financial assistance outstanding as on March 31, 1981 has gone up to Rs 100.03 crores from Rs 75.66 crores as at the beginning of the year which meant an increase of 32.22 per cent.

The recovery of overdue amounts during the year has touched a record level. The total overdues of principal and interest at the end of the year were Rs 9.65 crores. Out of the total current demand of Rs 10.51 crores towards principal and Rs 9.14 crores towards interest, the corporation during the year has realised Rs 6.63 crores and Rs 6.56 crores respectively. The percentage of overdues in terms of the loans and advances outstanding as at the end of March 31, 1981 works out to only 9.84 compared to 12.23 at the end of the previous year.

During the year an amount of Rs 23.19 crores was sanctioned to 1,590 units located in backward areas compared to Rs 17.10 crores sanctioned to 1,186 units in the previous year recording an impressive growth of 31 per cent in terms of amount and 34 per cent in terms of number of units. During the year an amount of Rs 28.32 crores was sanctioned to 2,312 small and tiny sector units. The small scale and tiny sector units constitute 96 per cent of the total number of loans and, in terms of amount they constitute 70 per cent as at the end of March 31, 1981. An amount of Rs 1.16 crores was sanctioned to 68 units under various self-employment ventures during the year. Out of these, 31 loans were sanctioned to A.P. State Road Transport Corporation-sponsored passenger bus programme for an amount of Rs 55.37 lakhs providing employment opportunities to 248 educated unemployed candidates belonging to the weaker sections of the society.

The additions to the APSFC's share capital made by the State Government and IDBI during the year were Rs 3.79 crores which included an unilateral contribution of Rs 50 lakhs received from IDBI to equate their shareholding with that of the State Government. This increase enabled the corporation to raise the required loans from IDBI by way of refinance to meet its growing commitments.

The corporation operates through 12 branch offices and 8 field offices besides the head office at Hyderabad. Three of the branch offices and one of the field offices were opened during 1980-81.

Andhra Bancard

Andhra Bank is shortly launching a Credit Card, namely, the Andhra Bancard. Andhra Bancard is India's first bank credit card affiliated to VISA International, the world's largest credit card system. VISA has an ever-growing clientele of card-holders numbering about 87 million at present. With the Andhra Bancard, one can sign for any goods and service one needs and pay for them later. Currently, there are 2,000 VISA merchant outlets who would be honouring the Andhra Bancard also. The Bank is also enrolling a wide variety of outlets throughout the country including the best of hotels, restaurants and departmental stores.

Use of the Andhra Bancard gives the cardholder an interest free credit for a period of four to six weeks. The cardholder can charge any of his expenses to his Andhra Bancard and the Bank will make the necessary payments to the merchant establishments. The amount will be collected by the Andhra Bank from the cardholder during the first week of the following month. No interest will be charged from the date of purchase till the 15th day from the date of the statement. On the unpaid balances at the close of business on the 15th day, interest at the rate of 2 per cent will be charged. There is no admission fee or any service charge.

Similar adjustments are somet made in other items also. Totals may not add up due to rounding off.

EQUITIES

Nervous bulls

Bombay, July 6

After enjoying near-boom conditions over the past one month, equities came in for nervous bull offerings during the past week. The delay in 'pay in' and 'pay out' of June 19 settlement caused fears among investors. According to certain circles, the market has been facing payment problems involving crores of rupees as a result of over-trading in Tata Steel, TELCO, ACC, Premier etc.

In view of the speculative activity, the stock exchange authorities had to issue warnings twice during the week against excessive speculative trading. They also threatened stringent measures such as extending earlier restrictions on 17 scrips in 'A' group to all the scrips in the same group.

Against such unfavourable market conditions, equities resumed trading on a weak note. Century started lower at Rs 795 against the previous official closing of Rs 811 and the scrip declined further to Rs 778 on increased selling pressure. With the partial recovery later to Rs 785, the net loss was Rs 26. Standard dropped from Rs 670 to Rs 653 before staging a recovery to Rs 658, indicating a net loss of Rs 12.

TELCO, however, bore the brunt of the selling. The selling developed following the announcement of unchanged dividend of 20 per cent for 1980-81. The market expected at least a two points increase in the dividend. The profit figures also fell far short of market expectations. The scrip nosedived from the opening level of Rs 800 to Rs 685 on release of bonus issue, dividend and profit figures. Subsequently, the scrip made a small recovery to Rs 685. On balance, it yielded Rs 49. Tata Steel, ACC, Gwalior Rayon, Polychem, Mukand, Larsen and National Rayon also participated in the downswing. G.E. Shipping, Scindia, Bombay Dyeing and Voltas, however, ruled steady to better.

In the cash section, Baroda Rayon, Indian Rayon, J.K. Synthetics, Nirlon, South India Viscose, Gujarat Steel, Mahindra Ugine, Zenith Steel, Ashok Leyland, Kinetic, MICO, GSFC, Indian Hotels, Colgate and Mahindra and Mahindra were easy. On the other hand, Reliance, Garware Nylons, Siyaram, MALCO, KSB Pumps, Bajaj Auto, Bayer, Ratnakar Shipping, PIL and W.I. Erectors finished on the plus side.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE

FOR MONITORING CURRENT

DEVELOPMENTS IN THE INDIAN

ECONOMY

* The research work of the Bureau is organised through these nine Divisions:

(1) Agriculture,
(2) Industry,
(3) Corporate Sector,
(4) Regional Economics,
(5) Banking and Finance,
(6) International Economics,
(7) Unorganised Sector,
(8) Science and Technology, and
(9) Special Studies.

* Each Division is manned by experts who have specialised in their respective subjects.

* Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

* Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

* Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

All enquiries may be addressed to:

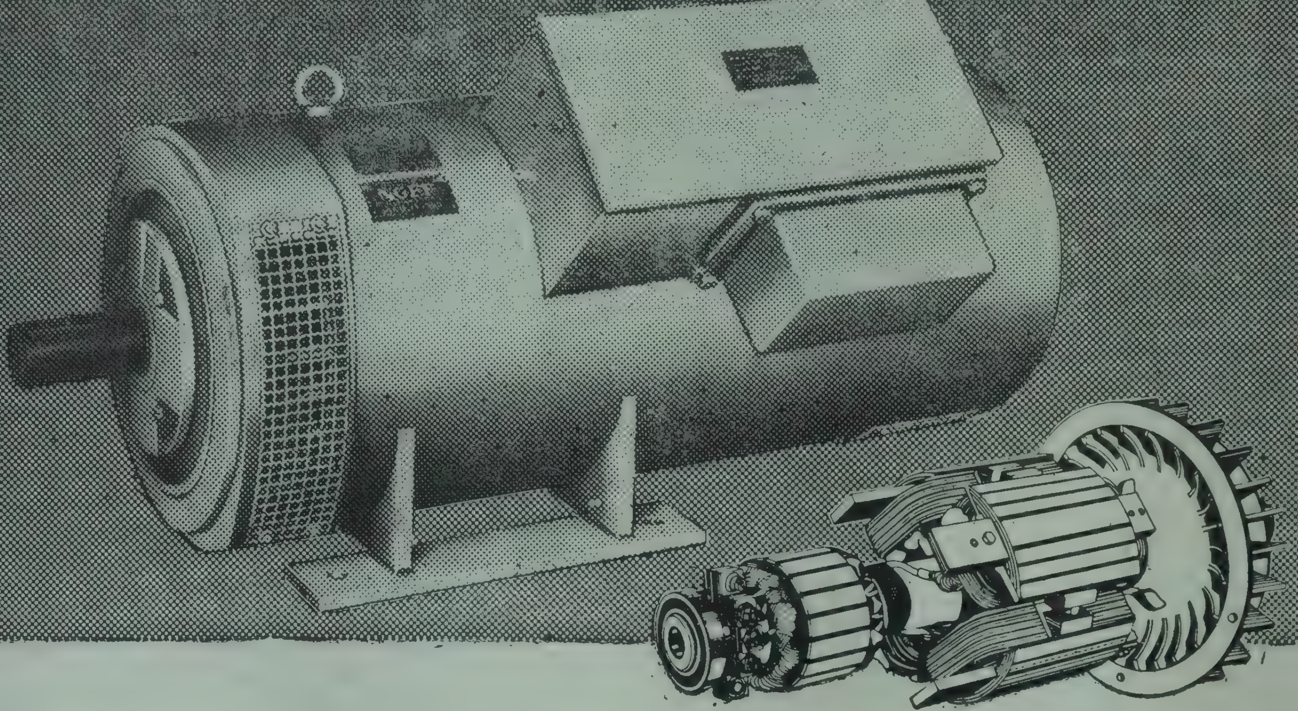
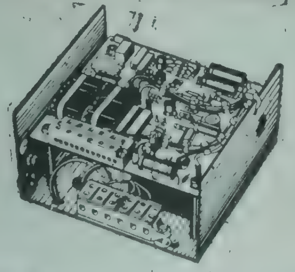
NGEF brings the latest proven, reliable technology of AEG-TELEFUNKEN in the widest range of Brushless Alternators — 8 KVA to 1150 KVA with superior Class 'F' insulation



Special highlights:

- **Less maintenance due to the absence of brushes, sliprings and commutators**
- **No failure of insulation or risk of fire hazards due to the absence of carbon dust**
- **Class 'F' insulation for all electrical parts — non-hygroscopic, preventing absorption of moisture**
- **Compact, sturdy electronic regulator common for all outputs that can withstand shocks up to 4 g on the Richter scale**



- **±0.5% voltage regulation at all loads**
- **Reference voltage adjustment up to ±5%**
- **Fast voltage build-up enabling better motor starting**
- **Fast transient response (No-load to Full-load — 200 to 600 milliseconds)**
- **Smaller size of base plate resulting from high output to weight ratio**
- **Ideally suited for parallel operation with the grid or other generators**

In the mid-sixties NGEF introduced, for the first time in India, the latest IEC frame sizes and class 'E' insulation instead of class 'A' insulation for AC electric motors. Over the years, this technology has proved itself, with other manufacturers following suit. Now NGEF does it again, introducing the widest range of Brushless Alternators with class 'F' insulation.

NGEF Alternators conform to IS: 4722, VDE 0530 and BS 2613. NGEF also offers special types suitable for marine duty as per the specifications of Lloyds, Indian Register of Shipping, American Bureau of Shipping and others, applications requiring constant voltage to frequency ratio and machines with sinusoidal wave forms, etc.

The normal radio interference up to grade 'G' as per VDE:0875 is provided, but NGEF can also offer as per grade 'N' or 'K' for special applications.

Market Gossip

No dividend freeze

THE Government has revealed its anti-inflationary package. The Bank rate has been raised by one per cent, compulsory deposit rates for incomes above Rs 50,000 have been raised and banks, companies, co-operative societies and partnership firms have been directed to repay deposits made with them by any person by account payee cheques or bank drafts when the amount of deposits together with interest is Rs 10,000 or more. The last measure, it is hoped, would curb *benami* transactions. But the much expected dividend freeze is not there and the stock markets are happy. Dalal Street, of course, has not done any business during the week ending July 11 (and there are doubts whether it will transact any business during the week ending July 18) and conclusions can be drawn only from the Kerb dealing. The Bank rate hike has apparently not worried the stock markets because lending rates are already high and an increase in the Bank rate of one per cent makes no difference. Immediately after the announcement of the anti-inflationary package on July 11 the shares were steadier in Kerb. The Century was initially marked down from Rs 755 to Rs 740 but rose to Rs 775. Tata Steel after declining from Rs 260 to Rs 250 rose to Rs 286 and Telco were quoted at Rs 680.

Gold on retreat

FOR the first time on July 7 gold dropped in 20 months below the $400 troy ounce level—$399.50. There had been a continuous fall in recent days and during the week ending July 4 itself the decline was as much as $30 in London. The market has rallied somewhat and by July 10 the yellow metal was quoted at $410. It is not known whether this rally will be maintained.

Some gold experts had hoped that the central banks would support gold if the price dropped below $430. This has not happened and uncertainty has developed in gold prices. Some dealers expect the price to drop even to $375 if the present high rates of interest are maintained. In fact, it is the high interest rates whether in Europe or America and the strength of the dollar that has been behind the continuous decline in gold prices. There were also indications that South Africa, the largest producer of gold in the world, unlike last year, would sell all the gold it produced on the international markets in view of the fact that the country is facing some balance of payments problem. It had held back last year 66 tonnes out of its over 700 tonnes production. That country has also taken to selling gold in futures market rather than in spot. There may also be increased sales from the Soviet Union.

Will this have an impact on the domestic market? Gold prices have been ruling steady above Rs 1,600 per 10 gm during all this time of the decline in the world markets. Once again world gold has become cheaper by Rs 350 to Rs 400 per 10 gm and trade sources fear that there could be increased smuggling of gold in the country. Already some three to five tonnes of gold are reported to have found their way in the country during the months of January to June this year.

Turmeric in crisis

THE turmeric market is facing very rough weather. There has been a steep fall in exports and domestic consumption is lower, too, at a time when production has been normal. The turmeric output in 1980-81 is placed at 1,44,000 tonnes. There was a carry-over also of 15,000 tonnes from the previous year. Its production, however, has been fluctuating—it was 1,79,000 tonnes in 1979-80, 1,64,000 tonnes in 1978-79 and 1,85,000 tonnes in 1977-78.

Domestic consumption is around 1,20,000 tonnes. Exports have also declined owing to the war between Iran and Iraq. During the year 1980-81 exports totalled only 3,000-4,000 tonnes as compared to as much as 21,000 tonnes in 1979-80 and 10,300 tonnes in 1978-79 and 9,400 tonnes in 1977-78. According to trade sources, the doubling of the exports in 1979-80 (normal exports are 10,000 tonnes) was because of silver being smuggled through turmeric bags. Following reports about smuggling Bombay customs had confiscated about 1,200 kg of silver which they found was being smuggled through turmeric bags. Naturally despite "heavy" exports of turmeric the price was not at its best that year. Actually it was in 1977 that turmeric fetched the highest price of Rs 900 per 100 kg. It dropped to Rs 250 in August 1980 and it is now around Rs 300 to Rs 350 per 100 kg.

Sangli is the most important centre for turmeric and it is reportedly saddled with heavy stocks of 32,600 tonnes at present against the normal stocks of 15,000 tonnes. Sangli is also the one centre which runs forward trading in turmeric. If there is no improvement in prices and the demand does not pick up, traders feel production is bound to suffer in future.

Aluminium : Glut in Japan too?

THE present glut in aluminium is not a phenomenon restricted to India alone, but elsewhere too it is causing considerable heartburn to aluminium producers. In Japan, for example, it has become virtually a question of survival for producers as demand continues to be sluggish because of industrial recession and at the same time cheap imports of aluminium are flooding the markets. The Japanese Government, which has realised the gravity of the situation, is now discussing with the producers plans to cutback minimum production to a level that is considered necessary for the industry to survive. It appears the producers are inclined to accept an output level of 700,000 tonnes as against the present 1.1 million tonnes a year. But they have also emphasised that in order to make output cutbacks really effective, it will be equally necessary to curb the present growth in imports of the metal.

Subdued conditions in cotton

Bombay, July 6

Subdued trading conditions prevailed in the spot cotton market during the past week with limited business passing. The week witnessed a raging controversy as to whether the monopoly cotton procurement is dead or is dying or will die soon enough.

The strong representation made by the Indian Cotton Mills' Federation against any form of monopoly anywhere in the marketing of cotton has been mainly responsible for stirring up the storm over the scheme. The ICMF made it categorically clear that no useful purpose would be served by extending the scheme to Gujarat as had been proposed by vested interests in Gujarat. At the time the proposal was made, it is significant to note. Mr Pranab Mukherji was intermittently camping in Ahmedabad in connection with a by-election.

With the expiry of its term by the end of June, the scheme in Maharashtra did not get the green signal for its continuance from the Centre. There were strong reports that the scheme was dead in the State. The following day, greatly agitated by such reports, the State Government came out with the declaration that the scheme was very much alive.

Soon, the Union Finance Minister entered the fray and declared quite unequivocally that the Centre was not in favour of monopoly procurement scheme in cotton by the State Governments. Instead of such schemes, the Minister favoured support prices to ensure remunerative returns for the cotton growers. In other words, this meant that Maharashtra Government would have a tough time to get approval from New Delhi for the extension of the scheme for another year, let alone ten years as had been originally mooted by the concerned interests. As for Gujarat, the scheme is as good as stillborn.

In the meanwhile, hectic lobbying is going on in New Delhi to persuade the authorities to permit the continuance of the scheme in Maharashtra as its suspension would grievously hurt the interests of the poor farmers, in the welfare of whom both the Centre and the State were committed.

The Government of India also came out during the week under review with an announcement of an upward revision in the subsidy on controlled cloth as also in the retail selling prices of such cloth. The total subsidy would go up by Rs 8 crores to Rs 48.75 crores.

Now that the Government has accepted the need to revise the prices of controlled cloth in keeping with the escalation in the cost of production, mill circles are anxiously awaiting the Government's decision in respect of cheap cloth too. The Indian Cotton Mills' Federation has, in fact, sought the obolition of the scheme as the existing selling price fixed by the Government is far below the cost of production and no mill is in a position to suffer the loss in consequence.

The following has been the trend of prices of some of the leading cotton varieties :

(Rs. per candy)

	July 3	June 26
Digvijay	5,050-5,150	5,100-5,150
Kalyan	4,750-4,850	4,800-4,850

MCU 5 Guntur	5,800-6,050	5,900-6,100

Increase in yarn prices

Bombay, July 6

A rise in prices was noticed in the local yarn market during the past week 150D NRC, 120D NRC, 150D CR, 120D CR, were quoted higher at Rs 51.21. Rs 53.96. Rs 50.66 and Rs 53.96 against Rs 49.27, Rs 52.86. Rs 48.72 and Rs 52.86 respectively. The prices of 100D SIV and 100D acetate, however, remained steady at Rs 55.07 and Rs 41.85 respectively.

Sacking, hessian gain

Calcutta, July 6

During the past week jute goods in the Calcutta gunny market steadied up towards the close after ruling relatively quiet in the earlier part on speculative buying aided by rumours that the Centre would help the jute industry in building up a buffer stock of goods. Jute industry representatives were in the capital this week for discussions in this connection.

Prices of both sacking and hessian gained as a result of the speculative buying. However, genuine business was restricted in the absence of new orders from overseas countries and slow offtake on domestic account.

The fibre market was steady during the week reflecting a rise in the floor price of fibre announced by the Centre.

The fixation by the Union Government of a higher floor price for raw jute at Rs 175 a quintal—Rs 15 more than last year—has been received with mixed feelings in industry and trade circles. Both growers and traders have welcomed the increase but the industry's misgivings in this regard were expressed by its spokesman.

The industry feels that with the jute mills already hit by a recession in demand leading to a pile-up of jute goods stocks primarily because of domestic prices ruling above those of competitors, there is need for caution to add up to the cost. The need to give a fair return to the grower for his produce is certainly important and should be looked into, but avenues of assuring this by other means should receive attention rather than resorting to a price hike of raw jute—the essential raw material accounting for over 50 per cent of the industry's production cost.

It should be noted, he said, that this is the first time that such higher rate of increase on this raw material has been announced. In line with the recommendations of the task force on jute textiles, adequate incentives for cultivation and production of quality fibre will be built into the price structure of raw jute notified by the Jute Commissioner, it is stated.

The Jute Corporation, which is to ensure price support to raw jute, proposes to absorb this year 2.11 million bales against 1.06 million bales last year.

At the annual general meeting of the East India Jute and Hessian Exchange Limited held here recently, Mr Braja Mohan Mahanty, union Deputy Minister for Civil Supplies, said that he had reports of rampant illegal forward trading in many commodities including raw jute and hessian. The minister did not know if any of the members of the exchange were participating in such activities. Forward trading at present was permited in sacking alone.

He reminded the exchange of its responsibility to keep a watch on such activities and

THE HINDOOSTAN SPINNING AND WEAVING MILLS LIMITED

NOTICE

The HUNDREDTH Annual General Meeting of the Shareholders of the Company will be held at "Patkar Hall", Nathibai Thackersey Road, [Off Maharshi Karve Road, Bombay-400 020. on THURS DAY August 27, 1981 at 4.00 P.M. The Notice convening the Meeting and the Explanatory Statement annexed there to are being forwarded separately to all concerned.

Pursuant to Section 154 of the Companies Act, 1956, the Register of Members in respect of Equity and Preference Shares of the Company will remain closed from FRIDAY, August 7, 1981 to THURSDAY, August 27, 1981, both days inclusive.

BY ORDER OF
THE BOARD OF DIRECTORS

Registered Office :
"Sir Vithaldas Chambers",
16, Bombay Samachar Marg,
Bombay-400 023.

E. VIJAYAGOPALAN
SECRETARY

Date : July 8, 1981.

report them to the authorities concerned for approriate action. The reputation and competence of the exchange would be judged by its success in eradicating this evil, he said. Mr B. N. Kapre, chairman, Forward Markets Commission, in his address said that jute mills and traders should see that the growers got the minimum statutory prices for raw jute. They should keep in mind that the Director-General of Supplies and Disposals bought B-twills from the mills generally on a cost plus basis taking into account the statutory minimum price payable to the growers, he said. Mr Balakrishna Dalmia, president of the exchange, in his speech said he was worried about the Essential Commodities (Special) Powers Bill 1981. The existing laws, he said, were adequate to deal with unscrupulous traders. The bill aimed at arming the executive with mandatory powers for summary trial and for making economic offences non-bailable. These powers were likely to be misused, he apprehended.

THE STANDARD MILLS COMPANY LIMITED

Registered Office:

Mafatlal Centre
Nariman Point
Bombay-400 021.

To

The Members,
The Standard Mills Company Limited.

At the Meeting of the Board of Directors of the Company held on Tuesday, the 14th July, 1981, the Directors have recommended to the Members the declaration of the following Dividends, subject to deduction of tax, if any, for the year ended 31st March, 1981 :

(a) Rs. 5.72 per share on 6,000 First and 6,000 Second Cumulative Redeemable Preference Shares of the Company.

(b) Rs. 22 per share on 6,46,824 Equity Shares of the Company.

The Dividends as recommended by the Directors when declared by the Members at the ensuing Annual General Meeting of the Company to be held on 1st September, 1981, will be paid at par at all the Branches of Central Bank of India, in India, from Thursday, the 10th September, 1981, to those Members whose names appear on the Register of Members of the Company as on 12th August, 1981.

The Board of Directors have also recommended issue of Bonus Equity Shares in the ratio of 2 Bonus Equity Shares for every 5 Equity Shares held in the Company, subject to requisite consents from the Members, Financial Institutions and the Controller of Capital Issues, being received.

The Register of Members and the Share Transfer Books of the Company will remain closed from Thursday, the 23rd July, 1981 to Wednesday, the 12th August, 1981 (both days inclusive) for the purpose of payment of Dividends for the financial year in ended 31st March, 1981.

Members are requested to notify immediately change in their addresses, if any, to the Company's Share Department at Rustom Building, 29, Veer Nariman Road, Bombay-400 023.

By Order of the Board
B. D. DATAR
Secretary.

Dated: 14th July, 1981.

Edible oils flare up

Bombay, July 6

Edible oil prices flared up in the oilseeds market during the past week. Groundnut oil spurted by Rs 9 to Rs 145.75 per 10 kg including four per cent sales tax imposed by the Maharashtra Government since July 1. The firmness was attributed to scarce supplies from producing centres.

Reports of favourable weather in groundnut producing areas made no impact on the price front because of uncertainty of supply from Saurashtra. Groundnut Karad bold, Saurashtra bold and Saurashtra quality hardened by Rs 7 each to Rs 592, Rs 597 and Rs 602 respectively per 100 kg.

The firmness in groundnut oil pushed up the prices of imported oils. Palmoleine jumped by Rs 10.50 to Rs 145, soyabean by Rs. 5.50 to Rs 136 and RBD by Rs 4 to Rs 117 per 10 kg including 4 per cent sales tax.

Costorseed came in for fresh support while its oil edged up on scattered export inquiries. Madras small and Kanpur bold rose by Rs 6 each to Rs 312 and Rs 302 per 100 kg. Castor commercial oil gained 90 paise at Rs 68.65 and BSS oil 25 paise at Rs 73.50 per 10 kg.

In view of the hardening tendency in groundnut oil, linseed oil improved by Rs 7 to Rs 120 per 10 kg including 4 per cent sales tax. Linseed bold, however, yielded Rs 20 at Rs 460 on discouraging advices from the north.

Most of the cakes were on the decline on slack export demand. Castor cake, however, moved up by Rs 14 to Rs 754 per tonne.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :—

	4.7.81	27.6.81
G. nut		
Karad Bold	592.00	585.00
G. nut oil	145.75	136.75
Cast. Md. Sm.	312.00	306.00
Cast. oil com.	68.65	67.75
Cast. oil BSS	73.50	73.25
Linseed Bold	460.00	480.00
Linseed oil	120.00	113.00

Tea : Assam mediums firm

Calcutta, July 6

At the weekly leaf tea auctions the offerings of 22,109 packages of CTC teas met with fair demand. Best Assam brokens sold at irregular levels whilst the good sorts showed a lower tendency. Plain and medium varieties sold at firm to dearer levels. The blenders operated at lower limits whilst the Gujarat buyers were extremely quiet and the Gulf was selective. There was selective continental inquiry on the best liquoring brokens on offer. A line of Hajua BOP was sold at Rs 31.50 which was the highest price realised in the sale for an Assam broken grade.

Dooars brokens plain and medium showed a lower tendency whilst the better descriptions on offer sold at firm to dearer rates. The blenders operated actively, whilst the Gujarat buyers were extremely selective and Punjab was virtually out of the market. The USSR once again operated for the better bolder brokens up to Rs 15. All fannings met with better demand and sold at dearer levels. Medium descriptions on offer were often dearer by Re. 1 to Rs 2 per kg. Best Assam fannings sold between Rs 20 and Rs 23.50. There was good inquiry from the ARE, the UK shippers and the major blenders, whilst the Gujarat buyers operated largely for dooars fannings on offer.

The 6,419 packages of Darjeeling teas offered met with good demand. Plainer whole leaf grades sold around last levels, whilst the improved liquoring lines were dearer with quality. Selected teas with second flush character sold well. These elicited inquiry from West Germany and continent, with support from the USSR. The cheaper varieties were absorbed by one of the blenders and the USSR. Darjeeling brokens sold readily at fully firm to dearer rates and met with inquiry from the USSR, Gulf, rontinent and internal buyers. Fannings sold at irregular rates with the brighter liquoring lines showing a dearer tendency, and were absorbed by the traditional exporters as well as the local dealers.

The 45,904 packages of orthodox teas offered met with a good demand. All orthodox brokens were absorbed at fully firm to dearer rates following quality. The USSR continued to absorb the bulk of the offerings whilst the Gulf operated selectively. Whole leaf grades followed a similar trend. Tippy lines on offer were largely absorbed by the USSR. Afghanistan was active for the medium categories on offer and these sold at firm to dearer rates. There was also selective inquiry from Iran. Good liquoring orthodox fannings sold at dearer rates. The remainder were absorbed by the ARE at firm to dearer levels.

The 14,012 packages of dust offered at the sale met with a fair demand. All medium and good CTC dusts with improved liquors sold at firm to dearer rates. The remainder were easier particularly the best categories. Exportable Pekoe dusts were also easier. The blenders operated with lower limits whilst the Gujarat buyers are also less active. The ARE continued to offer good support whilst the UK shippers operated for better liquoring Pekoe dusts on offer. Selected brighter liquoring orthodox dusts sold at dearer rates whilst the remainder eased in value.

Grains gain ground

Bombay, July 6

Foodgrains ruled steady to better and their prices gained ground in the local market during the past week. This was attributed to poor arrivals and good demand.

Among cereals, wheat Saurashtra variety recorded a rise of Rs 6 over the last week at Rs 208-230 per quintal due to poor supplies. The inflow averaged 600 to 700 bags per day by road from Gujarat. Wheat superior variety ruled steady at Rs 290-330 per quintal. Advices from producing centres were quiet.

Activity in rice was limited. Surti kolam was quoted steady at Rs 340-400 per quintal and basmati at Rs 450-600 per quintal. Demand was at a low ebb.

In coarse grains, jowar, bajra and maize prices persisted at the previous levels. The turnover was poor. Arrivals were limited. Jowar was traded at Rs 185-225 per quintal, bajra fetched Rs 165-230 per quintal and maize was in demand at Rs 155-160 per quintal.

Among pulses, gram recorded a rise of Rs 18 to Rs 380-395 per quintal. Arrivals were meagre and the demand was good. Masoor dal spurted by Rs 10 to Rs 501-505 per quintal on good demand and paucity of supplies. The undertone was firm. Tur dal advanced by Rs 12 to Rs 485-575 per quintal, urad (Khandesh) and moong chumki ruled steady at Rs 320-325 per quintal and Rs 425-450 per quintal respectively.

Sugar drifts

Bombay, July 6

Sugar prices drifted further during the past week owing to sustained heavy offerings by producers and local stockists. Both seemed anxious sellers in view of the larger release for internal consumption for July and reports of the impending import of two lakh tonnes. The undertone was weak and demand dull. Sugar C-30 lost Rs 11 to Rs 649-662 per quintal. The price of C-30 grade sugar as on July 4, 1981 was lower by Rs 8 per quintal than on the corresponding date a year ago.

The wholesale market received 21,027 bags of sugar during the week under review. The week-end stocks thus declined from 3,851 bags to 2,443 bags. The State sugar factories were unloading the commodity at Rs 625-630 per quintal—Rs 30 lower than last week's level.

Khandsari superior was quoted lower by Rs 30 at Rs 600 per quintal. The week-end stocks with the dealers improved from 423 bags to 775 bags.

Gold and silver erratic

Bombay, July 6

An erratic tendency in both gold and silver marked the trading in the Bombay bullion market during the past week.

Standard mint gold opened at Rs 1,635 per 10 gm and eased gradually to Rs 1,610 per 10 gm before closing at Rs 1,640 per 10 gm. Ready silver (.999 fineness) opened at Rs 2,420 per kg and after dipping to Rs 2,375 per kg, it was finally placed at Rs 2,415 per kg.

Money easy

Bombay, July 6

Conditions in the Bombay short-term money market were fairly comfortable during the past week. Interest rates opened at 9 per cent and moved between 7 per cent and 9 per cent till July 2 (Thursday) and declined to 5 per cent on July 3 (Friday) only to harden to 9 per cent at the close of the week.

Spurt in aggregate deposits

Bombay, July 6

Aggregate deposits of all scheduled commercial banks spurted by Rs 415.40 crores to Rs 39,927.24 crores during the week ended June 26, 1981. Bank credit expanded by Rs 22.75 crores to Rs 26,294.06 crores. The balances of banks with the RBI increased sharply by Rs 251.36 crores to Rs 4,516.82 crores and their borrowings from the RBI went up marginally by Rs 1.56 crores to Rs 564.26 crores.

COMPANY NOTICES

BHARAT STEEL TUBES LIMITED

NOTICE

It is hereby notified for the information of the public that Bharat Steel Tubes Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for shipping. The estimated annual value of services rendered will be approximately Rs.5.70 Crores. Other particulars of the proposed new undertaking are as under:—

(1) Name of the proposed undertaking	: No new name will be given to this undertaking.
(2) Name(s) of person(s) or authority/authorities proposing to establish the new undertaking, where it is a body corporate furnish details of its management structure together with those of the proposed undertaking.	: Bharat Steel Tubes Limited is managed by a Managing Director. The new undertaking will be managed by the management of Bharat Steel Tubes Ltd.
(3) Capital structure of the applicant person or authority and of the proposed undertaking :—	Rs. in Crores
Authorised Capital of the Company	: 10.00
Issued, Subscribed and paid-up	
—Equity	: 2.70
—Preference	: 0.80
(4) Proposed location of the new undertaking	: Vessels shall ply over international Sea, but the operations shall be controlled from India.
(5) Brief outline of the cost of project the scheme and source of finance.	: The estimated Capital outlay is Rs.21.6 Crores which is proposed to be financed 10% by internal sources and 90% by long term loans.

Any person interested in the matter may take a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice intimating his views on the proposal indicating the nature of his interest therein.

V.K.HAJELA
VICE PRESIDENT (PROJECTS)

Dated this 2nd day of July, 1981

Beyond headlines

The control factor

By SIDDHARTHA GANGULI

BUREAUCRACY—one of the common approaches to controlling in administration, thrives on overcentralisation. In the overcentralised administrative system, quite often, hasty decisions are taken on proposals that had hardly been discussed. A glaring example is President Carter's bill on energy crisis which was framed and passed in haste to be torn to pieces by the US Senate. This and other major ills of the bureaucratic system of government were brought to the fore once again by the Parkinson Law famed Professor Cyril Northcote Parkinson while addressing the Indian Chamber of Commerce at Calcutta. The theme of his talk was 'Excessive Control'.

Rejecting excessive centralisation and its associated problems as 'nonsense', the septagenarian satirist highlighted that most central governments were pursuing policies of making regional governments mere executing agencies of the central decisions. He suggested that the centre ought to relieve itself of responsibilities of local nature and devote its time and energy to study in detail and formulate policies on national and international matters. The regional legislatures, on the other hand, should decide on the local issues such as welfare, housing, health, and education since the needs related to these were likely to vary from one region to another as there might be variations in culture, customs, dialect, habits, and so on.

As recent Indian experiences on the continuing Centre-state tussle and sustained struggle for authority between the Central Ministries and the public sector undertakings controlled by them have shown, Parkinson's recommendations regarding decentralisation would have to cross many hurdles before they could be implemented in practice. And, most of these hurdles are expected to be caused by the human factor as no individual is willing to share power with another. Same is the case with a group of likeminded individuals as represented by the party in power. Parkinson himself has, perhaps inadvertently, implied the importance of the human factor while painting the picture of a bureaucrat in the following definition: "A bureaucrat is a man with a desk, an IN tray, an OUT tray, and a tray in the middle marked LBW (LBW standing for 'Let the b...... wait')". The bureaucrat—the administrator, feels as insecure as his minister-boss and thus holds tightly on to his power by creating a maze of rules and regulations, systems and procedures. The minister achieves the same purpose by formulating new laws and policy directives, and this he does as soon as he gets the seat of power.

Not fond of bureaucracy or democracy either, the best-selling parodist said that the best way to curb bureaucracy, was for a minister to repeal two laws before passing a new one. Similarly, he suggested that whenever there was a proposal to set up a new committee, the two existing committees should be abolished. Otherwise, promulgation of new laws only added to the confusion that prevailed owing to the existing ones and creation of new offices and committees only delayed decisions on an issue. Now, the feasibility of applying this Parkinsonian prescription also in practice will depend on how diplomatically the whole exercise could be handled by the government in power without antagonising its predecessors who were responsible for framing the prevailing laws and policies and without inviting adverse criticism from various other opinion groups and the society at large.

The 72-year old humourist sounded like an armchair authoritarian when he strongly advocated the practice of ruthlessness in the style of governance of a country. This particular view, he said, was the spontaneous outcome of an instinct that he derived from his association with the armed forces. The inherent authoritarianism in him was further confirmed when he vehemently opposed the practice of extending assistance to sick industries. "Let the industries which cannot look after themselves go bankrupt rather than surviving on government grants. Finish with such industries, bury them and start again" —these were his words.

If one attempted to rationalise on this assistance issue by bringing in the analogy of human sickness, it would be easily observed that sick industries could be classified into three distinct categories: (i) 'given-up' cases which have no chance of recovery and survival even with the best possible resuscitation intervention; (ii) those which are still not out of danger but not so serious as to preclude any chances of recovery; and, (iii) those for which the ailment is of a trivial nature—a little bit of discipline and timely check would help them to recover fully. While the Parkinsonian formula would be totally acceptable for the 'given-up' cases and also for the trivial ones (where it will not be insensible to leave it to the owners and the management to chart out and implement their own strategy for restoration of health), for those industries which would fall under the second category, intervention to provide the necessary health care would be considered as one of the primary responsibilities of the government. Apart from this rationale, there would be many more constraints in employing the ruthless authoritarian style—which explains why the British premier Mrs Margaret Thatcher's stance failed, when she tried to apply this approach.

But the Professor was perhaps right in one sense while advocating ruthlessness. It is true that people become more innovative when they are forced to look for new pastures. 'Necessity is the Mother of Invention'. Citing the example of British Leyland, Parkinson said that if it had been closed, an alternative and improved technology would have been developed benefitting the automobile industry as a whole. On the contrary, the British Government continued to pump more and more funds in and as a result of such charity which led to a feeling of security amongst the members of the staff, the company had not been able to bring about any basic change in the technology of the engine ever since the first car rolled out of its factory. Indians, by nature, being fatalistic and low in achievement orientation, to what extent the Parkinsonian hypothesis will hold good for India is a big question which Parkinson himself has answered. According to him, India should evolve her own theory on how to manage her industry instead of blindly copying the Western and Japanese models. For developing such a theory, the ancient Indian literature and culture as well as modern Indian experience of successes and failures should serve as excellent sources of ideas and information.

Dr Ganguli is corporate management and training adviser to many leading organisations.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE
FOR MONITORING CURRENT
DEVELOPMENTS IN THE INDIAN
ECONOMY

* The research work of the Bureau is organised through these nine Divisions :

(1) Agriculture,
(2) Industry,
(3) Corporate Sector,
(4) Regional Economics,
(5) Banking and Finance,
(6) International Economics,
(7) Unorganised Sector,
(8) Science and Technology, and
(9) Special Studies.

* Each Division is manned by experts who have specialised in their respective subjects.

* Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

* Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

* Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

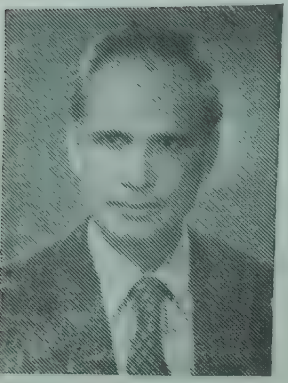
PEOPLE



Nambiar

Mr P. C. D. Nambiar, chairman, State Bank of India, has been unanimously re-elected chairman, Indian Banks' Association for 1981-82. Mr Nambiar is also a director of Industrial Development Bank of India, Agricultural Refinance and Development Corporation, Industrial Reconstruction Corporation of India and Industrial Finance Corporation.

Mr Laljeet Singh has been appointed managing director of Modern Bakeries (India) Ltd.

Mr P. N. Devarajan, who is presently chairman and managing director of Hindustan Organic Chemicals Ltd at Rasayani, has also taken over as chairman and managing director of the Indian Drugs & Pharmaceuticals Ltd. He succeeds Dr L. K. Behl. Mr Devarajan, who joined HOC in July 1977 as its general manager became managing director in October the same year and its chairman in 1978. IDPL, which is the largest public sector complex of its kind.

Devarajan

Irani

Dr J. J. Irani, who has been recently appointed a deputy managing director of Tata Iron and Steel Co Ltd, obtained his doctorate from the Sheffield University. He worked with the British Iron and Steel Research Association for five years before joining Tisco in 1968. Dr Irani, who will be based at Jamshedpur, was the winner of the National Metallurgists Day Award in 1974 and is also on the board of Guest Keen Williams Ltd and Bisra Stone & Lime Co Ltd.

Mr J. K. Bhuwalka, who is elected president of the Andhra Chamber of Commerce, has been in business for long, especially export of minerals. He is also intimately connected with the jute industry and trade. Mr Bhuwalka, who is the sole proprietor of Agarwala Trading Co, is also a director of South India Mercantiles Private Ltd and Sri Venkateswara Jute Spinning Mills Private Ltd. He is also actively associated with several trade and industry bodies.

Bhuwalka

Mehra

Mr Ganesh Pai has been elected president of the Kanara Chamber of Commerce and Industry.

Mr K. C. Mehra, who has also been appointed a deputy managing director of Tata Iron and Steel Co, will be based in Calcutta. He had joined Tisco in 1962 and after working in various positions at Calcutta and Jamshedpur he was transferred to Tata Services, Delhi, where he became resident director in 1977. In December 1978 he was appointed resident director of Tata Industries.

THE WEEK

The Union Government has decided to do a with dual pricing of on-shore and off-shore oil and fixed a uniform price of Rs 1,182 per tonne retrospective effect from July 11 this year. The p hitherto were, respectively, Rs 305 and Rs 475 tonne.

The Union Government has increased import from 12.5 per cent to 42.5 per cent in the case of types of edible oils viz, palm oil, rapeseed oil, s bean oil, sunflower oil and palmoleine oil. The c nut oil, however, has been subjected to a still hig import duty of 80 per cent as against 60 per previously. These duties will apply only to imp made by private parties and not to imports by S Trading Corporation. The step has been take mop up profits of private importers who have pla large orders abroad for cheap oils following runa prices in domestic oil markets.

The Finance Minister, Mr R. Venkataraman, declared that the Government has no intention reopen the special bearer bonds scheme even if it upheld by the Supreme Court. The writ peti challenging the validity of the scheme is now be heard by a constitution bench of the Supreme Co

All textile mills irrespective of whether they h their own draw-texturising machines or not will allowed to import partially oriented yarn (PC under open general licence, according to the Te Commissioner.

Japan will extend assistance worth Rs crores to India under an agreement signed in N Delhi recently. Of this, Rs 64.37 crores will be ject aid for expansion of telecommunication serv and second stage of Nagarjunasagar hydro elec station, and Rs 4.12 crores will be grant aid increase of food production and cultural and edu tional programmes.

Asian Development Bank has accepted from Government of India a further contribution of Rs lakhs ($280,000) to its technical assistance spe fund. This is India's seventh contribution to fund. India has thus contributed about one mil dollar towards the fund.

Wholesale price index

At 279.1, the latest available wholesale p index for the week ended June 27, 1981 did not s any change. However, at this level the index higher by 11.0 per cent than its level a year ag

COMMERCE

Why not joint sector electricity boards?

AT a recent meeting with the Union Finance Minister, Mr R. Venkataraman and the Union Energy Minister, Ir A. B. A. Ghani Khan Choudhury, the chairman of state lectricity boards (SEBs) were asked not to depend on e Central and state government subsidy but to find ays of generating internal resources so as to meet the eeds of their investment programmes. In view of the ounting losses of the state electricity boards such an dvice has not come a day too soon. It is too well known require reiteration that the finances of SEBs leave uch to be desired. During the five years ending March 979 their aggregate losses amounted to Rs 615 crores. his position further deteriorated when the revenue sses in 1979-80 reached a staggering figure of Rs 350 rores. A review of the financial position of the electicity boards by the Union Energy Ministry identified actors responsible for their poor performance. These re poor operational efficiency, uneconomic tariff strucure, transmission and distribution losses, arrears of evenue collection, delay in project implementation and ommissioning and poor accounting and management nformation system. These are almost the same factors s identified by the Committee on Power, headed by Ir V. G. Rajadhyaksha, former member of the Planning ommission, in its report submitted to the Union Governnment in September 1980. It may be noted that trade nion rivalries also play a strategic role in retarding the perational efficiency of some of the electricity boards. his is applicable in particular to West Bengal.

During the last two decades a number of committees nd working groups have been appointed to look into the verall functioning of SEBs and suggest remedial easures. The first such attempt was made in 1963 by working group set up by the Planning Commission. oon thereafter in 1964, the Venkataraman Committee ad recommended a gross return of 9.5 per cent on their apital. But during 1977-78, the latest year for which ata are available, only four electricity boards namely ujarat, Madhya Pradesh, Maharashtra and West Bengal ad earned a rate of return of 9.5 per cent and above. ven the 9.5 per cent return recommended 15 years ago nd supposed to give a net return of 3 per cent after roviding for interest charges (6 per cent) and transfer general reserve fund (0.5 per cent) cannot be regarded s adequate today if SEBs have to operate with financial ndependence. The contingent interest liabilities of the EBs to the state governments at the end of March 1978 mounted to Rs 1,000 crores.

On account of the shortage of funds with them. nly recently the electricity boards resorted to the large-scale postponement and cancellation of orders for electric conductors. Conductor manufacturers in turn did not honour their commitments of lifting stocks from aluminium producers. A number of SEBs informed the conductor manufacturers not to execute their orders till September 1981. The Gujarat Electricity Board requested not to make any supply to it before March 1982. Following this, producers of aluminium were burdened with swelling stocks of EC and CG grade metal. By March 1981 SEBs owed nearly Rs 100 crores to the conductor manufacturers and nearly Rs 60 crores to Coal India Limited.

The Rajadhyaksha Committee had submitted its report to the Government almost a year ago. Instead of acting on the expert panel's suggestions, the Government appointed a study team to look into the recommendations of the Rajadhyaksha Committee and suggest necessary action. It was only when the financial crisis of SEBs had its repercussions on other industries that the Government decided to convene a meeting of chairmen of electricity boards. At the meeting they were asked to evolve a rational pricing policy fully taking into account the escalation in the cost of generation from time to time.

It is interesting to note that out of 18 electricity boards for which data are available as many as 15 sold electricity below cost in 1978-79. Only three electricity boards namely Andhra Pradesh, Karnataka and Maharashtra sold power at average rates which were above the cost. Industries account for about 64 per cent of the total power consumption in the country and agriculture for another 14 per cent. Electricity boards are constantly under pressure from state govenments to supply electricity to agriculturists at subsidised rates. Of course, among the agriculturists the real beneficiaries of power subsidies are the big and more affluent farmers who are in a position to pay the actual cost of power supply. As regards supply to agriculture, states like Rajasthan, Bihar, Haryana, Punjab and Uttar Pradesh have shifted from metered supplies to flat tariff. Yet another problem bedevilling the finances of electricity boards is that of transmission and distribution losses. Some of the boards have recorded losses as high as 22 to 23 per cent on this account. Such losses also include thefts not only of power but also of equipment like transformers and switchgears.

State electricity boards are autonomous bodies working under the administrative control of the state governments and they are fully competent to take any steps including revision of tariff. However, in practice the autonomy of the electricity boards has been considerably diluted by the political expediency. The following remarks by the Rajadhyaksha Committee on the erosion of the autonomy of electricity boards are worth noting: "Under the Electricity Act the Board has been given wide powers, both financial and administrative, and does not need to seek the concurrence of the state government even in major items of capital expenditure, appointment and terms and conditions of service of all staff (other than the chairman and full-time members of the board), tariffs, revenue expenditure and so on..... In practice, however, the combination of a lack of job security of the full-time board members including the chairman and the need to go to the state government for loans even to carry on their day to day business, has helped to reduce the boards to a position of total subservience where the concept of autonomy, as it is commonly understood, has no meaning".

Important as it is to revise the tariff structure of electricity boards to help improve their finances, relentless efforts are required to be made to secure the maximum operational efficiency of the enterprises. During the Sixth Five Year Plan (1980-85) a little over Rs 19,000 crores—one-fifth of the total public sector plan outlay Rs 97,500 crores—would be invested for the developme of power. It is expected to create additional capac of about 20 million kw during the Plan period. Unl the working of state electricity boards is streamlin the past experience of fulfilling, nay even overfulfilli the financial targets without achieving the comme surate physical targets would be repeated. As it stan electricity boards are expected to make a negative cc tribution of Rs 22 crores to the financing of the Six Five Year Plan.

Here then is a depressing outlook for the financ health of the state electricity boards. *Commer* would, therefore, suggest that a time has arrived make structural changes in the organisational set up state electricity boards. A beginning can be made converting three or four well-managed state electrici boards into joint sector companies. The joint sect company will ensure not only autonomy but also business-like approach. It will also be free from gover mental interference. But more importantly it wou function not as a parasite but as a fruitful entity of t Indian economy.

No need to replace sales tax

THE reported statement by the Union Finance Minister, Mr R. Venkataraman, on his recent visit to Ahmedabad, that a committee would be appointed soon to consider the question of abolition of sales tax had given rise to an impression that the Government of India had decided to go beyond the brief provided by the conference of state chief ministers in New Delhi last February. It was then agreed that an expert body be set up to examine the issue of replacing sales tax with additional excise duty only on five commodities, *viz*, vanaspati, drugs, medicines, cement and petroleum products. It is good that Mr Venkataraman has now clarified the position at a meeting of the parliamentary consultative committee held in New Delhi last week. He rejected the demand for a total abolition of sales tax or its replacement entirely by additional excise duty and said that the expert committee's terms of reference would be restricted only to the five commodities that had been discussed earlier at the chief ministers' conference. As the Finance Minister has conceded the sales tax has proved the most important single and flexible source of revenue for the states. Between 1975-76 and 1980-81, sales tax revenue was estimated to have risen from Rs 1,943 crores to Rs 3,490 crores. As a result, even though the states' total tax revenue increased from Rs 3,546 crores to Rs 6,059 crores during this period the share of the sales tax in this total revenue rose from 54.8 per cent to 57.6 per cent. Any scheme to replace the sales tax by some other tax would have, therefore, to be carefully weighed.

The demand for the abolition of sales tax and its substitution by additional excise duty emanates mainly from trade and industry. It has been pleading for some time to extend the scheme to levy additional exci duty in lieu of sales tax which has been in force f over 22 years and covers cotton fabrics, woollen fabri rayon or artificial silk fabrics, sugar and tobacco inclu ing manufactured tobacco. Sales tax in the view business and industry causes hardships and the differe rates of sales tax in various states lead also to problen The states are not, however, enthusiastic about t scheme of levy of additional excise duty and, even the New Delhi meeting in February last, some oppo tion had been voiced to consider its extension to the fi commodities mentioned earlier. Right from the launc ing of the scheme, the states have been dissatisfied wi the inadequate exploitation of revenue potential additional excise duty so much so that the Fifth Finan Commission was asked to report the desirability otherwise of continuing the scheme of additional exci duty in replacement of sales tax. The National Dev lopment Council also considered the question and agre to the continuance of the scheme subject to certa conditions. They were that the *ad valorem* system excise duty be extended to all items except to unman factured tobacco, the incidence of additional excise du be raised to 10.8 per cent of the value of the clearanc and, while making the upward adjustments in bas excise duties, the Government of India should ke in view the ratio 2 : 1 between the yield of basic a special excise duty, on the one hand, and addition excise duty, on the other.

The Seventh Finance Commission has commented the "tardy progress" made by the Government of India implementing the agreement reached between it and t state governments in 1970. While the agreement stipulated that the incidence of the total excise duty be raised to 10.8 per cent of the value of clearances in two or three years subsequent to the agreement, the Seventh Finance Commission found that it had never reached that level and by 1977-78 it had dropped from 8.66 in 1973-74 to 6.82. The ratio between basic including special and regulatory auxillary duties and additional excise duty was also higher than 2 : 1 as provided in the agreement. Significantly, when the commission confronted the finance ministry officials with the complaint of the states, it was argued by them that fulfilment of both conditions would have implied a substantial increase in the rates of duties and it might not have been feasible to do so in the then prevailing conditions particularly during the acute inflation. Similar conditions prevail today perhaps in a more acute form. The experience of the states in the past can be repeated. Instead of seeking to switch over to the scheme of additional excise duty, New Delhi could as well draw, in consultation with the states, a model sales tax law which would cause the least hardship to business and industry and remove their complaints. This would ensure that the states are not deprived of their most flexible source of revenue.

Fresh burden on jute industry?

THERE are two views on the propriety of raising the statutory minimum of raw jute prices to Rs 175 per quintal which gives a jump of Rs 15 in a single year. One is that the increase is only symbolic. The grower has little chance of getting the benefit of this rise for there is still a chain of middlemen between him and the price support machinery called the Jute Corporation of India. Despite its best intentions the corporation has not been able to build up an infrastructure in terms of field staff and co-operatives that can help it to make purchases from the growers direct. The other view is that the increase of Rs 15 in a single year, though based on the recommendations of the Agricultural Prices Commission, has not taken the realities of the situation into account.

The statutory minimum for the grade (W-5) also acts as a reference price for the Jute Commissioner to fix rates for other grades, superior and inferior, and he has already done so for all other varieties. With the transport cost thrown in, the minimum average for the Calcutta market works out to Rs 240 a quintal, an extra Rs 22.5 for the jute mills to pay over the last year's cost. The jute mills which are already complaining of losing Rs 1,000 per tonne on an average or losing something of that heavy order on the basis of costs and prices prevailing before this year raw jute minimum price was announced, feel quite alarmed at the prospect of further additions to their costs. According to an industry estimate the recent series of price increase for the fibre will add on an average Rs 250 to the cost of making a tonne of jute goods and they will have to charge at least Rs 500 per 100 B Twill bags and Rs 190 for each 100 yards of hessian—prices which may be too high under the present market conditions. At the same time with the policy of credit restraint that the monetary authorities are pursuing the mills would not have enough funds to buy raw jute on a scale that alone can sustain the fibre price at the level that the Government desires for it through the statutory minimum.

The current year's jute crop is estimated to be a large one again though perhaps not of the previous year's order of 8.5 million bales but at least eight million bales or thereabout. A large jute crop for the fourth year in succession seems to belie the old crop cycle theory postulations of a bad crop year every three years, but large crops by themselves do not create much of a problem if, firstly, an adequate export outlet in available and, secondly, the quality of the fibre had been showing steady improvement. As neither of these has been happening and there is the additional complicating factor of a record 2.7 million bales carryover, the outlook for raw jute prices in the country remains very uncertain indeed. The real testing time will come a few months hence—between September and December to be exact—when the bulk of the crop will be arriving in the market in keeping with the progress of the harvest as well as to satisfy the cash needs of the farmer in the festive months that fall within this period. The Jute Corporation, The Reserve Bank of India and the mills will then have to do something to enable the farmer earn a remunerative price.

The problem of paying an economic price to the grower has been defying solution because the old policy of encouraging quantity production persists and nothing effective is being done to persuade the farmer to grow more and more of quality fibre. At least no organised effort worth the name has so far been made either by the industry which only keeps talking about it or by the Government which professes purely for political reasons its concern for the grower. It is true that millions of farmers' families are engaged in raw jute cultivation in the form of small-scale peasant farming and it would be a superhuman job to instruct them in better or more productive ways of cultivating jute. But many demonstration farm can be started to show the growers how intensive cultivation can benefit and the country. Funds can be had from international sources if domestic resources are not available. Bangladesh has taken money both from the World Bank and The Asian Development Bank to finance intensive jute cultivation projects. There is no reason why India cannot do the same. This country has been taking money from World Bank to fund a variety of projects. Jute can be one more. India should become a regular exporter of raw jute, however, small the quantity, and this will influence sooner or later a shift of emphasis to quality production from the purely quantitative one we have been following.

LETTER FROM KENYA

PAVAN SHARMA

Moi ends racial controversy

NAIROBI

ASIAN citizens of Kenya feel relieved of a great mental stress after President Daniel arap Moi advised those Members of Parliament who had stirred up a nation-wide racial line of thinking and demanded the Government to put the country's economy—which (according to them) was still controlled by Asians—into the hands of Africans.

The controversy had been raging in Parliament for a few weeks. At a mammoth public rally at Moi Stadium in Meru, President Moi said: "I don't need MPs who talk a lot like parrots that sing tunes they don't understand. I need MPs who are men of action... parrot-type rhetoric by some MPs was not the hallmark of leadership. MPs should concentrate more on their constituencies and stop going to Parliament to talk about issues they have not been instructed by their constituents. Members are free to raise issues concerning the development of their constituencies. But if you go now and charge that the Government did not do this or that—what have you done yourself? You go and jump around saying the economy of the country is not as it should be. Are you a leader of the *wananchi* (countrymen) in commerce?

"You can assist *wananchi*, but I don't need any person to come between me and *wananchi*. I want every *wananchi* (countryman) to know that he has his president who remembers him. If you (as an MP) do not look after *wananchi* and guide them properly, I will come to the help of *wananchi* because they are not yours. Someone pretends to talk of them as his people. If they are your people, what have you done for them? The people are the President's people. And since they are the President's people, if I see them mistreated, I go to their aid because I, as their father, am ready to go to their rescue."

Mr Moi recalled that he had promised to expose leaders who were not loyal. He said one leader had bragged about being in detention. "The only detention that was honourable for a person to boast about was that under the colonialists for fighting against colonial rule. But there is nothing for you to be proud of in talking about being detained for undermining your own Government—the Kenyatta Government. You were detained because you were seeking to incite *wananchi* so that there would be no peace—and then you come to boast that 'I am champion of the African cause'. What champion? Champion of devils?"

It may be mentioned here that all detainees were released by a presidential decree in December 1978 to mark the beginning of a new era, popularly known as *nyayo* (peace, love and unity) under the leadership of Mr Moi. Mr Martin Shikuku, MP for Butere, had been one of the detainees to be released, who recently demanded that the country's economy should be put in the hands of Africans. He is an assistant Livestock Development Minister. Mr Shikuku was supported in his stance that Africans must control Kenya's economy by Nakuri North MP, Mr Koigi Wa Wamwere. "*Wananchi* support Hon Shikuku one hundred per cent," said Mr Wamwere in Parliament amidst cheers from most members.

Mr Wamwere said: "There is a debate going on who should control the economy of the country. Even the newspapers which are run by foreigners have come forward abusing people like Shikuku because of their (people's) stand that the economy of the country should not be controlled by foreigners. It would be wrong for this House to keep quiet and let it be seen as if the control-of-the-economy issue is Shikuku's. We know that Kenya has *Wananchi* of Asian, European and African origin. But we must remember that colonialism stayed in this country for 70 years. During the colonial days, people in Kenya were divided into classes with Europeans being first class people, Asian second class and Africans the last. Those who fought for independence had a common aim that these positions should change when the country was free from colonialism.

"We want action which will give Africans the first position in this country. If you look at the population of this country, we form 98 per cent of it. Ninety-eight per cent of the people of this country are Africans and we must control 98 per cent of the economy," Mr Wamwere demanded. He said there was no way of convincing Afr cans were in forefront during th s'ruggle for independence with onl two Asians, Makhan Singh and Gam Pinto. "Africans fought to run thei economy and we don't want to see an person telling us other things. But w must correct one thing. The man controlling the economy of this country i the European," he said.

"We see only Asians because the are the people we are trying to compet with. In the real sense, the Europea is still on the top. We must mak effor's to see the economy in the hand of the Africans. I saw in a newspape today that those who have the capability will control more wealth. Thi wealth is produced by Africans. W are the farmers, cooks and we do al the work. And those saying we hav no right to control our economy ar not saying anything. It is our right t control our economy. When we speal of Asians and Europeans, we shoul not be taken as racists. If they ar *wananchi*, then let us eat together otherwise they are entirely hypocrites."

Mr Wamwere said a disease had crept into Africa which made people think that "we must depend on expatriates to develop". He said that even after many years of independence, some people felt Africans could not run their own affairs. "It is time for those who know they are Africans to say we are capable and experienced to run our own affairs. Colonialists sat on us for 70 years and that is why Africans had no experience. After independence, it is hoped Africans will be given a chance to get experience. If we keep on getting expatriates, we will never get any experience because it comes with patience," he warned.

At one stage the controversy led to a verbal clash between Mr Charles Njonjo, Constitutional and Home Affairs Minister, and Mr Shikuku. In his ruling over the control of the country's economy, Deputy Speaker, Mr Moses Kiprono arap Keino, said there must not be adverse external comment by members of anything actually said by other members during the proceedings in the House. There must also be no external discussion by members of

EDITOR'S NOTEBOOK

Vadilal Dagli

IF Indian economy is ailing, public sector is the symbol of it. Whatever is deficient in Indian society is reflected in the working of public sector units. I believe that the Finance Minister, Mr R. Venkataraman, should present to Parliament the latest unitwise working results of public sector enterprises along with the *Economic Survey*. I am glad that a step in this direction has been taken by the Finance Minister who now has decided to undertake a quarterly review of select public sector undertakings. Mr Venkataraman made this announcement at a seminar on personnel selection and appraisal systems organised by the Bureau of Public Enterprises. Mr Venkataraman made an important point in his address when he said that, while profitability should not be the sole objective of the public sector performance, capacity utilisation and comparison of cost of production with standard costing were clearly identifiable and quantifiable standards of corporate performance.

According to the latest available data, in 1979-80 there was an overall loss of Rs 75 crores in public sector units in which nearly Rs 16,500 crores are invested. Even if we were to get a return of 5 per cent, the Government should have got the profit of Rs 800 crores and not a loss of Rs 75 crores. It s true that some units are making proits and some are making losses. For nstance, during 1979-80, 100 units made a profit of about Rs 463 crores while the balance 69 units made a staggering loss of Rs 538 crores.

There may be corporations like Air ndia which may have incurred a loss s an aberration. But there are culprits ke Coal India, Indian Iron and Steel Company, Fertiliser Corporation and Heavy Engineering Corporation which re on the sick list for quite some time. That as many as 100 public sector units re making profits is a matter of great urprise because the public sector is the most bureaucratised and politicalised conomic organisation in India. It is uled by irresponsible administrative ontrols by bureaucrats in Delhi who ave no business culture. They only now how to delay. On the other hand, oliticians interfere in the smallest posble detail and this is seen from the uestions that are being asked in Parament about the public sector. There ould be a national convention that cept in regard to profitability or other ajor problems the public sector should ot be discussed in Parliament. France has a large and efficient public sector, but the French Parliament does not discuss it in detail.

If a public sector unit does not make a profit then the chairman should be sacked. But today the chairman of a public sector unit is more worried about the mood of a junior bureaucrat or a junior minister in Delhi. Recently I came across a managing director of a public sector unit. He told me that most of his time was passed in Delhi in chasing papers. He was of the view that unless the Bureau of Public Enterprises is completely divested of all powers regarding the working of the public sector units, they will continue to ail. He gave one instance. Some papers connected with industrial relations in his unit were lying with the Bureau of Public Enterprises. "How can the Bureau of Public Enterprises which has no expertise on labour problems be given powers to lord over us about a matter which makes or mars production? My factory is in a shambles because industrial relations are deteriorating because of the inefficiency of the Bureau of Public Enterprises" he said. If Mr Venkataraman is serious about the working of the public enterprises he should first liberate them and make them autonomous. In my view, this can partly be done if some public sector units are made joint sector companies so that there cannot be any excuse for bureaucrats in Delhi to interfere in the day-to-day working of these units.

★

THE conservative economic policy of Mrs Margaret Thatcher which believes in creating unemployment to curb inflation is also responsible for unprecedented racial riots in the UK. High unemployment and particularly still higher unemployment among the black population created a time-bomb which exploded in the form of racial riots. Her ministers warned her about the coming crisis. The former Conservative Prime Minister, Mr Edward Heath, who is one of the outspoken critics of Mrs Thatcher's policy, recently warned: "If you have half a million young people hanging around on the streets all day you will have a massive increase in juvenile crime. Of course, you will get racial tension when you have young blacks with less chance of getting jobs". While the economic situation was grim for the black, the attitude of police was positively hostile towards the black citizens of UK. Out of about 25,000 policemen in London only 100 policemen are blacks. In Liverpool which was also rocked by racial riots, there were four black policemen out of a total police force of 5,000.

★

POLAND recently gave a royal reception to its most outstanding poet Czeslaw Milosz who returned to Poland after 30 years of self-imposed exile. Milosz who won the Nobel Prize for Literature paid a two-week visit to his country. All of a sudden he became a national hero. His name was taboo in Poland and his poems were never published in that country. When the 69-year old poet returned to a new Poland, the Polish people showered him with uncontrollable love and affection. A member of his family explained this outburst of life which was also an expression of defiance against the totalitarian rule in these words: "Poles have a strong need for symbols at the moment, for leaders other than from the party. Hence Walesa, the Pope, Wyszynski and Milosz". Mr Milosz feels that this is in the Polish tradition. In the 18th century the Romantic poets wrote from the exile and kept the Polish language alive and nationalism burning, Mr Milosz said: "It goes back to Polish literature, this peculiar place of a Polish bard. It is a motif from the past-poets who formulated collective aspirations. The paradox is that I am a private person and I am thrown into a role that is contradictory for me."

Mr Milosz was a cultural officer in Polish embassy in Paris who cut his ties with the Communist Party and lived in Paris until 1958 and then settled permanently in the United States where he is a professor of Slavic literature at the University of California in Berkeley. He composes his poetry in Polish language only. He says "language is the only homeland". The Polish Government publishing houses have started printing his verse but not his essays, particularly a collection of his essays titled *Captive Mind* which discusses totalitarianism and which remains still banned. Milosz's verse was inscribed in a monument created in honour of the workers who died in police firing in Poland. It was not accidental that Milosz became quite friendly with the Solidarity Leader Lech Walesa. The poet was asked whether he would write about his experiences of Poland 1981. His reply was "My present goal is to survive".

Bangladesh: Economic cost of Zia-ur's assassination

From A. ZAKERIA SHIRAZI and ARSHED MAHMUD

DACCA

THE departure of President Zia-ur Rahman from the scene of Bangladesh has, at least temporarily, put the country off the development track. Though there has been no major shift from the policy initiated by the late President the concerned circles are already expressing doubts about its implementation.

The prospects of foreign aid which plays vital role in the country's development planning is also not beyond doubt. The implementation of Second Five Year Plan (SFYP) depends on the receipt of 60 to 65 per cent foreign aid.

The total outlay earmarked for the 1980-81 annual development programme (ADP, first fiscal year of the five year plan) was Taka 2,700 crores (Taka 100 is equivalent to Rs 49). But the amount was slashed to Taka 2,369 crores. This was due to the shortfall in foreign aid anticipated as well as the shortfall in mobilisation of internal resources. Other reasons being the refixation of pay for the government employees and extra payment made on import of oil after the price-hike.

However, to compensate the 1980-81 annual development programme the ADP for 1981-82 has been sized at Taka 3,150 crores registering an increase of about 27.27 per cent in total development expenditure over the last financial year. The 1981-82 ADP also may fail to achieve the target.

It is learnt that the total outlay of Taka 20,215 crores (based on 1979-80 constant prices) in the second five year draft plan is being revised to almost half the size due to the lukewarm response of the donor countries in financing the second five year plan and the hyperinflationary pressure. It is not yet clear what strategy has been adopted by the Ministry of Planning to attain the target despite downward revision of the public sector outlay in financial terms during the plan period. However, a Planning Ministry source said, "we still bank upon the donors' good wishes".

The ambitious Second Five Year Plan was launched on July 1, 1980 with a major thrust on rural development and agricultural production. This is largely because agriculture contributes about 60 per cent of the country's GDP earning, the share of industry being only 10 per cent.

The Second Plan could not be initiated just on the heel of First Plan (1973-78). As the world inflationary and recessionary conditions continued to cast doubts on the prospect of aid, it became clear before the end of the First Five Year Plan that a Second Five Year Plan could not be launched just after the end of First Plan. Besides, past commitments were too large to be matched by available resources, and, too inflexible to make a Second Five Year Plan meaningful. Taking these aspects into consideration a two year plan (1978-80) was launched with emphasis on completing as many of the on-going projects as possible within the available resources. Again the targets could not be attained due to resource constraints, both foreign and internal.

During first plan period, the GDP increased at an average annual growth rate of 4 per cent as against the plan target of 5.5 per cent. The GDP growth rate during the two year plan stood at 5.5 per cent as against the projected rate of 6.1 per cent.

The total SFYP financial outlay of Taka 25,595 crores includes gross investment and working capital requirements of Taka 20,010 crores and non-investment development outlay of Taka 5,585 crores Non-investment development outlay includes such items as subsidy on fertiliser and seeds, cost of land acquisition, interest and amortization, if any, wages and salaries of some service-oriented promotional activities, and *ad hoc* recurring expenditures of certain agencies lingering in the development budget. Gross investment of Taka 20,010 crores is to be financed by net inflow of external resources of Taka 13,880 crores (about 66 per cent and domestic savings of Taka 6.130 crores. It is to be noted that domestic savings are less than required domestic financial resources by the amount of non-investment outlay envisaged in the plan. Including the latter the amount of total domestic resources required for the plan is Taka 11,715 crores.

Significantly, following the Government's stated policy that the private sector would be given emphasis the total allocation for this sector has been estimated at Taka 5,470 crores (investment Taka 52,000 crores and non-investment Taka 270 crores). The share of private sector now stands at 22 per cent. In the first plan it was 11 per cent and in the two year plan 16 per cent.

Since the Second Five Year Plan relies heavily on foreign aid, the attitude of donor countries will materially affect it. It was expected that foreign aid comnitments at the beginning of the financial ear (July 81-June 82) would stand at hree billion US dollars. Out of the mount the consortium pledged 1.7 biiion dollars at its recent meeting in Paris. Donors are reportedly unhappy with the id utilisation position of Bangladesh. Out of 10,700 million dollars mobilised s external assistance up to 1980-81 Bangladesh utilised only 7,800 million dolars.

President Zia's death has sparked the ear that the rural institutions like *gramarkar* (village government) and youth complex created by him as the prime force of rural development will crumble. There is no leader in Bangladesh Nationalist Party (BNP) who possesses the charisma and image of President Zia to be able to unite the village people and drive them to effect any major change in rural economy and life-pattern.

President Zia, after assuming power, came to understand through extensive tours in villages that the development of the country depends mainly on rural development. He brought major changes in the approach of rural development. The initial top-down approach, a highly centralised bureaucratic planning process, was discarded. Instead a bottom-up approach was taken. In this process decentralisation of power was to be achieved step by step.

In earlier top-down approach the

Joint inspection teams for Indo-Pak border

INDIA and Pakistan are again in a state of military confrontation. Foreign press reports are predicting another war between them this winter, after an interval of ten years. Troop movements on either side of the border reinforce these fears, as do delayed reports of exchange of small arms fire in which men have been killed on both sides. The question of who fired first is almost impossible to answer, since local commanders have been authorised to return fire without awaiting permission from Army Headquarters, as was formerly the case.

While the delay inherent in seeking the permission from New Delhi or Islamabad to respond to provocations from across the border was frustrating and sometimes defeated the purpose of counter-fire, it did discourage junior officers on the spot from responding to, and occasionally initiating, border incidents. Today, a stray shot fired across, or even near, the long border stretching from Kashmir to Sind can (and is known to have) touch off increasingly heavy retaliatory fire until heavy machine-guns and artillery are ordered into action to quell the other side. It is at this stage that brigade or army headquarters learn of the clash and interven to stop it. Obviously, much less damage would be done to life and property — military as well as civil — if the delay is endured and authority to fire across the border limited to the senior officers who now have to intervene to end it.

With troops and heavy equipment deployed on either side, the danger that a stray shot or shell may ignite an all-out war cannot be ruled out. If the political leadership in New Delhi and Islamabad is also suspicious of the other's intentions, the foreign press predictions may turn out to be correct.

Fortunately, Mrs Gandhi has put an end to the most nightmarish of these war scenarios : of an Israeli-style pre-emptive attack on nuclear reactors and other equipment that can be used to fabricate nuclear weapons by the deep penetration strike jets that the air forces of both countries now possess or are in the process of acquiring. She categorically denied reports that India had embarked on a nuclear weapons programme and reiterated the national commitment to use nuclear energy only for peaceful purposes. Asked specifically whether India would change this policy if Pakistan went in for a nuclear weapons programme, the Prime Minister said : "We do not believe in the deterrence theory. I do not know how it will help if we also make nuclear weapons."

By **AJIT BHATTACHARJEA**

Such a categorical assurance, going far beyond any previous commitment, that India will not be provoked into entering the nuclear weapons race even if Pakistan is foolish enough to enter it, should block the efforts of nuclear weapons export salesmen throughout the world to inject nuclear confrontation into the subcontinent. Even General Zia-ul Haq need no longer act scared when reports of alleged Indian preparations to make nuclear weapons are placed before him. The designs of the hawks on the Indian side of the border will be equally frustrated.

While the line between nuclear and conventional weapons is distinct, it is not wide. With the threat of a nuclear war between India and Pakistan removed, therefore, the need to go in for sophisticated conventional weapons designed to destroy reactors and other specialised targets associated with nuclear weapons production also disappears. In the case of Pakistan, this would remove the justification for going in for the American F-16s that were used by the Israeli air force to destroy the Iraqi nuclear reactor being constructed near Baghdad. In the case of India, it should remove the justification for increasing the number of the recently purchased Jaguar deep penetration strike aircraft as well as for negotiating the purchase of the sophisticated mirage — 2000, which is yet to go off the ground, but is already being hawked round the world by French arms salesman anxious to exploit the fears of antagonistic governments.

The same process of de-escalating weapons systems could and should influence the purchase of the latest tanks, artillery and armoured carriers by India and Pakistan in the fear that they will be needed to counter an offensive by the other side. The same procedure could extend to limit the acquisition of naval vessels intended for use against each other.

The logical conclusion of mutual measures to end the threat of another major war in the subcontinent would be for each country to evolve a system of posting joint inspection teams at incident-prone places on the border and at the headquarters of formations set up by each country to defend itself from attacks by the other. Similar arrangements could be made at police and civil administration offices near the border. Then the de-escalation would be creditable to both sides and the huge funds India and Pakistan are spending on defence, as well as their dependence on great powers for the latest arms, could be ended. The border could then be as peaceful as that between the United States and Canada or France and Germany.

SOUTH ASIA REVIEW

meagre agricultural production that took place benefited the large and medium farmers and land owners who form the core of the village power elite and have kinship relations with the urban power group entrenched in politics, bureaucracy, commerce and industry. This investment and industry-oriented strategy assumed that the benefits of development will trickle down to the rural masses through market mechanism. But the strategy proved wrong because of distorted market situation.

In order to double food production President Zia embarked on a tough but promising canal digging programme through voluntary labour. Whether as a result of canal digging or not the food production in 1980-81 has increased significantly. It is estimated that the production (the final account yet to be prepared) will be around 150 lakh tonnes (136 lakh tonnes of rice and 14 lakh tonnes of wheat). In 1979-80 financial year the production stood at 130 lakh tonnes.

As the agriculture sector provides the major share in GDP the growth rate of the gross domestic product for the current fiscal year has been estimated at 7.6 per cent. The growth rate is 0.4 per cent higher than the projected growth rate of 7.2 for the fiscal year 1980-81. But as the projection stands now the enthusiasm that was visible in rural areas appears to be dying down after the death of Zia-ur Rahman.

The activities of *gram sarkar* and *jubo* complex are reported to have been confined to paper works. It is most unlikely that these institutions which came under heavy fire during Zia's lifetime for their alleged repressive activities in the village, can continue without its godfather. The opposition attacked the creation of these institutions saying that President Zia had been trying to perpetuate one man rule in the country.

The foreign investors are also having a second thought after the assassination of President Zia. The President who brought a semblance of political stability in the country during his tenure, succeeded in attracting foreign investors to invest in Bangladesh. He visited many industrialised countries to make the foreign investors understand that favourable investment climate prevailed in the country. To encourage the foreign investors an export processing zone (EPZ) has been created and the industrial policy liberalised. The investors appeared to have been convinced and the response was quite encouraging. Mr Jamaluddin Ahmed, the Minister for Industries, has, however, claimed that the foreign investors have not cooled off.

The prospect of external assistance is likely to wither. Though there is no immediate reaction from the donor countries, the Muslim world, particularly Saudi Arabia, is rethinking about their commitment. If this country in the days to come does not take a fundamentalist swing the Muslim countries will not show interest. This was the remark made by a high official of the external resources division of the Ministry of Finance.

From December 16, 1971 to June 30, 1980, the total amount of aid committed to Bangladesh has been of the order of 9,221.2 million dollars of which 2,143.9 million was on account of food, 3,167.8 million on commodity aid and 3,909.5 million project aid. Over the years aid commitment has changed in size and composition. Towards the end of Zia-ur Rahman's tenure Bangladesh received foreign aid in large volume as grants and soft term loans. Obviously, the country's planning, rural development, foreign aid and investment entirely depends on the political stability. A void has been created and the political scenario has taken a fluid shape. The opposition which appeared to be ineffective during Zia's time is now gaining ground. And they are demanding to revert back to the 1972 constitution which provides for the parliamentary form of government. But the ruling party is determined to stick to the presidential form. With only two months ahead for the presidential election (September 21) no major political party apart from BNP has yet confirmed its participation. In this situation only time can tell whether Bangladesh will have political stability or another phase of turbulence.

Pakistan's expansionary budget

By B. M. BHATIA

PAKISTAN Federal Government Budget for fiscal 1982 (beginning July 1, 1981) shows an overall increase in public expenditure of 14 per cent over the last year. The increase in current expenditure is 17 per cent and that under capital account 9.8 per cent. The principal increase in the current account is under "defence services" where expenditure has been jacked up from Rs 1,450 crores in the budget and Rs 1,528.4 crores in the revised estimates to Rs 1,771.2 crores which mean an increase of more than 22 per cent over the last year's budget figure under the head. The budget shows an overall deficit of Rs 927.4 crores, a part of which is proposed to be made good by raising taxes and prices of state-produced commodities. The net deficit left uncovered comes to Rs 544 crores which is to be met by borrowing from the banking system or deficit financing as it is called. The Finance Minister has justified this level of deficit financing on the ground that being less than 2 per cent of the GDP, it falls within what he regards as "safe limits from the point of view of monetary and price stability".

The current revenue receipts of the Federal Government are put at Rs 4,247 crores and current expenditure at R 3,694.3 crores. That leaves a current revenue account surplus of Rs 552.7 crores On capital account, the total receipts including the surplus available from current account for financing the Annua Development Plan (ADP) come to R 2.032 crores and the total outlay is estimated at Rs 2,959.4 crores which leave the total budget with an overall deficit o Rs 927.4 crores. The budget propose liberal pay hikes in the form of dearnes and compensatory allowances to government servants which will cost the exchequer Rs 167.3 crores. That increases th budgetary deficit to Rs 1,095 crore Against that, however, it is proposed t make an economy cut of 6 per cent o government expenditure and 2.5 per cen broad cut on the ADP. This will result i a saving of Rs 169 crores to the exchequer. It is to be noted that practicall the entire amount saved through th economy cut is going to be absorbed b the proposed increased largesse from th public exchequer to the government employees. That shows the attempt on th part of the ruling elite to keep the civ and military bureaucracy satisfied eve at the cost of expenditure on development and beneficient activities of th government.

SOUTH ASIA REVIEW

The main heads of expenditure under the current account together with their budgetary provisions for 1981-82 are : general administration, Rs 197.1 crores; defence services, Rs 1,771.2 crores; law and order, Rs 114.9 crores; subsidies, Rs 184.4 crores; and debt servicing Rs 889.3 crores. These five heads account for 85 per cent of the total current account expenditure with defence alone accounting for nearly 48 per cent of the total. The three heads of community services, social services and economic services (excluding subsidies) account for the rest of the 15 per cent of the total expenditure. The distribution of public expenditure reflects the nature of state in Pakistan : it is a military and police state rather than a welfare state which, in modern times, is considered to be the ideal form.

On the capital side of the budget, two remarkable features are the colossal dependence on foreign aid for meeting the developmental expenditure and the cuts exercised in the outlay on agriculture and industry in the ADP. Of the total capital receipts of the Federal Government in 1981-82 of Rs 2,032 crores, the share of "External Assistance" or foreign borrowing is Rs 1,420.6 crores. This means 70 per cent of the available budgetary resources for developmental expenditure are to come from foreign aid. Apart from the fact that dependence of that order on foreign resources for supply of funds for developmental purposes jeopardizes the independence of country's foreign policy, it all imposes intolerable future economic burdens on the community.

Most of the so called foreign assistance is of the nature of foreign lending to the country at concessional rates of interest. The aid, therefore, means addition to debt burden of the nation and annual debt charges. The foreign debt of the country already stands at over $ 8 billion compared to a little over $ 6 billion four years back at the time of overthrow of Bhutto. The annual debt charges of the country stand at Rs 889.3 crores at present. Repayment of foreign debt is scheduled to cost the exchequer another Rs 605.3 crores in 1981-82.

Already carrying such a heavy load of debt round its neck, a prudent government should be eschewing all further borrowing unless it were necessitated by reasons of very survival of the nation. In the present case, easy access to foreign credit made possible for it by the Afghan crisis seems to be the only reason for profligacy of public spending that the Finance Minister has indulged in. The other remarkable point to note in the budget is that amidst heavy increase in defence and other types of non-essential expenditure, the public outlay on agriculture and industry, the two main commodity production sectors of the economy, has been cut down. Thus against a provision of Rs 315.6 crores on agriculture in the 1980-81 ADP, the corresponding figure for 1981-82 is Rs 293 crores which is 9.4 per cent less than last year. In industry the cut is even more drastic, from Rs 397 crores to Rs 293 crores which means a decrease of 30.6 per cent.

It is obvious that the budget is going to be inflationary in its impact. In the first place, the heavy dose of deficit financing comes over and above 13 per cent rate of inflation already raging in the country. Secondly, the increases in the prices of essential basic consumer goods like wheat, wheat flour, sugar, lubricants oils, and cement will add to the inflationary effect of deficit financing on the general price level. Thirdly, while larger home remittances add to the foreign exchange, their general impact on domestic prices has begun to prove inflationary. This is because with a view to encouraging inflow of these remittances, several fiscal concessions and incentives have been offered. The result is that about two-third of these remittances have come to be used for import of luxury import goods. The increase in remittances in Pakistan has, therefore, continued to be accompanied with rise in consumer demand for various consumption articles and rise in prices.

For the fourth year in succession, Pakistan's economy has registered significant gains in production. The growth rate of GDP in 1980-81 was 5.7 per cent. The average annual growth rate for four years from 1977 to 1981 works out at 6.2 per cent which by any reckoning is highly impressive. The high growth rate of the economy has, however, failed to keep inflation in check. Prices have shown a steady rise over the last three years. As against 7 per cent increase in wholesale price index in nine months period from July to March in 1979-80, the rise in corresponding period of 1980-81 was 10.5 per cent which gives an average annual inflation rate of 13 per cent. This shows that the earlier relatively modest level of deficit financing was able to generate so much of extra demand pressures in the market that even over 6 per cent growth of gross domestic product proved inadequate to keep price stability. With increased amount of deficit financing and a probable slowing down of growth rate of the economy, inflation rate is bound to go up still further.

The seeming prosperity reflected in the high growth rates of the economy in the last four years, is illusory. Basically the country's economy remains weak and unbalanced. The Finance Ministry itself, through its annual *Economic Survey*, draws pointed attention to the structural weaknesses of the economy. At the end of the first chapter dealing with the state of the economy, the *Economic Survey* for 1980-81 says : "Despite high sustained growth, the economy continues to face several structural weaknesses. Agricultural yields remain low compared to many developing countries as well as our potential level. Industrial efficiency, though improved recently, falls short of satisfactory level. The saving-investment gap stands at an uncomfortable level and compels the government to seek external resources. Public finances still require high levels of external and domestic borrowing. The balance of payments deficits are high: the debt service burden is likely to grow: exports are vulnerable to rice and cotton production, imports to prices of energy and manufactures and home remittances to several extrageneous factors. Fundamental obstacles to longer term growth, such as rapid population growth and illiteracy, remain to be tackled."

One could not improve upon this summary of problems facing the Pakistan economy. The budget does nothing to correct these weaknesses or remove these imbalances, to put the economy on sounder footing and stable growth path.

Intensified search for gas and oil

From ARVIND BHANDARI

NEW DELHI

SINCE oil and gas go together as major sources of fossil energy, the notable advances made by India in gas production are a matter of gratification. The gas production in 1980-81 nearly doubled compared to that in the previous year, going up from 363 million cubic metres to 673 million cubic metres.

And now the Oil and Natural Gas Commission has added a new feather to its cap following the recent commissioning of the liquified petroleum gas plant at Uran near Bombay which will convert natural gas into LPG through a cryogenic process. At full capacity, the production of LPG will be 180,000 tonnes per year. This would mean a daily output of about 38,000 cylinders. The estimate is that 2.5 million new connections for domestic gas will be given in the next two and a half year. The LPG plant will pipe its produce to Bharat Petroleum and Hindustan Petroleum for bottling and marketing. The ONGC has plans to set up two more LPG plants at Hazira and Tapti.

• India is giving as much importance to gas as to oil. Much of Gujarat's prosperity, for instance, depends upon gas. The new chain of fertiliser factories being planned in the region will also be based on supply of gas. The gas available at the Uran terminal would go up once he South Bassein gas fields are tapped. As for the major gas fields discovered so far in the Bombay off-shore area, it is estimated that these are capable of sustaining a production of 25 million cubic metres per day for 25 to 30 years.

A significant development is that, apart from Bombay and Gujarat, hopes are arising of gas discoveries in the eastern region. Gas structures were recently discovered in Andamans and Portonovo. Possibilities of both oil and gas have emerged in West Bengal and nearby areas after the explorations of the Soviet oil expert, Professor Kalinin.

The work on oil exploration by the ONGC has, meanwhile, been gaining momentum, especially in Bombay High. The Bombay High production of oil aggregated about five million tonnes in 1980-81. It is proposed to be raised to 8.4 million tonnes during the current year. By 1984-85 the output will be 13.2 million tonnes. The authorities are confident of a further increase in production if the proposal for transfer of technology from the Compagnie Francaise Petroles, which is generally called CFP, materialises. According to latest reports, an agreement has almost been reached under which the French consultants will renew their contract for technical assistance in the development of Bombay High reservoir and its satellite structures. The earlier four-year contract between ONGC and CFP ended in April this year. The agreement envisages supply of technology for water injection, gas injection and repairing of wells. Certain criticism voiced earlier no longer holds good because the original proposal of oil sharing has been dropped.

The ONGC has chalked out an ambitious programme for oil exploration, both on-shore and off-shore. Its plans for 1981-82 include seismic surveys of 20,000 line kilometres, drilling of 20 exploratory wells and 39 assessment wells and construction of 14 new platforms. As a result of extensive drilling, the ONGC has already found new areas with rich potential. Recently oil was found in the Godavari structure. The Commission has drawn up a 350 million dollars development plan for the Godavari off-shore basin which envisages a World Bank assistance of 120 millio dollars. In fact, the ONGC has sough from the Government an additional a location of Rs 1,000 crores for th Sixth Plan period to establish a co siderably higher production potential c 19 million tonnes from the off-shor areas of the Arabian Sea. Earlier th output from Bombay High by the en of the Sixth Plan period had been pro jected at the rate of 12 million tonne per annum.

The exploration drive will gain fur ther momentum when the foreign oi companies bring in their money an technology and launch operations. Th Government has, however, slightly stag gered the exercise of selecting the com panies. The Petroleum Minister, M P. C. Sethi, recently announced that th Government would start afresh the exer cise of selecting foreign companies. A second round of talks is being held i the Petroleum Ministry by including some of the oil companies which were left out when 35 of the 67 companie were shortlisted.

Since the bids received were not as many as expected, the Government wil also re-demarcate the 32 blocks — 15 offshore and 17 onshore to make the blocks more attractive to foreign bidders. The Government, it seems, wants to add some potential oil bearing areas to those blocks which the foreign oil companies now consider unattractive.

The Government is also thinking of dividing the existing Godavari basin, a highly prospective area into two blocks —shallow and deep. The shallow block will continue to be drilled by the Oil and Natural Gas Commission and the deep block will be allotted to foreign companies. The ONGC has been finding it difficult to drill in the deep waters of Godavari due to strong ocean currents and adverse weather conditions. A well drilled offshore costs the ONGC Rs 6 crores.

The need to stagger the selection of foreign oil companies has reportedly arisen because of continuing disagreement on the question of how to share the oil find, if any. The Petroleum Ministry's position is that the foreign companies would be allowed oil-sharing with India having the option to buy their share at international prices. Evidently, some companies have lingering reservations on this score. Hence the limited number of bidders. A reliable source in the Petroleum Ministry tells me that the finalisation of selection of the foreign companies will take quite some time more.

More aid for Sri Lanka

From **DALTON DE SILVA**

COLOMBO

THE Sri Lanka Aid Group, which met in Tokyo under the aegis of the World Bank on June 30 and July 1, has pledged assistance to this country to the tune of $US 834 million.

This, the 17th meeting of the group, held under the chairmanship of World Bank vice-president David Hopper, was attended by the group's members —USA, UK, West Germany, Japan, France, Canada, Australia, Netherlands, Sweden, Denmark, Norway and Italy.

Austria, Switzerland, Belgium and India attended as observers. Representatives from aid giving agencies, the World Bank, the International Monetary Fund, the International Fund for Agricultural Development, the Asian Development Bank, the United Nations Development Programme, the Organisation of Petroleum Exporting Countries and the Kuwait Fund were also present.

Normally the Aid Group meetings are held in Paris. This is the first time it met in an Asian country.

A Finance Ministry official said that taken as a whole the aid pledged this year was slightly more than last year. This is a signal achievement for Sri Lanka as the climate for foreign aid is extremely unfavourable and the leading industrial nations hvae all drastically reduced their foreign aid budget, the official said.

The delegates at the meeting expressed their confidence in Sri Lanka's economic policies and development programme. They, however, expressed some concern about the budgetary deficit in the current account in the balance of payments, the official said. They also drew attention to the poor performance of the plantation sector, need to increase both production and exports, and the need to keep a tight control on expenditure to prevent the type of deficit that arose last year due to a flood of supplementary estimates from various ministries.

The official said that the delegates expressed satisfaction about the steps taken to prune expenditure and to keep Sri Lanka's investment programme within available resources. They also expressed the hope that effective steps would be taken to increase domestic resources by widening the tax base and increasing revenue to meet the expenditure needs of the investment programme for 1981 to 1985.

Sri Lanka's Finance and Planning Minister, Mr Ronnie de Mel, who led the country's delegation presented to the meeting the "Public Investment 1981-1985" programme.

He told the delegates that unlike in the past, Sri Lanka's need for aid this year was not to start new projects but for budgetary and balance of payments support for completing on-going programmes. It was better to complete the on-going projects as early as possible and to think of embarking on any new projects only when these projects were completed.

The Minister said that when the present Government took office in 1977, it inherited a totally run-down and stagnant economy. Unemployment was over 20 per cent of the workforce. The private sector was emasculated by a doctrinnaire approach and hamstrung by threats of nationalisation and a proliferation of quantitative, price and other meaningless, administrative controls.

There had been a good response to the policy reforms adopted by the present Government since 1977. Under these reforms the exchange rate was unified and allowed to float, most imports and payments were liberalised, price controls were dismantled and the tax structure was simplified with appropriate incentives for investment in high priority areas. Food and other subsidies, which were widespread and had been in operation for nearly three decades, were rationalised by removing them from the more affluent classes and targetting them towards the poor, while restoring market incentives.

"We have been able to build up in a relatively short period a climate of confidence in which the private sector can invest and in which the public at large is viewing the Government's policy stance as a serious attempt to move away from the past", Mr de Mel said.

Following these policy changes the economy had grown in all sectors. But factors beyond the control of the government have led to a deterioration of the economic situation.

It is a tragedy that such factors threaten to jeopardise the country's development programme which is vital to solve the pressing problems of unemployment and poverty, the Minister said. The Government was, however, determined to maintain the free and liberal economy which it had encouraged and realised that current trends in public sector finances, inflation and the balance of paments were not compatible with this goal.

Accordingly the Government had taken a number of steps to improve public sector finances and the balance of payments, the most important of which had been a curbing of public sector expenditure.

Throughout the year 1980 the Government took serious steps to adjust to the emerging situation. The prices of essential commodities like rice, flour, bread, sugar, petroleum products including kerosene and milk foods were increased.

"These were most difficult political decisions", the Minister said. "The tragedy", he said "is that the adjustment towards international prices has become for Sri Lanka a case of shooting at a moving target. Each time we take steps to adjust to increased import prices at great sacrifice to our people, we only end up facing a further increased and a further need to adjust".

The Minister said it was almost an impossible situation to live through and, as if these price movements were not harsh enough, the developed countries were beginning to erect quota barriers against Sri Lanka's relatively insignificant industrial exports.

In these circumstances the first steps towards a re-examination of the public sector investment programme were taken last year leading to a reduction and hanges in the capital budget for 1981. The new capital expenditure by Government envisaged for 1981 was a modest investment of Rs 12,041 million. Public investment in 1981 to 1985 was a greatly reduced programme with its share in GDP declining from 16.6 per cent in 1981 to 11.7 per cent in 1985.

The Finance Minister said further reductions to Government's capital expenditure did not seem feasible or desirable. Nearly 90 per cent of the items in the investment programme had some concessional aid in them.

Panchayat opponents asked to join mainstream

By **BRAHMANAND MISHRA**

IN course of his address from the throne to the Rashtriya Panchayat recently, King Birendra called upon his subjects to forget petty interests and narrow outlook and join the mainstream of the partyless panchayat system which he described as a broad-based democratic system. This was the first address of the Nepalese King to the House comprising members directly elected by the people couple of weeks ago in general elections. The King spelt out in detail his government's programmes for the new fiscal year starting this month, and expressed his hope that the political stability achieved with the installation of responsible government would help mobilise the manpower and resources of the country for national development and reconstruction.

The major portion of King Birendra's speech was devoted to the steps his Government would take to improve the economic condition of the country. He said: "Our new steps towards strengthening democracy will be meaningful only when the economic development of the country for the welfare of entire Nepalese people is achieved". He appealed for unity to achieve this "noble task".

Referring to the present economic scene, King Birendra said that decline in agricultural production, deficit in foreign trade and increase in monetary circulation in the past few years had undesirable effects on the general condition of the people. However, the gross national product had increased during the current fiscal year and the increase in food production was a matter of "satisfaction". He went on to add that many problems still confronted the country and there was no alternative to achieving self-reliance.

Launching of a concrete economic programme, "as a campaign", making tax assessment simple and scientific, taking steps to increase food production, utilisation of huge water resources and launching programmes to stabilise market prices and ensure supply of consumer goods and construction materials were some of the steps King Birendra listed which his Government would be taking to improve the economic situation.

In this context, King Birendra also referred to the new industrial policy outlined recently to encourage the private sector by making the atmosphere for industrial investment more congenial, simple and favourable. Participation of foreign investment and the private sector will be encouraged for ensuring self-sufficiency in consumer goods and construction materials and in the establishment of import substitution and export promotion industries.

It was widely appreciated that the Prime Minister, Mr Surya Bahadur Thapa, at the first opportunity said that it would be his Government's endeavour to bring into the mainstream those outside the partyless panchayat system. It would seem that the Government would be tolerant of their activities so long as law and order was not disturbed in the country.

If what several members of the House have stated is any indication of the people's needs, the Government would have to go about with much more vigour and dedication than before. According to the members, production-oriented agricultural development programme, increased irrigational facilities, transport facilities, cottage industries, facilities for higner education, roads and bridges and horticulture development are the people's requirements.

It has been pointed out to the Government that there is widespread discontent among factory workers, peasants, teachers and people working in various services.

The Government, on its part, has shown its awareness of the magnitude of the task facing it. It has decided to tone up the administration and has created labour and social welfare and civil supplies ministries and reorganised other ministries. Soon an administrative staff college is also proposed to be set up.

Dr Yadav Prasad Pant, the Kingdom's noted economist who is now a cabinet rank minister holding the portfolios of finance, commerce and civil supplies, has brought home to the Government that development of management is *sine qua non* for social and economic progress.

It has been made amply clear that high sounding economic programme outlined by the Prime Minister needs to be translated into actual deed. "The new council of ministers bears important responsibilities. It must dedicate itself to the task of national reconstitution', an official vernacular daily, *Gorkhapatra*, has said.

Political analysts have asked how the granting of adult franchise could be successful if the partyless panchayat system was to be maintained. The Government has also been warned against sliding back to the back-to-the-village national campaign days of consensus. This has been occasioned by the uncontested election of the Chairman and the Vice-Chairman of the House and the Prime Minister. It is feared that if consensus is sought to be obtained in many matters, opposition may emerge from inside and this development may prove more dangerous than outside opposition.

According to Dr Dilli Raman Regmi, a former foreign minister, unopposed election "will only undermine democratic practice". He holds that the new Rashtriya Panchayat "will in no way be more enlightened than the old one".

But others differ from this view and regard unopposed election of the Prime Minister as a sign of wisdom, maturity and foresight on the part of member of the House. However, an elected member of the House, Dr P. C. Lohan, has said that the unopposed election "marks the beginning of a wrong political procedure".

Among the issues which the Government would be called upon to tackle immediately is the agitation by teachers which started in mid-April. Their demands include better service conditions Students too have not been pursuing their studies for more than a year.

Several analyses have been done of the elections to the Rashtriya Panchayat held on May 9. According to them, elections revealed lavish use of money and emergence of communalism, election o members on the basis of personal manifesto and that not many sought votes in the name of partyless panchayat system and that three groups of panches have emerged: official, non-official, and nominated panches.

Mr Rishikesh Shaha, a constitutional expert who has held various government posts and has represented Nepal at the United Nations, has said that in the course of his tour of the country he did not find the people enthusiastic or happy over the elections. “Communalism, regionalism and parochialism are coming to the fore because of the absence of organised public opinion, as well as a collective programme and initiative”.

He said in an interview with a weekly that he undertook a tour because, as a student of political science, he was eager to know the people's reaction to election. “It is no exaggeration to say that elections, which are organised in democratic countries as the means to enlighten the public about national issues, were held in our country just to enable individuals to complete in personal popularity for the sake of gaining position of authority”.

But whatever the views and analysis of political pundits, Mr Surya Bahadur Thapa has declared that the Government would concentrate on economic development through time-bound and other programmes.

Within days of the installation of the new government, a seminar on “current issues in Nepalese development” was organised.

However, the political issue which the adherents of the partyless panchayat system believe has been solved with the national referendum and the elections under the amended constitution to the Rashtriya Panchayat once for all, political analyst in Kathmandu feel remains wide open. Their reading of the situation is that the issue is likely to be debated with some intensity and taken to the people even in far corners of the Kingdom by the elements who do not favour partyless panchayat system and are not reconciled with the referendum result.

Some political leaders have said that the boycott call given at the time of the last general elections which brought Surya Bahadur Thapa back to power has achieved its obective. They see in the elections of unknown person to the House an open indication of people's dissatisfaction with the functioning of the partyless panchayat system.

In an interview to *Matribhumi,* a pro-Peking vernacular weekly, former Prime Minister and leader of the Nepali Congress, Mr B. P. Koirala, is reported to have said: “Our boycott has established us as alternative to the panchayat system. The general elections have seriously weakened the artificial unity of the panchayat system and opened the eyes of many honest supporters of the panchayat system. It has also exposed the powers behind individuals and groups giving out various slogans and wearing various masks”.

The weekly quoted Mr Koirala as saying “everyone must realise the deep significance of the positive role played by the boycott in the national poitics. The panchayat system is breathing its last at this moment. It will finally die through three internal contradictions:

The conflict arising within the new Rashtriya Panchayat is due to conflicts among individuals owing to absence of any party discipline, principle or central force, conflict between the palace and the Rashtriya Panchayat and the conflict continuing for the last 20 years between the losing followers of the panchayat system and the extra-panchayat democrats”.

Mr Koirala reportedly declared: “The democrats are soon going to have a major opportunity. It is, therefore, essential for us to set up an organisation to shoulder the responsibility that is coming upon us very soon.

He said: “I have urged my colleagues and supporters to work in close contact with the people and share their weal and woe. Our future programme has been formulated. We have now to carry out the role of an opposition as a responsible alternative by utilising whatever political right we enjoy at the moment”. However, the rebel Nepali Congress leader did not say what organisation he had in mind.

In a somewhat similar tone Siddhi Lal Singh, a leftist leader, is reported to have said that the success of the boycott underscored the people's resentment against the partyless panchayat system and heralded “the success of the forthcoming people's struggle”. A Sidharthnagar paper *Dainik Nirnaya,* reporting this statement, pointedly mentioned that Siddhilal did not elaborate on “the struggle”.

This is how the leaders who have decided to remain outside the National Panchayat see the situation.

Meanwhile, one of the elected members, Rupchand Bista, is reported to have said that adult franchise has played a major role in “nationalising politics” and “we believe in a system in which power is vested in the people and is used for the development of the society”. Siddhilal is not alone to think on these lines. Another elected member, Karna Prasad Heyju, has said that in the Rashtriya Panchayat he would fight for “full political rights” for the people. Mr Heyju represents Bhaktapur, a known citadel of pro-Chinese Communists.

Moi ends racial controversy

Concluded from page 154

matters which are the subject of a substantive motion and resolution in the House. A substantive matter is that which results in a definite resolution of decision of the House and does not preclude external comments on such non-substantive matters as questions and adjournment motions.

Talking on references to “paper citizens” and such other remarks which apparently refer to citizens of non-African origin, Mr Keino referred to a ruling on a similar matter made on July 11, 1967. He asked the members to look it up in the *Hansard* of that day because it was a lengthy one, but added that its conclusion was that Section 82 of the Kenya Constitution did not allow discrimination against citizens of Kenya merely because of their skins. “This ruling is still valid,” Mr Keino said, “Remember that we have all taken oath to defend the Constitution of the Republic.” He appealed for greater understanding co-operation and harmony between Parliament, the executive, the judiciary and the press.

Mr Keino gave his ruling by quoting a statement made by President Moi during the launching of the 1979-83 development plan. The President's statement outlined the major goals and aspirations set by the nation after the achievement of independence. The goals included national sovereignty, territorial integrity of the nation's political stability; national unity; civil liberty under the rule of law; and accelerated development for the benefit of all.

All this controversy raged in Parliament which has been in session since June 10. The 1981-82 budget has affected only smokers, alcoholics and motorists. Income tax will go up from next January.

Fast growing garment exports

By **ARVIND BHANDARI**

DATELINE NEW DELHI

EXPENSIVENESS of labour has induced the advanced industrialised countries to move towards areas of manufacture requiring high sophistication in technology and increasingly surrender labour-intensive industry to the developing countries. The labour-intensive garment industry has, therefore, emerged as a major line of manufacture in the Third World. For India, garments today constitute an important item of export.

The growth of India's garment exports has been phenomenal, at least in value terms. Indian garment exports increased from a paltry Rs 10 crores in 1970-71 to Rs 152 crores in 1975-76 to Rs 377 crores in 1979-80. According to the latest figures available, last year India's garment exports touched Rs 435 crores, exceeding by Rs 10 crores the target of Rs 425 crores. The target for the current year has been fixed at Rs 540 crores. Indications are that this may also be exceeded.

However, lest this should cause unwarranted self-congratulation, it is necessary to remember that the monetary improvement is not matched by increase in quantum and that the spectacular statistics are largely ascribable to rising unit value realisation following progressively higher floor prices fixed by the Ministry of Commerce. For example, shipments to quota countries in January 1981 recorded a rise of 20 per cent in value terms compared to January 1980, but the increase in quantum was only 5 per cent. Again, although garment exports to quota countries during January-May 1981 were worth Rs 211 crores as against Rs 183 crores in the corresponding period of the previous year,showing an increase of 15 per cent, there was actually a 2.7 per cent fall in the quantum of exports. The number of pieces of garment exported during the two periods fell from 6,35,13,000 to 6,22,67,000.

Conversations with various garment exporters show that, among other things, bungling, inefficiency, irregularities and a labyrinth of rules and regulations involving miles of red-tape collectively add up to a retarding factor. Instances are not uncommon of export consignments bearing specifications which are considerably different from the contents. Another emerging reason of course is the growing competition from China which is poised to make inroads into the American and EEC markets.

The performance of the garment industry in regard to fulfilment of quotas is also not uniform. There are no doubt items where the performance is more than 100 per cent. But there is a fair number of items where the quotas are not met. In 1979, for instance, the utilisation of quotas in respect of various items in different countries was as follows: United States—dresses 34%, West Germany—skirts 49%, France—ladies jackets 4%, Ireland—skirts 5%, Norway—slacks and trousers 9%. While over-utilisation of quotas in respect of various items no doubt compensates for the shortfall in respect of other items, the over-all performances in regard to quota utilisation cannot be said to buttress the Indian argument that the United States and the EEC countries should enhance quotas and lower non-tariff barriers.

The Government has revised penalty provisions for exporters who fail to utilise their quota for export of fabrics and made-ups within the stipulated period. A notification says that if the utilisation is less than 75 per cent of the total quota allotted, the exporter will be liable to forfeiture of his performance bond and earnest money deposit. This will be subject to conditions of *force majeure*, wherever they may arise.

According to Mrs Shiela Dikshit, secretary of the Garment Exports Association, difficulties in regard to quota utilisation mainly arise because of changes and fluctuations in western fashions. However, the garment export industry is, according to her, beginning to acquire greater flexibility so that it can adapt itself more satisfactorily to changing needs.

Nearly 90 per cent of the garment exported are made of cotton. For long time the main items of export wer cotton piecegoods. However, durin the late sixties and early seventies shift began towards vertical integration of the pattern of exports from finished fabrics and cloth to value added converted items, like made-up and readymade garments. The most popular Indian items in the internationa market have been dresses for ladie followed by skirts and blouses. Gent shirts have, however, suffered a decline but this has been more than made up by emergence of jackets as a major foreign exchange earner of the Indian garment industry.

Most of India's garment export have been to quota countries, which means countries that permit entry o garments on the basis of item-wise fixed quotas. Countries in this categor are the USA, EEC countries and th Nordic countries. The largest Indian garment exports are of course to th EEC. This can be seen from the direction-wise break-up of last year's exports which is as follows: EEC Rs 235 crores, USA Rs 97 crores, Nordic countries Rs 27 crores. Exports to non quota countries, prominent among which are Japan and Australia, were only Rs 75 crores.

The Indian garment industry is still way behind that of small countries like Hongkong, Taiwan and South Korea which have a long tradition in clothes manufacture. Efforts are now being made to achieve greater diversification in terms of direction of exports The Apparel Export Promotion Counci plans to send delegations to East European countries, Australia, New Zealand and the West Asian countries to intensify export promotion in those markets. Also helpful to garment exporters should be the recent government decision to extend the facilities hitherto enjoyed by units in free trade zones to all 100 per cent export-oriented units.

The Indian garment export drive would also receive fillip if fabrics of cotton and man-made fibre blends could be introduced as against almost

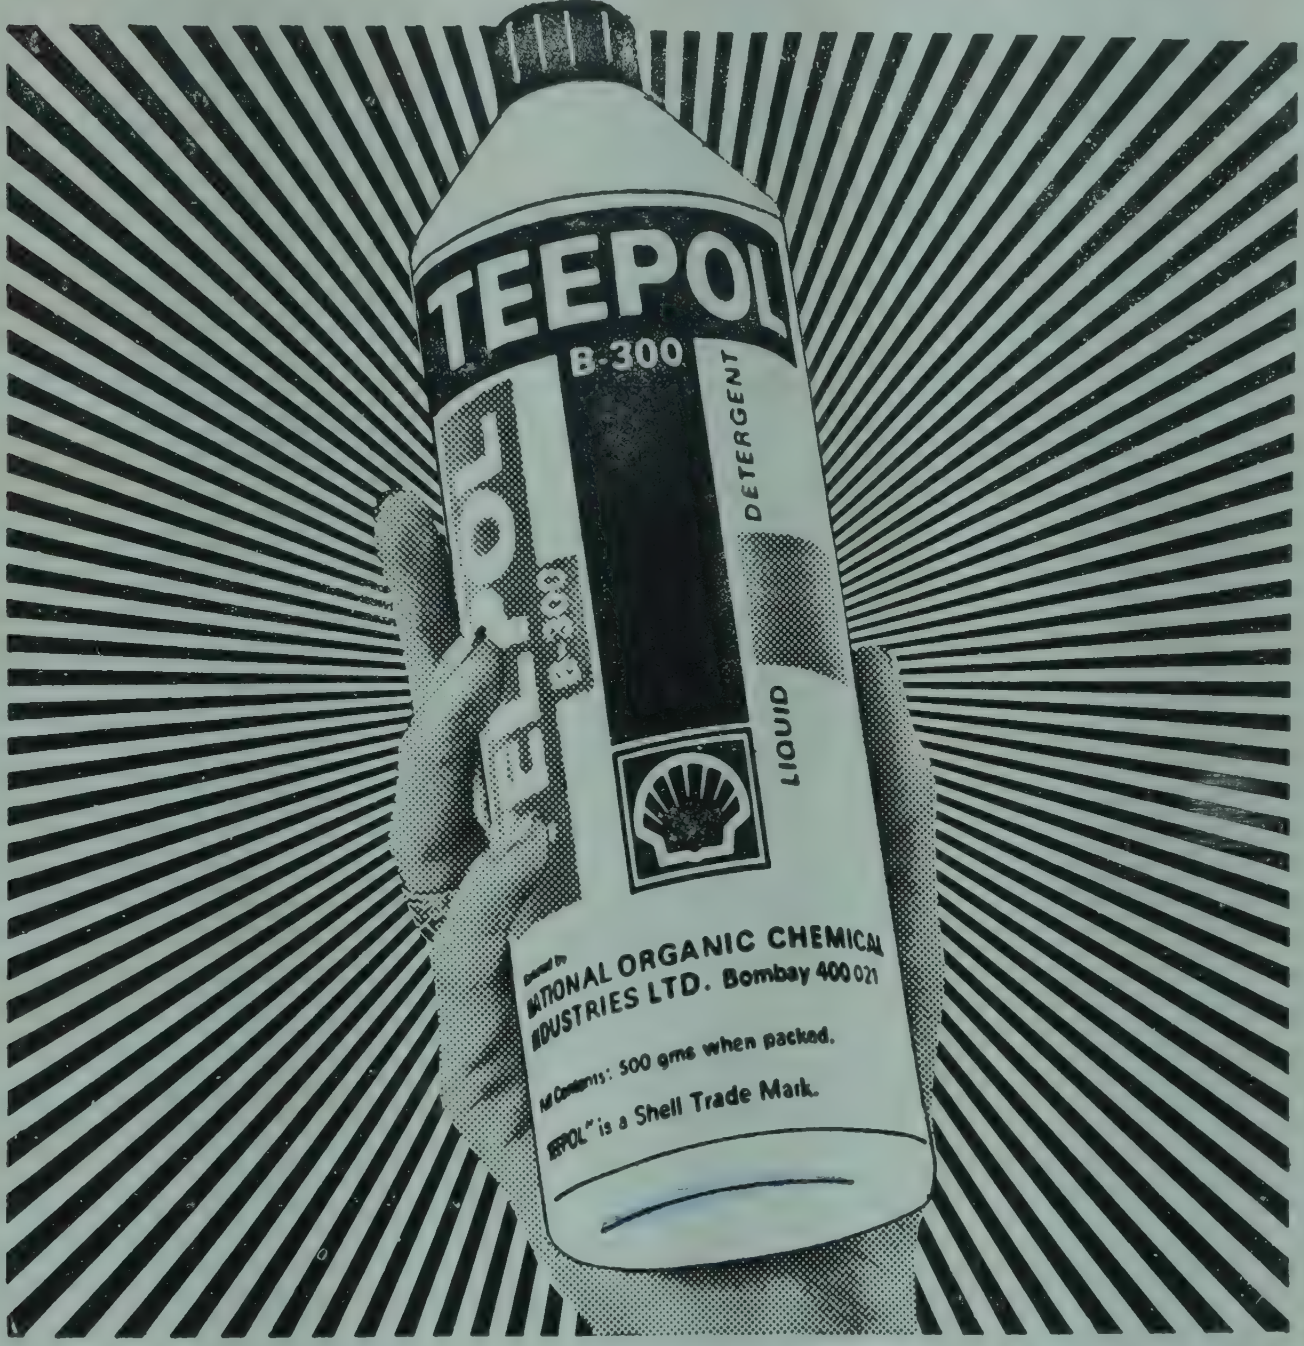
Housewives!

Here's the answer to all your cleaning problems



TEEPOL
B-300
DETERGENT
LIQUID
TEEPOL
B-300
NATIONAL ORGANIC CHEMICAL INDUSTRIES LTD. Bombay 400 021
Contents: 500 gms when packed.
"TEEPOL" is a Shell Trade Mark.

TEEPOL

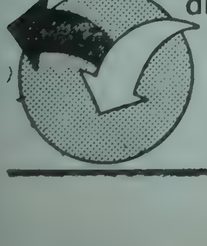
multi-purpose liquid detergent

TEEPOL—a world-class product used by women the world over

Teepol is a quality detergent formulation of Shell worldwide, which NOCIL (a Mafatlal-Shell Company) now brings to Indian housewives.

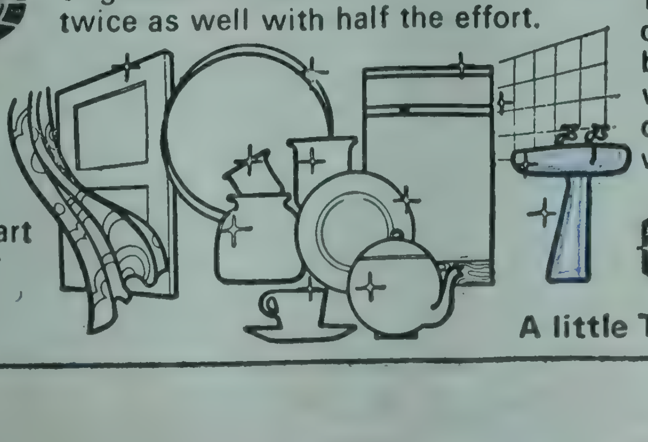
TEEPOL—drives dirt out faster

Teepol, being a liquid detergent, dissolves instantly in water. So you can start washing-up whatever you want right away.



TEEPOL—cuts grease instantly

Due to its powerful detergent action, Teepol wipes out every trace of grease. It cleans twice as well with half the effort.



TEEPOL—saves you money

Teepol is concentrated. You need to use only a little to do a great cleaning job.

TEEPOL—the versatile cleanser

It is the one liquid detergent that does the job of many. It cleans tiles, bottles, jars, windows, mirrors, woodwork, carpets, furnishings, dishes, cutlery, ovens, sanitary-ware and floors.

Marketed by:

Ours is a Magnificent Land–1

I sleep in the sewers
of my homeless cities.
But I have builded
a marbled Taj Mahal.

I hunger when famine
stalks the land.
But I have saved it
from plague and pox.

I taught my child
the arts of Science.
But I have seen him
forsake my shores.

I befoul my cities
because I will not plan.
But I have looked up
and discovered Quasars.

I see food hoarded
while my poor go hungry.
But I have made the
green revolution happen.

I never taught my children
to read nor write nor count.
But I have fathered
Nobel laureates.

I see my brother outraged
by my prejudice
But I have elevated him
to the highest office.

I flee from the farms
to the despair of my cities.
But I have held to the hope
of a hundred million jobs.

I was born to subsist
on a half-Rupee daily.
But I have died so my ashes
can enrich my loved India.

I am sad.
But I am glad.
I am.

Ours is a magnificent land.
We must build a
magnificent future. Think Ahead.

EASTERN INDIA TODAY

Improvement in industrial relations

By P. C. MAHANTI

IN the Marxist-ruled West Bengal, one would have expected the militancy of labour to increase with time, but if "Labour in West Bengal", a State Government publication, is any guide, the situation is otherwise. In fact, during the year 1980 which this publication covers, there was a remarkable improvement in industrial relations "in all its aspects".

True that the number of disputes raised fell only marginally, but that would be no more significant an index of the labour situation than work-stoppages (due to strikes or lockouts), closures, layoffs and retrenchment all of which recorded sharp declines—so sharp in fact that the falls were the lowest for a decade or so. For example, work-stoppages (number of cases, number of men involved and mandays lost) were the lowest for at least seven years, and the figure for mandays lost came down to just around 6 million from 18.4 million during the previous year—a decline of two thirds. The figure for factory closures due to industrial action was the lowest for 11 years—the number of persons retrenched was the lowest for nine years and the number of the laid-off lowest for 11 years.

Coming to absolute figures (with the previous year's relevant figures in brackets), there were 213 cases of work stoppages including 51 brought forward from the previous year (290); 50 units closed affecting 3,392 men (5,423 men —83 units); of the 50 units eight reopened with 2,016 men finding back their jobs; layoff cases involved 14,848 workmen (199 cases—65,551 workmen); retrenchment affected 1,043 persons in 91 cases (1,120 persons in 78 cases).

An analysis of the closure figures for the past decade shows that 1970 was the worst year in West Bengal in this respect, when 260 factories closed involving 71,843 workmen; 1980 happens to be the year when closures were the fewest on record—just 50, of which eight subsequently reopened, and workmen numbering only a little over 2,000 were affected ultimately. National Iron and Steel Company was one of the eight undertakings that reopened after the closure. As to the causes of the closures, it seems economic grounds like financial stringency, lack of order and market depression and shortages of raw materials were the main reasons, together accounting for over 60 per cent of the cases, but indiscipline was the single largest cause of all, accounting for some 33.7 per cent of the cases.

Big investment in Orissa

Orissa's Chief Minister, Mr J. B. Patnaik, has given details of investments in industrial development that are going to take place over the Sixth Plan in his State. He adds it up to a total of Rs 4,800 crores—of which the Central share is Rs 3,300 crores. The Central investment will come in the form of an alumina/aluminium complex (already inaugurated), an integrated coast-based steel plant and a phosphatic fertiliser plant—these three involve the whole Central outlay of Rs 3,300 crores.

Mr Patnaik takes credit for his Government's new industrial policy which, he says, has already created a favourable industrial climate in the State. This is attracting investment from outside, and already 190 medium and large industrial projects with an investment of Rs 1,000 crores have been finalised. These include a polyester staple fibre unit (Rs 40 crores), two large paper mills (nearly Rs 100 crores), nine spinning mills (nearly Rs 70 crores) and two charge chrome plants (Rs 70 crores). Some 58 of these projects with the investment of Rs 150 crores are already under implementation. While the plans for industrial development are proceeding satisfactorily, the State's agricultural output this year is a record—at a little over 6 million tonnes.

Erratic DVC

The Damodar Valley Corporation is slipping again and power generation from this very important agency in the eastern region has of late become erratic. In fact, during June the output dropped to below 400 mw from this 1,115 mw power system and the management is probably looking for excuses (scapegoats) to explain things away. Apparently, and this is the point that several observers have made, the maintenance standards at the DVC are no better than what they are in the power plants run by the West Bengal State Electricity Board. During the months that the plants were flogged to yield high generation, it was nothing but cannibalisation of machinery. Mr P. C. Luther, the chairman, who brought about that magic transformation in the functioning of the DVC power system has yet to open his mouth as to what has gone wrong so suddenly. But if the charges made against the management by some people who are obviously connected with the power plants are correct, then Mr Luther has a lot to answer for.

The officers at some of the DVC plants, it is alleged, run the units in violation of statutory rules, not on their own, but at the behest of the authorities at Calcutta. During the period March-June last, there were a series of leakages in the boiler. At Chandrapura power station, for instance, tube leaks occurred every ten days in June, as much of the work to rectify the faults of the machines concerned were left unattended in the preceding months. Engineers are being asked to operate even those units which have already developed trouble. The plants, in effect, are being run until they break down.

Plants which have already worked continuously for over a year are not being shut down for overhaul. Safety of the plant is being neglected. These are but some of the allegations that are being made. Others equally serious cannot all be dealt with here, but the ones mentioned are serious enough. They would cause headaches sooner or later to any management that chooses to overlook them. Machines without proper maintenance can work only erratically.

If the Union Ministry of Energy has decided to set up in the near future 1,100 mw power station at Mejia in Bankura district, then West Bengal need not be facing the power famine that the State Government is visualising for the State by the end of this decade. Details as to who will execute the project—the West Bengal State Electricity Board or some Central agency—are not yet available, but the design, as reported in the press, will include three 200 mw units and one of 500 mw.

As the site for a superthermal power station, Mejia is close to a large coal deposit that can fully take care of the plant's needs for decades. However, an objection raised was that the coal deposit consisted of high grade coal that can be used metallurgically, and should not be wasted in power generation. That objection is not being heard any more.

SPECIAL ARTICLES

Solar pumps for irrigation

By A SPECIAL CORRESPONDENT

THE most promising and fast-moving solar technology today is that of solar cells: flat, circular, metallic, blue chips made of highly pure silicon, that can convert sunlight directly into electricity. If only the cost of these cells can be reduced to make the cost of the electricity generated by them competitive with conventional power stations, one can imagine every rooftop plastered blue with these little metallic chips. Each house could then generate all the electricity it needs and forget about the power cuts imposed by the electricity authorities so annoyingly often without any notice.

Silicon is available in abundance in every country of the world. But the process of refining the silicon available in nature to more than 99.9 per cent purity is extremely complex and its cost extremely high. This makes solar cells 10-15 times too expensive for using them widely. As a result considerable research is now being organised all over the world to reduce the cost of manufacturing solar cells.

Indian research on solar cells, which began in the mid-70s, is without any doubt the most advanced in the Third World today. The public-sector Central Electronics Ltd. (CEL) near New Delhi is the first full-fledged plant in the Third World to manufacture solar cells. The CEL plans to produce 40-50 kw of cells this year and by 1984-85, its proposed semi-commercial pilot plant should reach its full annual production capacity of 1 mw. During the Sixth Plan (1980-85), the government plants to spend some Rs 150 million on research and development of solar cells. A sum of Rs 100 million will be spent on the construction of the semi-commercial plant, and Rs 50 million will be spent on basic research. Some twenty Indian laboratories are presently carrying out research on this field.

There is considerable optimism amongst scientists all over the world that they will be able to bring down the costs of solar cells dramatically within the next 5-10 years. Manufacturing solar cells is quite similar to manufacturing transistors. During the 1960s, as the quantity of transistors manufactured rose, their costs fell precipitously. Uptil now the falling costs of solar cells have almost paralleled the earlier experience with the transistors. With every doubling in production, their cost has dropped by about 25 per cent.

If the CEL were to go in for commercial production of solar cells today, it could manufacture them at about Rs 120 per peak watt, says Dr U. Venkateswarlu, managing director of the company. By 1985, the company expects cell costs to come down to Rs 30 per peak watt.

However, to power variety of devices that are usually installed in remote locations, and for which other energy sources are extremely difficult to provide, solar cells are already becoming competitive despite their current high costs. For instance, the Oil and Natural Gas Commission is planning to use solar cells for powering various systems on offshore platforms and buoys for ship navigation. CEL cells are being used to power the lighthouse beacon at Dwarka port in Gujarat. After the Indian National Satellite is launched, the Indian Meteorological Department plans to establish one hundred solar powered weather stations in remote locations to collect data. Similarly, the Posts and Telegraphs Department is planning to operate microwave links with solar cells. Solar-powered watches and calculators are already being sold in the market for their sheer novelty.

The total quantity of solar cells needed for such applications is small but it is enough to provide CEL with the initial market it needs to build up its production facilities despite the current high costs of the cells. However, a massive market for solar cells should open when they become cheap enough to power irrigation pumps or to produce electricity on a small scale for villages. For these mass applications, the cost of solar cells must fall to at least Rs 10-15 per peak watt.

Irrigation pumps consume an enormous amount of energy in India. Some six million irrigation pumps are operating today, of which 3.5 million are electrical pumps and 2.5 million are diesel pumps. These electrical pumps consume about 10.5 billion units of electricity every year and the diesel pumps about two million tonnes of diesel.

Cheap solar pumps would be an ideal technology for irrigating small parcels of less than two hectares of land. Irrigating less than five hectares of land with diesel pumps becomes increasingly uneconomic as land acreage decreases. Small electric pumps can be used to irrigate small parcels of land but building distribution lines to every hectare of land is prohibitively expensive. However, cheap solar cells could be easily used to power small electric pumps. India has 70 million farmers, some 50 million of whom own less than two hectares of land each. Almost all the six million pumps operating at the moment are owned by the bigger farmers possessing more than five hectares of land.

The CEL believes that the price of solar cells can be decreased to Rs 30 per peak watt by simply increasing the volume of production. To achieve further reductions in cost, it is funding several research programmes whose aims are to (a) finding new ways to reduce the manufacturing cost of the cells; (b) develop local know-how for production of highly pure solar-grade silicon; and, (c) study materials other than silicon from which more efficient and cheaper solar cells could be manufactured in the future.

Solar cells are currently produced from ingots of single crystal silicon. The single crystal is grown from pure polycrystalline silicon. The Mettur Chemical and Industrial Corporation in Tamil Nadu has with the technical assistance of the Indian Institute of Science in Bangalore set up a small laboratory-scale plant to produce pure polycrystalline silicon. This technical feat is still far from meeting the country's needs but it is an important step forward in developing local know-how to produce solar-grade silicon. It is important to develop this know-how to manufacture the new raw materials needed to produce solar cells, it cannot use them in a big way. Manufacturing solar cells from imported silicon would be somewhat similar to running an atomic power station that is dependent on imported nuclear fuel.

Researchers at the Indian Institute of Technology, Kharagpur are meanwhile trying an interesting new approach for production of solar-grade polycrystalline silicon. They are using a widely available agricultural waste–rice husks –as their starting material. Nearly one-third of the weight of rice husks is made up of silicon.

Indian scientists are thus bravely trying to keep pace with worldwide technical developments in solar cells and can only be said to be few years behind USA or West Germany at the moment. But whether this will remain so even in the future is an open question. In 1979, the solar research and promotion budget of the US government was bigger than the entire R&D budget of India. The onus, therefore, lies on the Indian government to provide adequate support to the country's solar scientists, both morally and financially. According to projection made by Mr Maheshwar Dayal, senior adviser in the Department of Science and Technology, India can aim to power all its rural industry and irrigation pumps with solar cells by the year 2000. That would indeed be a major achievement. The energy demand from these two sectors should by then be equal to some 60-80 million tonnes of coal every year: more than half the total amount of coal consumed in India today.

Alarming growth in public debt

By SUBHASH J. RELE

THERE has been a lot of comment, favourable or otherwise, from industry and trade circles on various budget proposals particularly relating to reliefs in personal income and corporate taxation but nobody seems to raise even a whimper about the staggering level of public debt reached at the end of 1980-81. The tendency to under-play the damage the ever-growing public debt can do to the economy is widespread in our country. Our policy-makers never bothered to pay any heed to the warning given by world bodies on this score. The result is that the pace of increase in debt burden has grown in recent years. Some of the defenders of public debt assert that in terms of the GNP — public debt ratio, India's position is no worse than that of the developed nations of the world. They argue that the ratio of public debt to GNP for Canada was 60; for UK 97; for Australia 58; for USA 48 and for India it was 58.

The statistics of Indian debt sound alarming. The outstanding public debt of the Government of India as revealed in recent budget papers is expected to amount to Rs 40,324.84 crores at the end of 1980-81 and is estimated at Rs 46,776.48 crores at the end of 1981-82, comprising.

	As on 31st March 1981	As on 31st March 1982 (Rs. in crores)
Internal Debt	29008.49	34459.90
External Debt	11316.35	12316.58

Internal debt

Of the total public debt-internal and external, internal debt usually accounts for 65 per cent and the balance represents external debt. 'Internal debt' comprises loans raised in open market, compensation and other bonds, and 15-year annuity certificates. It also includes borrowings of a temporary nature, *viz* treasury bills issued to Reserve Bank, state governments, commercial banks and other parties, as well as non-negotiable, non-interest bearing securities issued by the international financial institutions like the International Monetary Fund, International Bank for Reconstruction and Development, International Development Association, International Fund for Agricultural Development and the Asian Development Bank. In addition, the Government is liable to repay the outstandings against the various small savings schemes, provident funds, deposits under the special deposit schemes and income tax annuity deposit schemes, depreciation and other interest bearing reserve funds of departments like Railways and Posts and Telegraphs and certain other deposits like deposits of income-tax, super-tax, etc deposits of local funds and civil deposits.

The public debt outstanding at the beginning of the first Five-Year Plan (1950-51) was of the order of Rs 2,565.40 crores. It was doubled in a decade's time and stood at Rs 6,244.24 crores at the close of 1960-61. After this the increase has been sharper and at the end of 1977-78, it touched a figure of Rs 40,900.36 crores. The debts of state governments to the Centre had increased more than hundred-fold in the last 25 years. At the end of 1947-48, they aggregated to Rs 62 crores. Loans to the states now account for more than half of the total outlay of the Central Government. The increase in the State Governments' debts was due to the large assistance provided by the Centre to them year after year for their development outlays, leading to the creation of capital assets and for meeting non-Plan needs. States find it easy and convenient to go in debts at the drop of a hat, by resorting to overdrafts. This must stop once and for all. The Centre and the state governments can ignore the danger signals at their own peril. All this is not an argument for defeatism but a plea that a difficult problem should be faced squarely so that credible remedies can be devised.

Foreign exchange reserves

Much noise was made in the past over the accumulated foreign exchange reserves in government kitty. It has been realised that the trumpet of achievement on this score was blown too loud and too long. This was unfortunate for it encouraged complacency when the need was to put accumulated reserves to productive use. In 1978-79, our foreign exchange reserves, excluding gold and SDRs rose by Rs 927 crores without taking into account the transactions with the International Monetary Fund. This growth represented a substantial slackening from the rate of growth in previous two years. In the year 1979-80, however, there was a decline of Rs 56 crores and the declining trend has continued in the current year. By May 30, 1980 foreign exchange reserves (excluding gold and SDRs) showed a decline of Rs 274 crores from the start of the year, as against a rise of Rs 282 crores in the corresponding period of 1979-80. The slow-down in reserve growth can be attributed to a levelling off in the rate of remittances by Indian expatriates, whose numbers abroad is now believe to be rising far less rapidly than in recent past. Some part of the decline can be traced to the fall in the rupee value of foreign exchange assets held in the form of US dollars.

External debt

Internal public debt is owed by the Government to its own citizens while the obligations of external debt is to other governments. The increase in external debt, which was just one per cent during the First Plan, rose to 28 per cent during the Second Plan and 66 per cent during the subsequent plans. According to one study, in two decades of planning from 1951-52 to 1970-71, external debt accounted for 55 per cent of the increase in government's indebtedness, both internal and external. Net external assistance received by India has been declining since 1976-77. From Rs 1,154 crores in 1975-76, it declined to Rs 844 crores in 1976-77, to Rs 469 crores in 1977-78, and further to Rs 384 crores in 1978-79. It picked up slightly to Rs 483 crores in 1979-

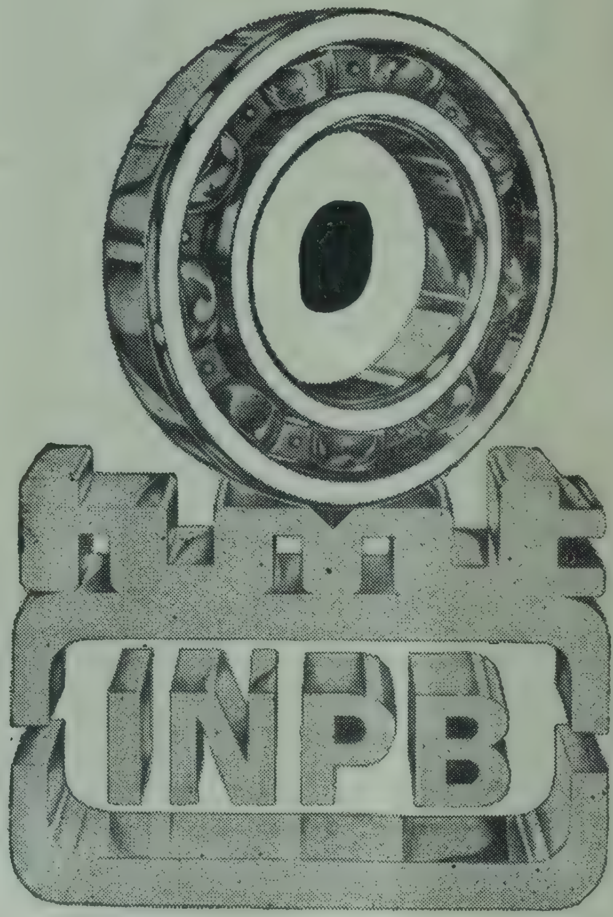
Mr Rele is editor of Industrial Times.

The plus that minuses all bearing problems.

HMT + INPB.
The sum total which has proved greater than the parts. The team-up which solved Bajaj Tempo's bearing problem when it exclusively developed and produced a special bearing which no other Indian bearing manufacturer could make and which Bajaj Tempo had to import.



The team-up which solved the army's bearing problem when it exclusively designed and developed a 120 mm. bearing for its 'Nissan' and 'Shaktiman' trucks and 'Jonga' jeeps. Bearings that were being imported till then.

This team-up between HMT and INPB has been one of the best things that has happened to the bearing industry in India. While INPB contributed its innovative capability and quality consciousness, HMT contributed its marketing, administrative and financial expertise alongwith its vast technological experience.

HMT and INPB offer not just answers to the most challenging problems in bearing design and development, but also satisfactory delivery schedules, distribution and service. Whether you need a special bearing or a regular bearing from our wide range of ball and roller bearings, HMT and INPB will solve all your bearing problems.

The future in bearings is with us.

hmt
INPB
Indo-Nippon Precision Bearings Ltd.
(A subsidiary of HMT Ltd.)

Rediffusion/IN/1463 a

80. The share of imports, financed by net external assistance continued to decline from 22 per cent in 1975-76, to less than 8 per cent in 1977-78, and to less than 6 per cent in each of the years 1978-79 and 1979-80. The low percentage in 1978-79 and 1979-80 reflects the dominance of oil bill in the total imports.

In consonance with the rising pace of public debt, the service charges also increase. Debt service payments comprising amortisation and interest amounted to Rs 884 crores in 1979-80, which were marginally more than Rs 882 crores for 1978-79. At this level, debt service payments in 1979-80 siphoned off as much as 65 per cent of gross aid receipts. The *Economic Survey* 1980-81 has pointed out that "to retain a measure of flexibility, it is, important that the foreign exchange reserves are not allowed to go down substantially. This would imply an external financing strategy which ensures that essential imports needed by the economy, especially those for development, are not constrained, cost of borrowed funds from abroad is minimised and debt servicing obligations are kept within prudent limits".

The only silver lining is that of late, there has been a gradual softening of the terms of assistance offered by individual donor countries. The assistance from the UK, Sweden and EEC continues to be mainly in the form of grants. The balance of payments situation will remain under pressure in the coming years. It will be naive to expect any significant growth in the net surplus on invisibles in the coming years. The growth in foreign remittances had already levelled off in 1978-79 and in view of the considerable uncertainties regarding ability of the Gulf countries to absorb more labour, a continued growth under this head cannot be expected. Interest earnings from reserves will also decline in the future. These considerations point to continued difficulties on the external payment front for some years to come. The alarming increase in the public debt compounds the already complex problem.

A 100-fold inrease in government indebtedness is quite alarming, to say the least, even though it is conceded that the rise in prices during the plan period has considerably reduced the magnitude of the real interest burden on these debts. The only consolation, if it can be called so, is that the great bulk of our public debt is internally held. This implies that the debt does in no way alter the wealth of the nation. This, however, ignores the other very serious implications of higher and growing public debt on the future generations.

Public issue: Applicants' woes

SIR,—During the first fortnight of April 1981 a series of advertisements were inserted in the major newspapers by the management of Vam Organic Chemicals Ltd. These advertisements proclaimed that the company has secured technical collaboration with the internationally famous Swedish firm of Bofors and assured that the public that an investment in their shares would be worthwhile. On April 10, 1981, the *Times of India* carried a full page advertisement which extolled the benefits that a would-be shareholder would derive by subscribing to its equity shares.

The public subscription for the equity shares opened on April 13, 1981 with so much of fanfare. Later, a small news item appeared stating that the shares were oversubscribed by 3-4 times. I happened to be one of the victims, having been hooked by the tall talk of a Swedish collaboration. I had applied for 1,500 equity shares, drawing a cheque for Rs 3,750 so as to be quite certain of at least securing a few shares in the company.

For nearly 100 days the applicants were completely in the dark in regard to the basis of allotment. Later on news reached stating that all the applicants are being allotted on a pro-rata basis. The issue of shares was being managed by A. F. Ferguson Associates, New Delhi, who had convincingly demonstrated their ineptitude by bungling in this case. I was allotted 300 equity shares but no refund has been made for the excess amount in spite of repeated reminders. After what seemed to be ages a cyclostyled letters has been received from A. F. Ferguson Associates stating that the refund order has been mailed, and at the same time regretting the inconvenience caused to the applicants! It is quite surprising that a firm like A. F. Ferguson Associates should have placed their wrong foot first in regard to a Rs 2-crore issue. The ultimate sufferers are, of course, the subscribers to the issue.

A. Venkatachari

BOMBAY

Confirmed booking by Indian Airlines

SIR,—In spite of having confirmed (OK) tickets, sometimes IAC passengers are denied a seat. They are not helpless.

First, if they get tickets through IAC central booking, they should write to all stations *en route* of the number and confirmed status of the ticket, and local address. Since an outdated model of computer is used for central reservation, there is considerable confusion in charts sent to various IAC stations. Hence, such a letter is helpful to safeguard the passenger's position.

Second, if in spite of reporting on time, a confirmed ticket is not honoured, the passenger should ask for the refusal in writing. According to a legal expert, unless there is a situation beyond control of the IAC, refusal to honour a confirmed ticket in some situations attracts provision of the Indian Penal Code against the person who has issued the ticket. If the IAC has issued the ticket, the person who has accepted payment for the ticket can be charged with cheating. A civil suit can also be filed against IAC for losses incurred as a result of missing the flight.

Third, a complaint can be made to IATA, reciting all facts. Airlines are afraid of IATA because if the carrier is at fault, it will be fined heavily. The address is: International Air Transport Association, 2,000 Peel St West, Montreal P.Q., Canada.

Generally it is not necessary to file a complaint. The very mention of IATA brings IAC to its knees.

The public should co-operate with IAC authorities where such co-operation is due, but not allow transgression of its own rights as consumers.

Assessing rural development schemes

Evaluation Studies—Bank of Baroda

Conducted by Project Monitoring and Evaluation Cell, Priority Sectors Department; Published by the Central Office of the Bank, Ballard Pier, Bombay 400 038.

The Bank of Baroda has brought out reports of evaluation studies undertaken in the areas where the rural development programmes were financed by the bank. A set of four such reports of which three are printed while the last one is mimeographed is reviewed here. The names of the reports are :

1. Minor Irrigation Schemes, Masuda, Dist Ajmer, Rajasthan.
2. Comprehensive Tribal Farm Development Scheme, Bansda, Dist Valsad, Gujarat.
3. Integrated Dairy Development Programme, Padra, Dist Baroda, Gujarat.
4. Composite Minor Irrigation Scheme, Mysore, Dist Mysore, Karnataka.

The first report (Publication No 96) about the minor irrigation scheme in Masuda analyses the impact of the scheme of wells (new as well as deepening of old wells) and pumpsets on small farmers (those covered under the subsidy programme and non-subsidy), medium and large farmers. The sample selected for the survey was 128 beneficiaries spread over 34 villages. The productivity of different types of farmers in the pre-investment and post-investment period was studied. As regards the small farmers covered under subsidy for new wells, the report observes cotton and gram registered a spectacular rise in productivity, but that the rise was not commensurate with the targets. As regards the non-subsidy small farmers, the report observes that more area has been brought under cotton, wheat, barley and other rabi crops; however, the yield levels of the rabi crops had not reached the levels expected. As regards the medium farmers it is noted that the net incremental income had gone up. In the case of the large farmers it was observed that there was improvement in cropping intensity etc, but not to the expected level.

Chapter VII gives a critical assessment of the scheme and discusses the economic effects of the programme on various types of farmers. An important suggestion made in the report was that the indigenous water lifting devices needed to be replaced. The summary at the end of the report gives the findings of the study in brief.

The second report (Publication No 98) about the comprehensive tribal farm development scheme in Bansda deals with the lift irrigation, tractor unit and godown schemes undertaken by the bank with the active support of the Sadguru Agricultural Service Society, Bansda, in three villages *viz*, Luz, Khadakiya and Lachhkadi where the population was entirely scheduled tribe. The lift irrigation scheme was meant to tap the waters of two tributaries of the Kaveri river flowing through the taluka, the tractor unit for services to beneficiaries for converting their lands into Kyari lands etc, while the godown was to be constructed at Bansda for storing 6,000 bags of agricultural produce. The Bank supplied crop loans to the beneficiaries of the lift irrigation scheme. A sample study of 27 farmers was carried out and it was observed that per hectare productivity had gone up in the post-investment period. Similarly, the small farmers had improved their capacity to create valuable assets such as house, livestock and farm implements. This was also true in case of other farmers. The study also found that bullock power was not utilised in full by the beneficiaries. It, therefore, observed that proper guidance was needed to be given to the small farmers in respect of "purchase and utilisation of bullocks for optimum number of hours to reduce the cost of maintenance and increase the rate of return". The tractor unit also needed to be expanded and converted into a full-fledged "Agro Servic Centre". The study recommended tha cost of cultivation of paddy per hectar needed to be worked out on a mor scientific basis. As regards godown a Bansda the study noted a rising trend in the volume of foodgrains handled from year to year.

The third report (Publication No 104) evaluates the integrated dairy development programme in 51 villages of Padra. The programme was undertaken by the bank under the Margina Farmers and Agricultural Labourer (MFAL) Programme in Baroda district in its capacity as lead bank. 122 beneficiaries in ten villages were selected for the study and position regarding repayment of loan was ascertained. It was found that 37 loanees had repaid the whole loan (within one and a half year as against three years) while 55 beneficiaries were regular in paying back the loan instalments. Thirty were found to be irregular in payments. The reasons for this situation were analysed during the course of the study. Tables 7 and 21 dealing with milk production efficiency and economics of milk production (buffalo *vs* cross-breed cows) are important.

The fourth report (series No. 3) deals with the composite minor irrigation scheme in Mysore. The bank provided finance of the order of Rs 3.95 lakhs to 145 farmers and landless labourers in 12 villages for various purposes. Detailed information regarding eight out of 14 farmers who were financed for creating irrigation facilities was collected during the course of the study. An important finding was that the farmers were not able to correctly tell the water level maintained in the wells during different periods and in view of the importance of the same, the suggestion is made to maintain record of water-level on a continuing basis. Table 15 gives the net income per hectare under different crops for small, medium and large farmers seperately. Table 17 presents interesting data about pre-investment and post-investment costs, income and profit per hectare and the net return per rupee of investment. In the summary (chapter 6), useful suggestions are made to improve the return on investment made by the farmers with the help of bank loan including one to seek the help of Ground

Vater Survey Department in cases vhere the water had not struck at all s also where water was inadequate, or possibility of deepening to get adequate water.

The Bank of Baroda by bringing out the reports has done a commendable job. While the first three reports are based on adequate sample and hence can be taken as applying to the total population (of beneficiaries), the same cannot be said of the last report where the sample is very small. It can at the most be treated as a case study.

D. R. Deoras

A handy guide to Sikkim

Splendour of Sikkim

By Homi J. H. Taleyarkhan

Government of India Press, Gangtok, Sikkim; 1981; *Pages* 52, *illustrated, Rs* 5.

Mr Homi J. H. Taleyarhkan, who is now Governor of Sikkim, has in this small booklet provided considerable useful information on the economy of Sikkim, where 86 per cent of the people live in rural areas. There is not one single square kilometre of flat land in Sikkim and not a quarter kilometre of straight road in the State. Because of the scarcity of flat land large industries have not come up in the State. However, there are several medium scale and small scale industrial units. Road transport is the only means of communication in the State which has no air or rail links. The problems attendant on construction of roads in Sikkim would be evident from the fact that 250 major and smaller bridges had to be constructed to build 1000 kilometres of road in Sikkim.

To promote the growth of industries the State Government has introduced various incentives: Subsidy on interest on loans taken by small and medium industries from financial institutions, subsidy to the extent of 50 per cent on actual charges for the use of power and concessions in sales-tax and subsidy of up to 50 per cent of actual expenses incurred on pre-operative processes like project report preparation, training and consultancy. There are other incentives also. The book is, however, marred by too many corrections that had to be carried out by hand. It is not explained why a book written by a Governor could not be produced in a better manner.

Village : Primary unit

AN article in *Janata* by Mr Siddharaj Dhadda discusses the problems of decentralisation of power and asks two related questions: "The first is what should be the polity, a village or a group of villages? The second question relates to the powers of the primary unit". Mr Dhadda says there now seems to be a broad agreement on the fact that political and economic power should be decentralised in order to enable the people to tackle the various problems confronting them. The present tendency of the Government to acquire more and more powers to meet the growing problems has to be reversed. Too much of centralisation of power retards or even distorts the development progress.

The article says: "Even as regards development, it is visualised at present that it will take place mainly through the administrative staff, and on the basis of plans formulated by a central authority rather than on the initiative and on the active participation of the people and on the basis of priorities determined by them as the most suitable for their needs. The outcome of centralised planning over the last thirty years is too obvious to need any comment or elaboration. If the problems of poverty, unemployment or disparities have to be tackled effectively, this cannot be done through bureaucratic developmental effort but only through the direct involvement of the people in the formulation and implementation of economic plans.

"Thus, both from the point of view of effective economic as well as political development, the primary unit has to be the village. However, a minimum requirement of population for the village can be stipulated. This minimum could be 50 families, but not more than 100 (about 250 to 500 population roughly), in order to ensure effective participation of the people. Large single villages of, say, 2,000 or more of population and the city wards could be subdivided into self-governing units for specific purposes and with specific powers.

"Coming to the question of the powers of the primary unit, here again there has to be a fundamental change in the prevalent attitude. It must be clearly understood that mere devolution of power is not decentralisation in its real and effective sense. Decentralisation means the transfer of both initiative and sanction. The paternal attitude towards decentralisation must be abandoned. People must be trusted with initiative and actual exercise of power."

THE TATA ENGINEERING & LOCOMOTIVE COMPANY LIMITED

Statement of the Chairman, Mr. S. Moolgaokar, for the year 1980-81

1980 was not an easy year, and with it came more than the usual quota of business problems and frustrations. All the more credit is, therefore, due to our employees, at every level, for achieving the targets set for the year. We have now exceeded a turnover of Rs. 600 crores and have broken all previous records of vehicle, spare part, excavator and export sales.

During the first 8 months of the year, however, the power shortage at Jamshedpur was worse than ever before and vehicle output was abysmally low. At the same time, many of the 'energy-lean' processes I had mentioned last year started coming on line. Coupled with an improvement in the actual availability of power at Jamshedpur towards the end of the year, these energy conservation measures made the power shortage less acute. The resilience with which our operations sprang back to peak performance speaks of the spirit of the Telco team. This is the source of our pride and of our optimism for the future.

The performance of our Pune plant was also excellent. With a substantial increase in vehicle production, our Pune operations filled in the gap created by power shortage at Jamshedpur. The results of the last two years have demonstrated the strength your Company has gained by building two separate factories.

In keeping with its objectives of self-reliance and growth from within, our Company has increasingly ploughed back earnings to meet the capital needed for expansion and modernisation. We shall continue to do this in greater measure. Telco has also started converting the investments it has made in plant, technology and people into improved performance. The Company's Directors have, therefore, proposed a Bonus Share Issue in the ratio of two for every five shares. Our performance will improve further from the additional plant capacity being planned and installed as this becomes fully utilised.

PRODUCTION OF CAPITAL GOODS

In my Statement last year, I had stated that the contribution from the Machine Tool and Production Engineering Divisions would grow. This year we produced in-house capital goods worth as much as Rs. 25.6 crores. In-house manufacture of such sophisticated equipment works out to be significantly cheaper than the cost of importing it and helps us fight inflation by minimising our capital expenditure. What is more important, these divisions enable us to imbibe the high technology which is necessary for improving productivity and reducing costs. They are assets whose true value is not reflected merely in the Rupee equivalence which is given to their output

FOREIGN EXCHANGE EARNINGS

Our Engineering Research Centre and our divisions for manufacturing machine tools and all types of dies give us the capability of introducing new vehicles which can meet the varying needs of our customers. Starting from the concept and design of a vehicle to manufacturing and installing the machines for producing it, our reliance on imported designs, know-how, machines and components is minimal.

Reducing the need for scarce foreign exchange is only one side of the coin. On the other lies an aggressive drive to earn foreign exchange. Telco's exports crossed Rs. 50 crores, making us the largest engineering exporters in India in the year under review. You will be pleased to learn that some of the major orders we won last year were in the face of strong competition from some of the best-known names in the international commercial vehicle industry. Unfortunately, exports are getting to be increasingly difficult. In the first place, inflation is playing havoc with the competitiveness of the prices we can offer. While we produce in an environment where there is 15-20% inflation every year, we have to sell in competition with manufacturers from countries where inflation is controlled to around 6-8% annually. Second, and by no means less serious, are the shipping and port congestion problems which exporters face. The total uncertainty and horrendous delays, which our ports inflict on exporters, lead not only to financial loss but permanent loss of credibility with major customers. Paucity of shipping space and high freight rates cost us crores in foreign exchange by way of lost business. Unless the authorities concerned take prompt measures to solve these problems, we may not be able to sustain the momentum of our export drive.

VALUE TO CUSTOMERS

Introduction of new designs as well as product and process improvements ultimately result in better value for the customer's money. After years of Research & Development effort and extensive customer feed-back from the field, we have now brought out the 1312 model which will fulfil a long-standing need in our range of commercial vehicles. Built specifically for arduous operating conditions, the 1312 is the first of a new series of vehicles which will set the standards for fuel-efficiency and low life cycle costs in the eighties.

The customer, however, needs not only a better vehicle but also prompt after-sales service and adequate spares. While the service and spare parts availability for Tata vehicles is sufficient for today's needs, we are undertaking major efforts to ensure that future requirements are met adequately.

ROAD NETWORK

After-sales service obviously cannot compensate for the inadequacy of the roads in our country. I am afraid we may soon have to face the grim situation of a vast sub-continent which has choked its economic arteries. Stagnation in road building is not surprising, considering the meagre outlays that are being earmarked for it.

The Sixth Five-Year Plan (1980-85) provides only Rs. 660 crores for national highways--a mere 0.7% of the total Central and State outlay. Compared with 1.3% originally proposed in the Fifth Plan and a little over 2% in the Fourth Plan, the trend is obvious. What is worse, several projects from the previous plan periods have yet to be completed and 38% of the meagre Sixth Plan provision is earmarked for them.

Building a total road system for the country, with roads suitably designed and maintained for the traffic they have to bear, would lead to substantial savings in fuel consumption, quite apart from the employment which is bound to be generated.

International experts wonder at the persistence with which India disregards the worldwide trend towards upgrading highways to carry heavier (and hence more fuel-efficient) vehicles. The need for inland transport is increasing so fast that, however efficient the railways become, our country will face a shortage of transport capacity. Step-motherly treatment cannot curb the growth of road transport but it can have a major impact on its efficiency. Considering oil prices today, no country can say it is too poor to afford good roads. The vastness of India only makes the argument more telling in our context.

Having mentioned fuel savings, I must reiterate another issue which I have raised year after year as being a prime means of achieving this saving. I am referring, of course, to the abolition of octroi. After years of discussion, it has been recommended at the national level to abolish octroi but the recommendation has yet to be implemented in all the States. Every month by which we delay the implementation means crores of Rupees worth of diesel (mainly paid for in precious foreign exchange) being burnt up, while vehicles wait endlessly at the pernicious octroi posts which dot our country.

BUILDING A STRONG ANCILLARY BASE

Installing additional capacity, to meet the ever-increasing demand, must go hand-in-hand with improvements in the utilisation of existing capacity. In Telco we are aware that the fullest returns have yet to materialise from the investment we have made. We are committed to extracting them. We see shortages in the availability of materials and components as a major constraint to making full use of our capacity in the future. The automobile industry is the industry of many industries. Therefore, its performance cannot be better than that of its feeder-industries. Vagaries in the timeliness and quality of supplies are becoming more frequent and more serious as the volume of our operations increases. Our attention is, therefore, focused on building strong ancillaries which will match our growth.

We possess an in-house technical expertise which enables us to give fledgling suppliers very real assistance by imparting technical know-how in the form of designs, processes and quality assurance techniques. Where necessary, we also give suppliers special equipment, toolings and inspection hardware which are not readily available in the country

The Company, however, can neither force suppliers to make the investments necessary for them to expand and upgrade technology, nor can it protect suppliers from the vicissitudes of the national infrastructure, the disruptions caused by industrial unrest and the steep cost increases they are facing. These supervening factors make a mockery of our attempts to introduce sophisticated materials planning techniques. Each year, inflation and our need to guard against the shocks of supply failures increase the amount of working capital needed to finance operations. We continue to seek ways to constrain the growth of working capital. The new on-line computer systems we are acquiring for both our Works should go a long way in helping us to monitor inventories, streamline material procurement and schedule production —prime requisites for effective management of working capital.

STABLE MANAGEMENT PLATFORM

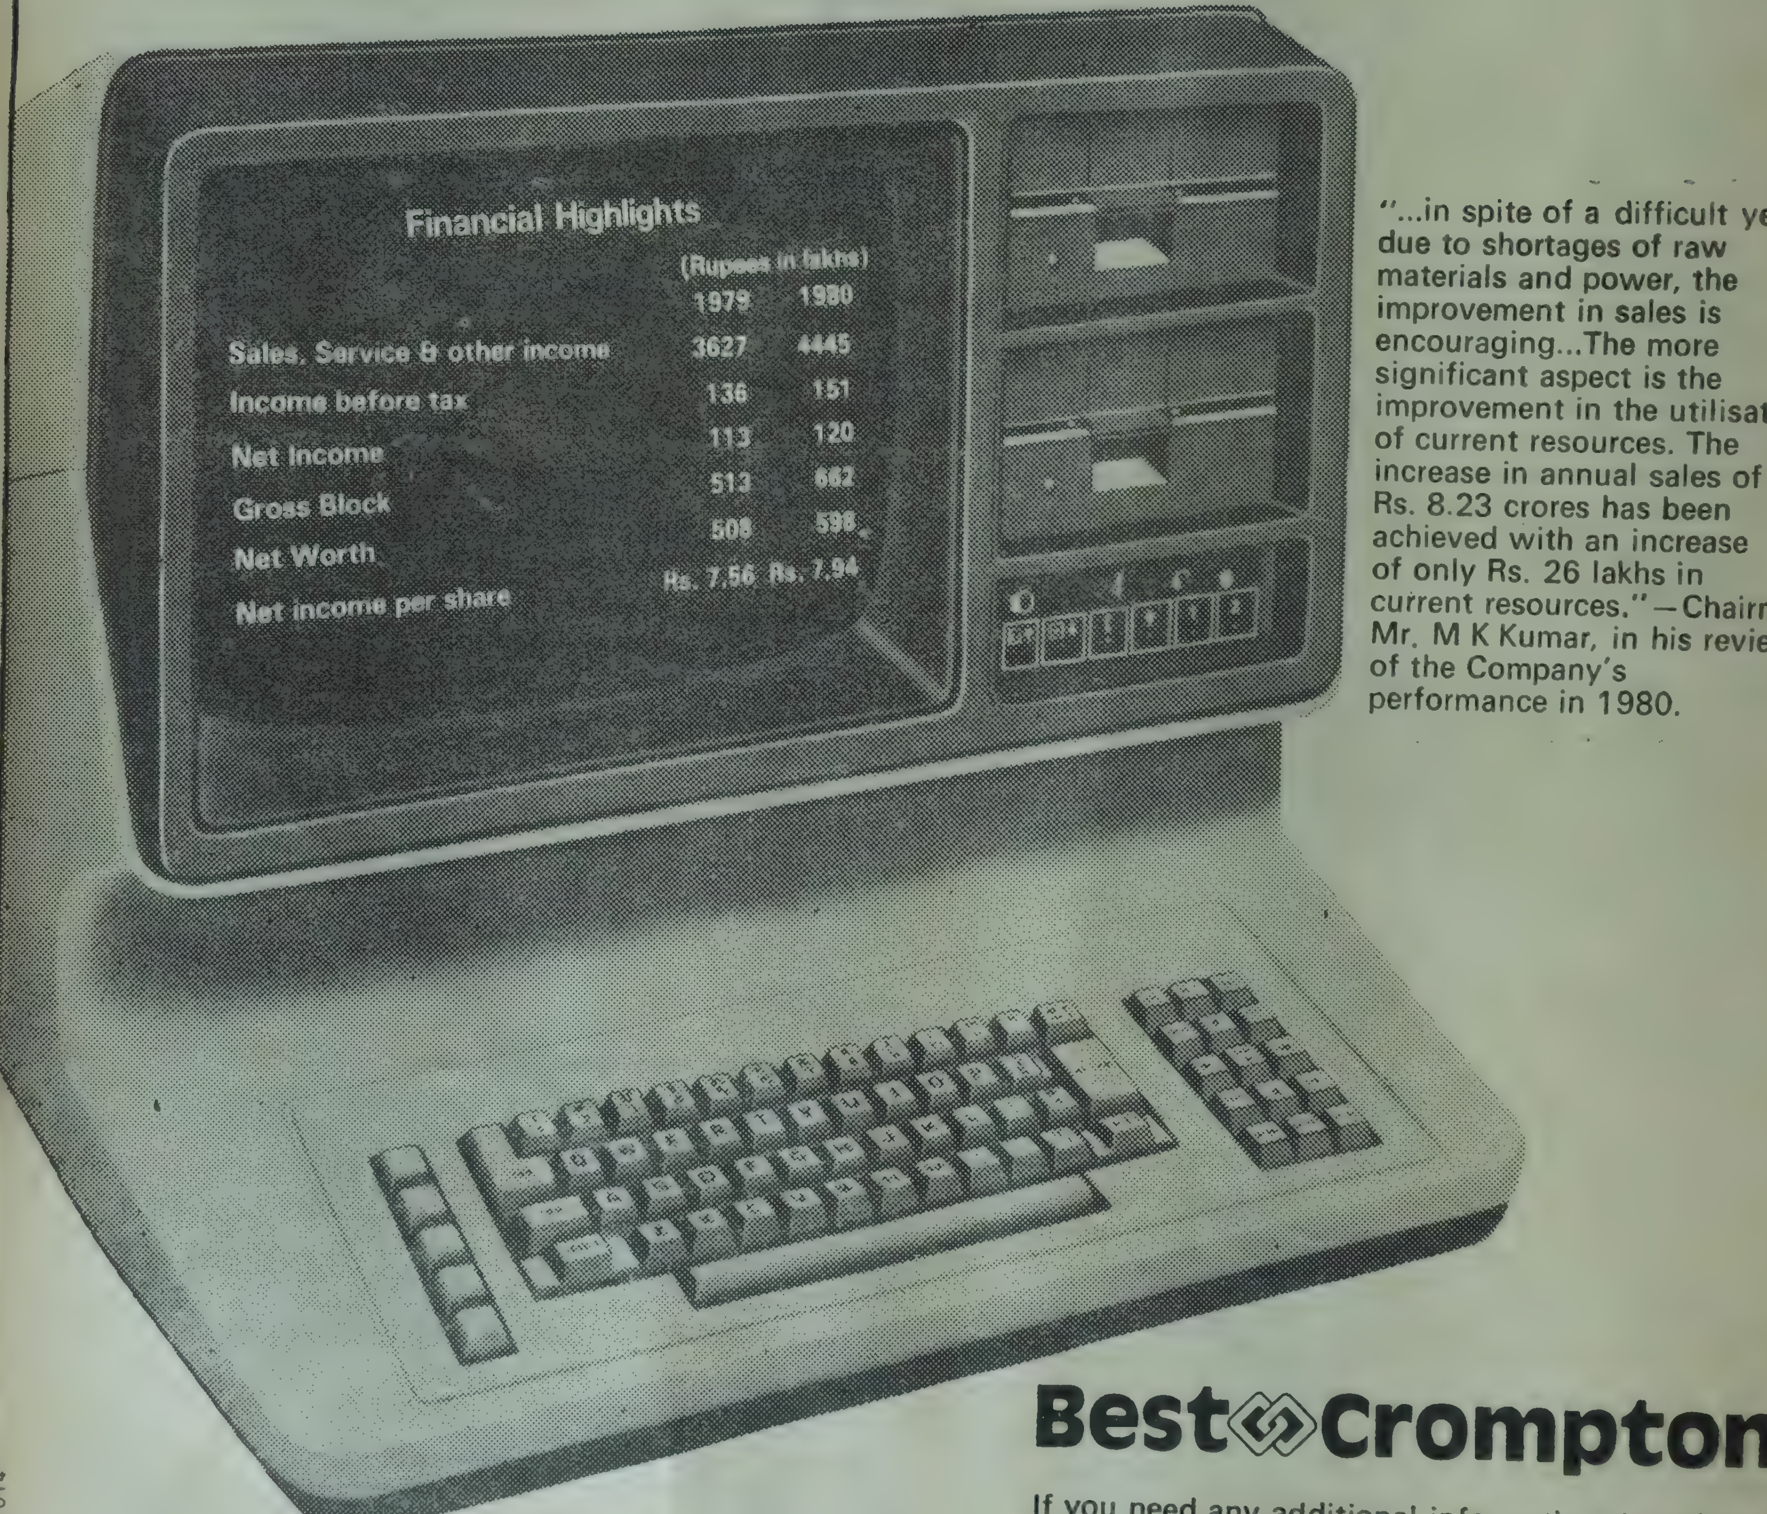
Telco now has a stable management platform which holds each of its strengths together, makes them perform in unison and provides continuity amid the changes that growth necessarily brings in its wake. Our Company has built a team which has the vision for creating the resources the organisation needs and the imagination for using these resources productively. The time and energy needed for building these resources, and indeed for building a stable management platform itself, cannot be substituted by foreign collaboration, recruitment of star performers or sudden and heavy doses of capital expenditure. Telco has spent, and is continuing to spend, time and energy on these essentials.

THANKS

The splendid response given by members of the Telco family to the call for stepping up production is apparent in the results the Company has achieved. On your behalf, I would like to thank each employee for his valuable contribution and thank the Unions for the constructive role played by them. Special mention must also be made of our suppliers who rose to the occasion and made prodigious efforts to meet our demands. To these and our other friends go our sincere thanks.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Best & Crompton: visible growth despite a year of shortages



Financial Highlights

	(Rupees in lakhs) 1979	1980
Sales, Service & other income	3627	4445
Income before tax	136	151
Net Income	113	120
Gross Block	513	662
Net Worth	508	598
Net income per share	Rs. 7.56	Rs. 7.94

"...in spite of a difficult year due to shortages of raw materials and power, the improvement in sales is encouraging...The more significant aspect is the improvement in the utilisation of current resources. The increase in annual sales of Rs. 8.23 crores has been achieved with an increase of only Rs. 26 lakhs in current resources."—Chairman Mr. M K Kumar, in his review of the Company's performance in 1980.

—A FEATURE

BANKING 1981

Changing scene : Indian banks in foreign markets and foreign banks in India

By P. C. D. NAMBIAR

THE dawn of the eighties has witnessed a sea change in the role of Indian banks in international banking. Their overseas operations, which were hitherto confined to providing remittance facilities to expatriate Indians abroad and financing India's foreign trade, have assumed a truly international character with the recent entry of some of the Indian banks into the international capital markets.

The few branches of Indian banks which were established abroad prior to India's independence in 1947 carried out the traditional functions of handling remittances of expatriates and routine foreign exchange transactions. The discernible change in the form and scope of their operations in the seventies was prompted, *inter alia*, by the following considerations :

a) To support India's multi-dimensional foreign trade;

b) assist Indian entrepreneurs who were venturing out in large numbers into foreign markets;

c) assume a developmental role by identifying untapped regions which offered a potential for the country's exports, particularly of non-traditional items;

d) serve the expatriate Indian community and induce the flow of their savings to India, for investment;

e) promote India's expertise in industrial, management and technological fields by providing financial and other assistance to Indian joint ventures securing high value construction contracts abroad and turnkey projects, through issue of bid bonds, performance guarantees, etc.

f) save foreign exchange for the country on exchange dealings by having direct access to all the important exchange markets of the world, through a branch network and getting the most competitive rates, and;

g) to earn profits, for which there is considerable scope in international operations. The keen competition among Indian banks to secure licences for opening branches abroad stems, to a large degree, from this fact.

Moving away from their traditional role averred to, their performance in recent years has amply demonstrated their international banking capabilities in mobilising resources for financing their ever expanding asset portfolios abroad as also the country's developmental projects.

Wide presence

Indian banks had, by the end of 1980, established their presence in almost all the important financial centres such as, London, Frankfurt, New York, Hongkong, Los Angeles, Tokyo, Chicago, Singapore, Bahrain, Paris and Panama. They also made an impressive entry into offshore markets in Singapore, Bahrain, Nassau, Cayman Islands, Colombo and Panama. It is creditable that most of the Indian banks have been able to operate satisfactorily despite the intense competition from multinational banks in many of these international markets. It will, of course, take quite some time for the Indian banks' share of the markets to be of some significance. A development worthy of mention in this context is the assumption of management, with or without equity participation, by Indian banks, of exchange companies and offshore banking units in the Gulf area, again testifying to the international banking capabilities and expertise acquired by them in the last few years. A few of these banks have also proved that they could make a successful entry into merchant banking activities abroad.

With a wide network of overseas offices spanning all time zones, Indian banks are now able to provide a full range of banking services. They also play an important role in raising foreign currency loans for Indian companies. Besides raising Euro-currency loans, the branches of Indian banks abroad are also active in extending loans to borrowers in third countries—at tim assuming the role of lead or co-le manager.

Being non-dollar based banks a the Indian rupee being non-convertib Indian banks have had to tap the Eur currency markets through issue Floating Rate Certificates of Depo and Floating Rate Notes, in order fund their increasing asset portfolio.

In recent times, India has resort to substantial Euro-currency borro ings, signalling a distinct shift in t country's policy in this regard. T comparatively low margins at whi the loans have been organised rais many an eyebrow, but it demonstrat without any doubt the excellent cre rating enjoyed by India in the inte national capital markets. Faced as w are with a reduced flow of internatio aid from world agencies and the wic ning gap of balance of payments de cit caused by oil price hikes, it wou become increasingly necessary to ra resources for many of the giant dev lopmental projects in this country organising syndicated loans in the for ign markets. Our total borrowings the international capital market bei negligible (about US $ 1 billion) a with an excellent track record of payments and continued political sta lity, India today commands a high c dit rating abroad and raising forei currency resources at competitive ra is not expected to create any ins mountable problems for some time come; Indian banks abroad would ha to assume greater responsibilities this area.

Untapped markets

Although the overseas expansion Indian banks has so far covered ma important international markets, th are markets with good potential Africa, South America and Austra which still remain unexploited. Giv an opportunity, Indian banks cou prove their mettle in these areas a

---

Mr Nambiar is Chairman of State Bank of India.

it is, therefore, suggested that the Indian authorities adopt a liberal licensing policy. In a situation in which many of the foreign countries are shutting their doors to foreign banks, it would be necessary for the licensing authorities in India to deal with applications expeditiously and further time should not be lost in allowing Indian banks to enter the hitherto unexploited markets abroad.

At the end of June 1980, 11 Indian commercial banks had 130 branches (including two foreign currency banking units) functioning in 25 foreign countries. Besides, there was one subsidiary of a nationalised bank with three offices operating in a foreign country.

While Indian banks have enlarged their overseas network in the past decade, owing to the selective licensing policy followed by the Government of India, foreign banks have not been able to register any appreciable increase in the number of their offices in India, although many representative offices of foreign banks have been established here in the last few years. In recent months, the Government of India has issued a few licences to foreign banks to set up offices in India, presumably on the basis of reciprocity and a few foreign banks have accordingly established their presence in India or are in the process of doing so.

Important role

Foreign banks in India continue to play an important role in financing multinationals and large corporate clients in this country. While there are some restrictions on their activities, they are generally freed of any obligation in regard to priority sector lending, except for sharing the food procurement advances.

Foreign banks function mostly at metropolitan centres and an exclusive section of business clientele tend to bank with them. They are able to fall back on the substantial support facilities and sophistication that their home offices and overseas network provide. By and large, they engage in wholesale, low risk banking, largely on a 'no funding' basis and profitability of their operations is high, compared to the Indian banking sector. Their presence provides a healthy ground for competition, both in terms of ideas and services, particularly in the field of international banking. Further, with India entering the foreign markets for raising resources for its developmental projects, foreign banks established in India would be able to find wider areas for working in co-operation with the Indian banks in such tasks. The foreign banks could also act as catalysts for investment outlets in India for petrodollars, under the scheme recently announced by the Government of India for attracting portfolio investment in selected industries which require large capital outlays. Some of the foreign banks are also particularly aggressive in the field of merchant banking and with their rich experience in this line of activity, they have contributed significantly to the Indian capital market.

International financial centre

While the present role of foreign banks in India is limited, for various reasons, the scenario would undergo a radical transformation if the proposal to establish an international finance centre in India gathers momentum and the centre becomes a reality. Such a centre would create greater opportunities for the foreign banks to offer their expertise and experience in the sophisticated field of international banking and in promoting the economic development of the country. What is visualised is a financial centre that would :—

a) provide, on an offshore basis facilities for dealing in international money and exchange and financing of international trade; and

b) assume a significant role in the Euro-currency market and generate a capital market where money instruments including bills, acceptances, certificates of deposit, bonds etc would be promoted, issued, underwritten and traded internationally.

An international finance centre in India would have added significance in a situation where Indian corporations are being granted permission to seek overseas finance for their projects and India itself enters the Euro-currency market in a big way for balance of payments reasons. With appropriate tax concessions, exchange control relaxations and regulations and improvement in communications and other infrastructural facilities, it should be possible to develop an international finance centre in a city like Bombay which could play an important role in channelising the flow of capital into India on a stable basis.

The expansion in the network of Indian banks overseas and the foreign banks in India would be conducive to our achieving a greater degree of sophistication in international banking operations and in attracting capital investments for various projects in India, both in the private and public sector

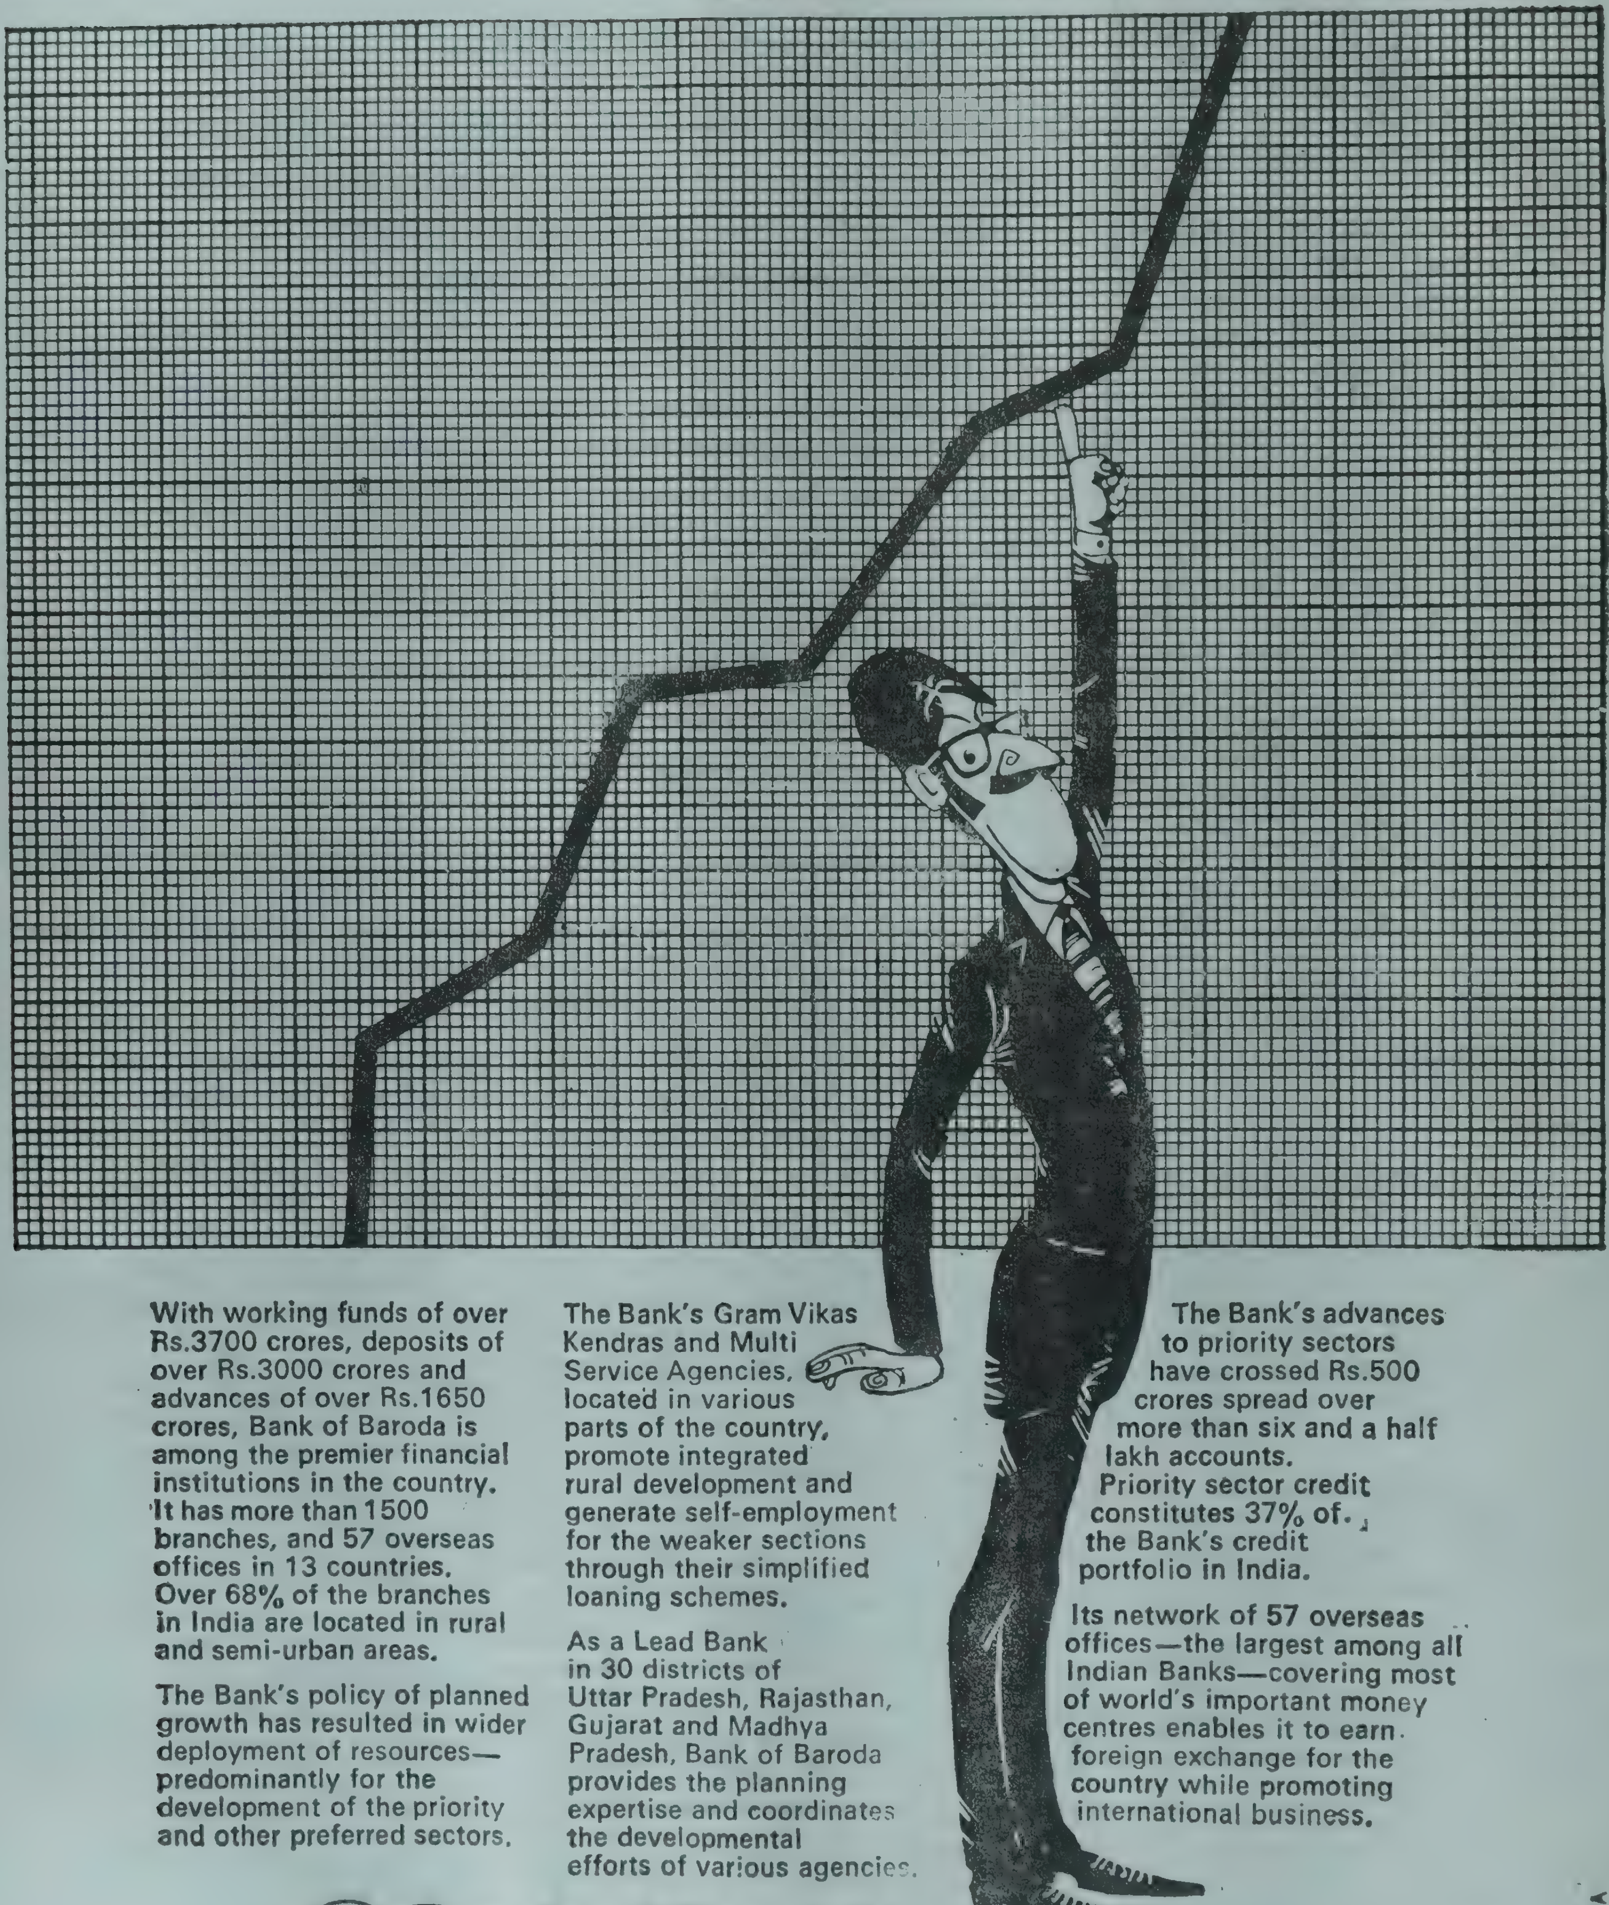
Bank of Baroda. How its growing resources help all sectors of the economy.



With working funds of over Rs.3700 crores, deposits of over Rs.3000 crores and advances of over Rs.1650 crores, Bank of Baroda is among the premier financial institutions in the country. It has more than 1500 branches, and 57 overseas offices in 13 countries. Over 68% of the branches in India are located in rural and semi-urban areas.

The Bank's policy of planned growth has resulted in wider deployment of resources—predominantly for the development of the priority and other preferred sectors.

The Bank's Gram Vikas Kendras and Multi Service Agencies, located in various parts of the country, promote integrated rural development and generate self-employment for the weaker sections through their simplified loaning schemes.

As a Lead Bank in 30 districts of Uttar Pradesh, Rajasthan, Gujarat and Madhya Pradesh, Bank of Baroda provides the planning expertise and coordinates the developmental efforts of various agencies.

The Bank's advances to priority sectors have crossed Rs.500 crores spread over more than six and a half lakh accounts. Priority sector credit constitutes 37% of the Bank's credit portfolio in India.

Its network of 57 overseas offices—the largest among all Indian Banks—covering most of world's important money centres enables it to earn foreign exchange for the country while promoting international business.

ULKA BOB-SE-2-A

Indian collaboration with finance and exchange companies abroad

By P. P. BHAT

IN the far eastern and middle eastern markets finance and exchange companies play a very dominant role in para-banking activities. That is how, at times, these companies are called merchant banks. Commercial banks in these markets are generally very big in size and hence—and even in respect of smaller commercial banks—they appear to be not interested in retail banking. The rates of exchange quoted by these companies as against commercial banks are competitive for remittances transactions, especially, for issuing demand drafts for family maintenance remittances of persons, Pakistani, Ceylonese, etc, origin settled in such markets. Another sphere in which these companies are very active is dealing in foreign currency notes, especially, US dollars, thanks to ever growing tourist traffic in these areas. Some of these companies are also equipped with well developed and sophisticated foreign exchange dealing rooms, including for gold, silver and securities dealt in international markets.

Wherever permitted by the licence issued by the monetary authority in the relative markets, these companies are also accepting deposits and lending money in deserving cases. The formalities involved for this purpose are, no doubt, more informal and rates are more competitive than the commercial banks.

Indian collaboration : In the field of setting up/managing of such financial and exchange companies, India has yet to make a headway. No doubt, laborious procedure involved in getting sanction from the authority for equity participation, is one of the hindrances, in this direction. However, when we consider that such companies are managed by western banks in places, like, Kuwait, Saudi Arabia, etc, where no fresh bank licences will be issued and such companies can be formed only with a local participation, we should be convinced that Indian financial institutions, particularly commercial banks, have not taken much interest in these matters. Let alone finance and exchange companies, several banks are managed by Pakistani personnel and the top management is drawn from Pakistani bankers who were working in Pakistan, before nationalisation of banks there. Some of these banks are quite aggressive even by western standards.

Management contracts : For the first time in the history of Indian banking, an Indian bank, entered into a collaborative agreement with a finance and exchange company in Kuwait for passing on technical know-how to that company. In other words, its dealing room would have been managed by the personnel expert dealers made available by the Indian bank. This would amount to export of expertise, which we are in a position to increase to any extent. In this venture, the bank in India, would not only not be called to subscribe to equity but also would not take losses, if any, even capital losses in initial stages. However, a fixed percentage of profits would be shared by the bank in India for rendering technical know-how. This is, no doubt, a departure from other financial and exchange companies established by some of the Indian banks, especially, State Bank of India, on equity participation basis. It appeared at one time, a good number of Indian banks were interested in such joint ventures, in the sphere of financial and exchange activities abroad, particularly, keeping in view, the stricter branch licensing policies for Indian banks abroad. However, not much headway has been made in this sphere due, perhaps, to the reported opposition of those Indian banks, who have established their own companies with local participation abroad with their own equity participation. Perhaps, these companies are not faring too well in those markets. Reasons are not far to seek. Some of the local finance and exchange companies are not only more aggressive in quoting competitive rates of exchange, etc, but also are in a position to render a quicker service to their clientele, considering that they consider finance and exchange activities to be business activities while the personnel drawn from public sector banks in India are not psychologically attuned to think of banking and financial activities as "profit making business" instead of their being merely "banking activities".

It would be a pity, if more and more banks are not encouraged to go out to render the services abroad on technical contracts. In no way these companies would take away the business from companies formed by other banks in India, since in any case business not transacted by such prospective companies will be taken away by companies managed by other nationals, especially, Pakistanis and nationals of western origin. If, more and more finance and exchange companies are allowed to function abroad, more and more inward remittances would be forthcoming through official channels only in the quickest possible time and at the most efficient rates of exchange. Even if it has to be reasoned out, there might not be substantial profits or even losses to these companies. These are borne by local parties, since we are discussing formation of such companies abroad without any equity participation.

Raising loans abroad: When the crying need of the hour is recycling of petro-dollars, especially in the field of export oriented projects and industries as well as free trade zones, Indian personnel stationed in such financial markets should be able to build up a better liaison with the intending investors abroad—Indian expatriates as well as foreigners. Most of these companies are owned by prosperous businessmen, who otherwise are carrying on with the trade and business activities all over the world as main line of their business. Such owners of these companies with their intimate knowledge of India derived out of their frequent visits to India as well as through Indian financial executives working for their own financial and exchange companies, would be in a position to bring a quite distinct dimension in increasing foreign investment in India.

Loans privately arranged : Loans for specific projects arranged by such exchange and finance companies through the good offices of local partners/owners should be still more competitive, especially smaller loans to the private sector in India, provided they fall within the exchange control regula-

---

Mr Bhat is Chairman of Forex Club India.

tions and subject to permission of local exchange control authorities in India. No doubt, India has succeeded in getting Euro-dollar loans of bigger amounts at competitive rates, but, smaller loans on behalf of private sector parties based on spread over *LIBOR* rates might be too prohibitive to negotiate. When prime rates hover around 20 per cent per annum overseas, any loans based on, say, floating rate being fixed at half yearly intervals over and above *LIBOR* would be impossible to work on long term basis, especially, in these days of high interest regime. As against this, Arabs are prepared to invest in India on lower arbitrarily decided rates of interest on a reasonably repatriable yield pattern, due to political and historical reasons, as against western sector.

Recycling of petro-dollars: Should the authorities declare some selected industries as in the case of hotels and hospitals for Arab participation, but, with an obligation to export at a higher rate, it would go a long way in solving some of the major problems involved in choosing the right industries and the right parties abroad, if such finance and exchange companies managed by Indian personnel/banks, have to take initiative, knowing as they do both local and foreign markets very well.

Joint ventures abroad: It would facilitate establishment of joint ventures of Indian origin, should these finance and exchange or investment companies act as intermediaries, especially, to obtain market information, country and commodity profiles, etc.

Needs of non-residents: These companies would also be in a position to cater to the needs of non-residents of Indian origin settled in such markets using services of such companies for their remittances back home, in giving correct information to them, especially, with regard to rules and regulations prevalent in India in respect of facilities available to non-residents whether in respect of deposits and investments or manufacturing activities and especially tax matters. Many of these non-residents, most of whom are successful technocrats are not aware of the facilities available to them if they were to settle in India and hence good opportunities are lost to our country.

If industries manufacturing for export under excise bond or in a free trade zone, and with high value added concept, involving higher percentage of exports, are to be encouraged as a result of measures enumerated above, it should definitely help the country in getting much needed relief in the sphere of fuller employment, higher productivity, conserving of exchange due to import substitution and above all, a happier balance of payment position too—thanks to invisible earnings to India, out of share of profits of such companies and earnings of Indians serving in such companies.

Euro-currency market: Opportunities for India

By SUSHEEL CHANDER

THE Euro-currency market constitutes a significant — and growing — segment of the international money and capital market. Though a relatively recent phenomenon—much of the growth of this market has taken place during the last 10 years — the Euro-currency market is today quite well spread and diversified and encompasses several markets separated by the type of transaction, geographical location, institutional arrangements and by the use of various instruments for financial dealings. Essentially, the term Euro-currency market refers to the supply, demand and availability of a particular currency at financial centres and money markets outside the 'home' country of that currency. To amplify, the Euro-dollar market refers to the market for US dollars in London, Singapore, Bahrain or any other financial centre outside the US. Likewise, the Euro-sterling market refers to the market for pound sterling outside the UK, the Euro-yen market, that for Japanese yen outside Japan and so on.

Of particular relevance and interest to us in the Indian context is that component of the Euro-currency market commonly referred to as the syndicated loan market. Within this specific market, the largest and perhaps most important element is the medium-term Euro-credit market. Conceived in the late sixties, this market developed rapidly in the seventies and is now a vital channel for the international flow of capital through the medium of term loans : typically, such loans could be for periods ranging from 5 to 8 years and 'syndicated' among banks active in international cross-border lending, the borrowers being governments, public sector agencies (parastatals) and private sector companies in both the industrialised world and in developing countries.

Roll-over credits

The size of each medium-term euro-loan varies with the nature and purpose of the borrowing. The median size could be reckoned at around $ 100 million though one does come across jumbo loans (in excess of $ 500 m) once in a while; the loan to National Aluminium Company (NALCO) for the Orissa aluminium project in the amount of $ 680 million syndicated late last year, is a case in point.

For the most part, syndicated medium-term Euro-loans are 'roll-over' credits, whose price to the borrower has three components : an interest rate fixed every 3, 6 or 12 months in line with ruling short term interest rates (usually the London inter-bank offered rate on deposits in the Euro-currency concerned, popularly referred to as *LIBOR*), a premium or spead, usually fixed for the life of the loan, though a marginal change in spread after the loan has run for some period is not uncommon; and thirdly, various fees, mostly recovered up-front. *LIBOR* represents cost of funds lent and is currently around 18 per cent per annum for 3 months deposits, 17¾ per cent per annum for 6 months deposits and 16¾ per cent per annum for 12 month deposits. The spread on loans to borrowers considered 'prime' risks is currently 3/8 per cent to ½ per cent per annum while front-end fees usually add up to around 1 per cent flat for most borrowers.

Syndicate Euro-credits are usually put together by a single bank referred to as the lead manager; for large loans a small group of two or three banks could function as the lead management group. To be appointed lead manager, the bank concerned has to win a mandate from the borrower on the basis of competitive bids. Thereafter, the lead manager or the lead management group gets to work preparing a detailed information memorandum on the borrower and on the loan in question and sends out offers, usually by telex, to international banks active in the market, inviting participations, followed up by a copy of the information memorandum to each potential participant. Based on the response to these offers (in terms of size of the participation), 'managers' and 'co-managers' are appointed by the lead manager : 'managers' and 'co-managers' are required to underwrite a prescribed minimum amount under the loan for which they are not only given a special status in the syndication but are also entitled to a larger share of the front-end fees than the other participants. Once the management group and list of participating banks are finalised, other formalities like loan documentation, drawdown and loan servicing mechanics, etc are attended to by the lead manager(s) with due expedition

Advantages

The advantages of a syndicated Euro-loan to a borrower are several:

i) *Speed*: The communication links and response systems are so geared in the market that the entire process from awarding the mandate to the drawdown of funds is completed in a matter of a few weeks. The borrower negotiates and deals only with the lead manager who, in turn, takes care of sourcing, structuring, syndicating and selling the loan to the other banks involved. The market is not closed at any time; and there are no 'listing' or registration formalities or other regulatory requirements to be met.

ii) An additional — and flexible — source of finance particularly for borrowers from developing countries, most of whom cannot tap the bond markets where listing and rating requirements can be quite exacting.

iii) Wide publicity in the international financial press through news items as well as 'tombstones' — the unfortunately sepulchral name given to advertisements that regularly appear in papers like the *Financial Times* of London, the *Wall Street Journal* etc furnishing salient details of the loans syndicated.

iv) Forging new banking relationships which could turn out to be in the borrower's long-term business interests. Trans-national companies and even sovereign states have multi-banking relationships throughout the world. A large euro-loan syndication could help strengthen existing connections and develop new relationships as well.

v) Facilitating access to other sectors of the international capital market such as the Euro-bond market where long term loans at *fixed* (and relatively low) interest rates could be raised by borrowers enjoying good ratings.

For these reasons, syndicated Euro-credits have proved to be quite popular with borrowers in the developed world as well as those in the lesser developed countries. Thus, during 1979 alone, syndicated credits totalling some $ 72 billion were arranged (publicised figure). In 1980 this figure is expected to have been close to $ 80 billion with outstanding publicised syndicated loans as of year-end 1980 amounting to around $ 250 billion Syndicated medium term Euro-currency lending has come to form a significant part of the balance sheets of international banks — a part that has been growing

---

Mr Susheel Chander is chief general manager, International Division, State Bank of India.

rapidly in the last few years. Developing countries like Brazil, South Korea, Phillipines and even oil-exporting countries like Mexico, Venezuela and Nigeria are large and regular borrowers in this market.

Yet another segment of the Euro-currency market that many developing countries tap is the short term market comprising acceptance credits (against specific international trade transactions) and outright loans for 6 to 12 month periods for financing lags in balance of trade and other deficits on current account. Here again, lending syndicates are formed, banks generally being quite eager to join as participants or managers considering that they are not exposed to the risks of maturity transformation for the most part.

Big gap

India has traditionally met most of its requirements for external funds through aid channels, government-to-government assistance, World Bank loans (including quasi-commercial loans from the IFC and soft loans through the IDA), drawings from the IMF, etc. With the deepening recession in the industrialised world, the increasing constraints and pressures on the resources of the World Bank and its affiliated institutions, particularly in the wake of the recent emergence of China as an important claimant for soft-term credit, India would have to turn increasingly to commercial sources for meeting its foreign currency requirements. These factors apart, even financial institutions in India like the IDBI, IFCI and ICICI seem to be running short of rupee resources: large business houses are in fact being exhorted to turn to commercial sources abroad for a portion of their requirements of project finance. Among these commercial sources the two most important are :

a) subsidised export credit schemes available in the UK and many European countries against shipments of capital goods; and

b) syndicated Euro-currency loans.

Again, the country's Sixth Five-Year Plan envisages gross external resource requirements (gross capital inflows as the Plan document puts it) of Rs 10,976 crores against which net foreign aid to the tune of Rs 5,889 crores has been taken into account. The resultant gap of Rs 5,087 crores has obviously to be bridged by drawing down foreign exchange reserves and through other borrowings. However, though India's exchange reserves, excluding gold and SDRs, are estimated to be around Rs 4,400 crores, the scope for drawing on these reserves is limited. The country would have to maintain reserves to cover at least 2½ months' imports which, on the basis of current trends, would work out to around Rs 2,500 crores. Thus, less than 50 per cent of the gap of Rs 5,087 crores can be met through a drawdown on reserves. But even this seems doubtful since the situation on the balance of trade front is none too comforting: the final trade figures for 1980-81, recently released, show that the balance of trade deficit would be close to Rs 5,500 crores (as against Rs 4,200 crores estimated earlier); assuming a net surplus on invisible account of Rs 2,500 crores, the deficit in the current account would be around Rs 3,000 crores which, again, would have to be met through the reserves 'cushion' of Rs 1,900 crores supported hopefully by external assistance and borrowings from the IMF beyond the conventional tranches—recent press reports indicate that a loan of US dollars 4 billion (Rs 3,200 crores) may be thus sought.

With the import bill rising rapidly year by year, exports lagging behind and the net surplus from invisible earnings more or less static, the balance of payments position is likely to come under increasing pressure over the next few years at least. Clearly, if India is to maintain the pace and tempo of economic growth and development outlines in the Sixth Plan document during the remaining three (full) years of this Plan, there seems to be no option but to go in for commercial borrowings on a larger scale than hitherto, particularly when the climate for increased assistance through official aid and through the IMF/World Bank does not seem very encouraging. And this means increasing recourse to the syndicated medium-term Euro-credit market.

Congenial climate

Notwithstanding the rather disconcerting balance of payments position just outlined, the climate for borrowings in the Euro-currency markets by the Government of India as well as companies operating in India is still quite congenial. As is well known, India entered the syndicated Euro-currency loan market in a big way last year with total borrowings close to $ 1 billion. The 'spreads' that NALCO secured on their $ 680 million, 10-year loan and ONGC on their $ 200 million, 7-year loan were comparable to what the best-rated risks could command in this market which, as is well known, is dominated by hard-nosed bankers from the world over. Indeed, the overall terms that both NALCO and ONGC secured were the envy of many countries in the developed world. Such fine terms may not be available for future borrowings in the Euro-currency market—the spread on the ONGC loan was fixed at 3/8 per cent for the first three years, thus breaking the mythical ½ per cent barrier. Even so, the country's risk rating in the market is still good, thanks to the Government's largely prudent economic policies, the encouragement given to the private sector in the accelerated programme of industrial development, self-sufficiency in food, continued political stability and, not least, the comfortable level of foreign exchange reserves and the low level of external commercial borrowings. Consequently, it has been estimated that, during the next few years, borrowings to the tune of $ 3-4 billion from the Euro-currency markets should be possible on terms favourable to us.

The need for increasing imports of capital goods and technology into India —at least on the scale envisaged in the Sixth Plan document—has never been more pressing. Although among the top ten countries in the world in terms of GNP and with the third largest pool of scientific and technical manpower, India today finds itself lagging behind newly industrialised developing countries (NIDCs) like Hongkong, Singapore, South Korea and Taiwan when it comes to a question of exports of engineering goods and electronic hardware. With a staggering balance of trade deficit of nearly Rs 5,500 crores in 1980-81, which may well be even higher during the current year, there is a paramount need to step up exports. Traditional items of export are under severe pressure either due to protectionism, sagging prices or the recession in many industrialised countries, so that it is the engineering and electronics industries that would have to play an increasingly large role in the country's exports: engineering goods exports during the current year (1981-82) are slated to rise, according to the Engineering Export Promotion Council, to Rs 1,150 crores as against Rs 900.50 crores (actual) during 1980-81 while, in the years ahead, this figure (of Rs 1,150 crores) would have to be stepped up significantly. For this, imports of foreign technology as well as machinery and equipment are both essential and urgent.

Tapping Euro-currency markets

It is against this backdrop, that I see an excellent opportunity for Indian companies, both in the private and public sectors, to tap the Euro-currency markets in a big way in the years ahead. The speed and flexibility with which syndicated Euro-credits can be put together has been mentioned already. State Bank of India and some of the other public sector banks in India have built up the required expertise, contacts and experience to help Indian borrowers raise such loans on optimum terms. True, interest rates in this market are currently at high levels, but then an all-in rate of around 18½ per cent per annum (on the basis of the prevalent 6-month *LIBOR* for dollars) cannot be deemed unduly high under today's double digit inflationary conditions in most countries of the world. After all, an 18½ per cent per annum interest cost works out, on an after-tax basis in the Indian context, to a net cost of just over 8 per cent per annum and any viable project worth the name should be able to support an outgo of this magnitude. Even domestic interest rates in India, averaged out, are not appreciably lower: the rate for medium term loans was recently stepped upto 15 per cent per annum.

It must also be noted that interest rates in the Euro-currency markets exhibit fairly wide fluctuations. Thus, in the Euro-dollar market, the peak has been around 20 per cent (just touched) and the trough around 5-6 per cent. For the last two years, however, interest rates have been ruling relatively high (above 10 per cent for the most part in the Euro-dollar market), but this would seem to be more of an aberration if one views the interest rate graph over a 10-year scenario. The point is that Euro-dollar and Euro-currency interest rates, in general, can well move down in the years ahead to levels below those ruling in India : this cannot be said of interest rates on commercial loans in the Indian scene — at least on the basis of the trends witnessed in the last 10-15 years.

Another possibility in the Euro-currency markets is the raising of medium-term loans in D-marks, Japanese Yen or Swiss Francs where interest rates are generally lower than those in the dollar segment, but then these other currencies are essentially strong and borrowers run the risk of exchange appreciation. A medium-term Euro-loan with a multi-currency option to borrowers to switch from one currency to another every six months or so is yet another sophisticated borrowing vehicle available to Indian companies. It would, however, be desirable to seek expert advice and counsel on these alternatives.

All considered, the time seems quite propitious for India to tap the Euro-currency market for loans — the syndicated medium term market for project loans and the short-term market for acceptance financing to shore up pipeline funds. Of course, the Department of Economic Affairs in the Finance Ministry would have to take a policy decision to go in for such borrowings after giving due consideration to the various factors involved; the need for an element of selectivity and prudence cannot certainly be gainsaid. It is the earnest hope of the growing community of international bankers in India that the country would cash in on the opportunities available to it right now in the Euro-currency markets on terms befitting its growing stature and credit-worthiness and that this would, in turn, act as a further spur to its industrial and economic growth in the years ahead.

25 years ago
a man's nearest bank was
many weary miles away...

Today
it has come
closer to him.
In more ways
than one.

Remote.
That was the word to describe a bank 25 years ago.
Remote—Distant.
In terms of kilometres.
Remote—Cold.
Unapproachable.
Uncaring.
Mindless of all else but profit.

Today the whole spirit of banking has changed. State Bank was the first to break these age-old traditions. And shift the focus from money to man. From profit to people.

Starting with 466 offices, we now have an imposing network of over 5,200 offices—the largest in the country. Spanning the nation from end to end. Carrying banking services literally over hill and dale. Taking banking from the classes to the masses.

Today, a villager enters our office as easily as he visits his Panchayat or Post Office. This attitudinal change, brought about primarily by our Bank, does not yield itself to statistical measurement. But is most significant in the dynamics of rural development.

CHAITRA-SBI-601

Expanding the international business of Indian banks

By N. K. THINGALAYA

IN the present context of international banking, the Indian banks have an increasingly larger role to play in India's international trade. For quite some time now, the Indian banks have been operating, and a few of them very successfully, in different parts of the world. United Kingdom has been the base for international banking for most of the Indian banks till recently. With the amendment in the banking regulations in United Kingdom, it has become relatively easier for the Indian banks to operate in the sterling market as fulfledged banks. A few of the banks, in the recent years, have been instrumental in arranging Euro-dollar loans for some of the industrial projects undertaken in this country. In the recent budget, it has been categorically mentioned that steps have to be taken to increase our foreign exchange reserves largely through expanding our international trade. It is, therefore, essential to explore the possibilities of improving the Indian bank's functioning abroad in order to play a more effective role in international banking. One of the constraints noted in this case is the low capital base of the Indian banks. The capital base in the case of Indian banks is hardly one per cent, much lower than the capital base of the foreign banks.

There is, therefore, a case for raising the capital base of the Indian banks which have foreign branches. The capital base can be raised through the budgetary provisions by the Government of India, the owner of the public sector banks, by raising the total paid up capital of the banks. It is reported that in Italy in the case of public sector banks, the capital base was raised by nearly 50 per cent through the expansion of capital by the government. This is perhaps one way of improving the financial image of the banks which have to compete with other foreign banks abroad. The second method of raising the capital would be through the transfer of a part of the profits earned by each of the banks and capitalising the same. This has been done by a few of the banks in the recent past. There is, however, a limitation here as the volume of profit generated may not be that large to enable the banks to raise the capital substantially out of these resources. In all probability, such a procedure of capitalisation may result in only a marginal increase in the capital base of the banks.

A third method of improving the capital base would be to raise the authorised capital of each of the public sector banks and to allow the banks to subscribe to the capital of each one of the other public sector banks. In this case also perhaps the impact that can be made on the capital base of these banks would be very much limited.

It would be perhaps more expedient to think in terms of an initiative on the part of the Government of India to raise the capital base of the public sector banks. Since the nationalisation of fourteen banks, by way of transferring a part of the profit to the Government of India, the public sector banks have transferred a sizeable amount of money. This is in the neighbourhood of Rs 43 crores. The Government of India, therefore, can consider the feasibility of subscribing to the capital of the public sector banks out of these funds.

Yet another method of improving the image of the Indian banks abroad would be to enable them to share the international business which is largely handled by the State Bank of India at present. The State Bank of India because of its size and the volume of business handled has come to be treated as one of the big banks in the international banking sphere. When India imports a large quantity of oil, the import business amounts to a sizeable volume and this is largely handled by the State Bank of India. If by an arrangement this import business is shared between a few public sector banks, that would result in improving the foreign business of other Indian banks as well.

It may also be noted here that the international business is more profitable compared to the retail banking business which the Indian banks undertake at home. The PEP Committee has revealed that the foreign business is a more profitable venture compared to domestic banking business. By increasing the international banking business of the Indian banks, it is possible to subsidise a large part of their domestic business. From this point of view, it is advisable to permit the Indian banks to explore the possibilities of opening branches in some of the developed countries. Thus, with a view to expand the international banking business of the Indian banks, there is a need for raising their capital base in the first instance. Secondly, there is also a need for liberalising the licensing policy with regard to the branch expansion abroad.

Dr Thingalaya, Head of the Economic Research and Planning Department of Syndicate Bank, is also the Editor of Pigmy Economic Review *published by the Bank, from which this is reproduced.*

Agricultural credit : Removing the crisis of credibility

By A. K. GANGULY

DESPITE the new wind of change sweeping over the banking industry, commercial banks are taking the battering of criticism due to poor customer service, accumulated agricultural overdues, diversion of priority sector advances from the poor to the affluent sections of society, all of which could have created a crisis of confidence for banks—mainly the nationalised ones. But in the euphoria of branch expansion and the phenomenal growth of deposits and advances, banks have not suffered overmuch except giving rise to a crisis of credibility or sometimes even a crisis of identity in recent years. Are the banks biting more than they can chew or have they been assigned a much bigger task than they can perform with a reasonable degree of efficiency? The substantial increase in priority sector advances from 33.3 per cent to 40 per cent by 1985, according to the Krishnaswamy Committee's recommendation, raising the agricultural loans to 16 per cent out of a bank's total advances, out of which 50 per cent should have to be set aside for poor and marginal farmers, 12.5 per cent for small industries, granting of 40 per cent of DRI advances to the scheduled castes and scheduled tribes, utilisation of 60 per cent of deposits mobilised in the rural and semi-urban areas in those areas themselves, all are ambitious tasks.

In the face of the steady erosion in the rate of growth of profits in banks, the RBI—as a godfather of commercial banks—should have extended some subsidy to enable them to discharge their obligations to the poor and neglected sections of society. The net profit of the Reserve Bank has averaged anything between Rs 250 crores and Rs 300 crores a year during the last five years. As banks are required now to put 35 per cent of their resources under the statutory liquidity ratio (SLR) and as the cash reserve ratio (CRR) is now being raised from 6 per cent to 7 per cent in two stages, their profit-earning lendable resources are being steadily eroded. Banks have to consider the present position as one when a thing which cannot be cured has to be endured. They know well enough that in fulfilling their obligations to the poor and neglected sections of society and in implementing the 20-point programme, they have not always covered themselves with glory.

Big profile

Nowhere is this more obvious than in agricultural lending where the average rate of recovery is no more than 51 per cent on an all-India basis and in some states—as in West Bangal—it is no more than 41 per cent. It is true that banks have projected a big profile in agricultural lending in the post-nationalisation period, with the result that the outstanding amount extended to the agricultural sector stood as high as Rs 2,870 crores through over 8.7 million accounts at the end of 1979. This has to be compared with a pitifully low profile of Rs 162 crores extended through only 160,000 accounts as at the end of June 1969 just before nationalisation. This undoubtedly is a big achievement in quantitative terms. And nowhere in the world have banks undertaken so big a task in improving the lot of the poor and neglected sections of the community. In view of the stress laid on commercial banks to implement as many as 13 provisions of the 20-point programme which are directly related to their field of activity and the need to achieve the Sixth Plan target of foodgrains production of 154 million tonnes, the big role of commercial banks in extending credit to agriculture inevitably remains undiminished.

But it is sad to see that much of agricultural lending, apart from not being recovered, has not actually gone to agriculture, which is still a gamble on the rains, but only to such profitable propositions as the financing of fisheries, horticulture, poultry farming and other such related activities. Money-lenders still rule the roost in the villages, providing 48 per cent of total credit in the countryside, although agriculture contributes 47 per cent of India's national income and 75 per cent of the people are still dependent on it.

Mounting overdues

The mounting overdues of agricultural loans have posed the biggest problem for the recycling of funds for agricultural development. The recent remission of co-operative credit by the state governments of Tamil Nadu, Maharashtra and West Bengal has raised a ripple of controversy about the necessity, or even the expediency, of the measure. The RBI Governor, Dr I. G. Patel, has rightly stated that a distinction should have been made between the wilful defaulters and those who defaulted due to their poor financial position. But it is a pity that there is no up-to-date survey on rural indebtedness, although the Government has decided to banish rural povery and to bring down the percentage of people living below the poverty line from 48 to 30 under the Sixth Plan. Although rural borrowings have swelled from Rs 750 crores in 1950-51 to Rs 6,000 crores in 1980, there is no dependable study of the extent and dimension of rural indebtedness in the country. In fact, the institutional structure of agricultural credit presents a picture of too many cooks spoiling the broth—commercial banks, regional rural banks and co-operative banks are fiercely competing among themselves but have been unable to relax the grip of usurious money-lenders in the villages.

No wonder, even today the institutional farm credit structure remains disorganised. Under the circumstances, the president of the Indian Banks Association (IBA) and the chairman of the State Bank, Mr P. C. D. Nambiar, asked the state governments recently to tackle the problem of recovery of agricultural loans, more than half of which could not be recovered. In his address at the recent annual general meeting of the IBA, Mr Nambiar rightly stressed the need to set up suitable machinery to expedite the recovery of agricultural dues, enact necessary legislation on the lines of the model Bill recommended by the Talwar Committee and what is most important, carry out an effective propaganda campaign in the villages on the need to repay the agricultural loans to enable the credit agencies to recycle the funds more effectively. Mr Nambiar could have added that commercial banks have done precious little so far in rural publicity about the need for prompt repayment of agricultural credit.

Serious anomaly

Another serious anomaly remains in the Integrated Rural Development

---

Mr Ganguly is former editor of Capital.

Programme (IRDP) which appears to have been bogged down in the morass of problems before it could get off the ground. The Sixth Plan envisages assistance to 3,000 families per block spreading in 5,000 blocks whereas in reality the number of units which could be financed per block in backward areas would be much smaller. The question that has to be considered in this context is whether the rural areas have the necessary infrastructure for this purpose. Secondly, the credit needs of 3,000 families per block in 5,000 blocks might—on a conservative estimate—would require more than Rs 7,500 crores. Mr Nambiar has said that while it may not be beyond the capacity of the credit institutions to supply the amount, the implications of the massive deployment of funds of this dimension should be studied carefully. This apart, since the IRDP will be extended to all blocks in the country, banks will have to cater to the needs of beneficiaries scattered over a wide geographical area. One should not think, therefore, that it would be quite an easy task to cover 500,000 villages in the country. Since IRDP is expected to cover the poorest of the poor, the task of combining the IRDP with the National Rural Employment Programme (NREP), especially at the block level, should have to be seriously considered.

The main thrust of the IRDP programme is to cover at least 15 million people who live below the poverty line. To cover this, some wide-ranging measures are proposed to be taken to cover the administrative, planning, monitoring and credit utilisation aspects through the existing financial agencies operating in the countryside. The guidelines issued by the Planning Commission on block level planning envisages that the State Government should set aside 10 per cent of the divisible outlay of their Plans, the main aim being to cover "the poorest of the poor". This will raise several problems. First, the identification of this strata of rural poor all over the country would pose a formidable problem. It is being considered that a family of five with a total annual income of Rs 3,500 or Rs 700 *per capita* per year should be laid down as the guideline. But there is no survey of the people who earn this level of income all over the country, the census data either being perfunctory or not available in detail up to now. Secondly, the intended beneficiaries of the IRDP programme are land-based.

But this is not enough. In fact, the criterion, according to some, should have to be shifted from the land-based to income-based. Thirdly, there are many a sceptic who point out that the level of lending of the order of Rs 3,000 crores from the banking sector to the 15 million people may not be achieved by the end of the Sixth Plan quiquennium, notwithstanding the assurance given by the Banking Department of the Reserve Bank of India.

Formidable task

The task may prove to be formidable in view of the following constraints: (1) The absence of bank branches in the remoter countryside, (2) inadequate staff in the branches to undertake a massive task of this nature, (3) the absence of field officers to undertake the survey work and (4) lack of enthusiasm among the banks to undertake risky agricultural operations. In fact, the lead banks have found to their dismay that they cannot gather the required information in the lead districts from other banks which are expected to cooperate with them in preparing the district credit plans. This apart, in undertaking the minor irrigation programmes, the banks find to their dismay that there is no adequate survey of ground water potential.

Furthermore, while the country aims at a white revolution, there is no adequate emphasis on the cattle development programme. Nor is there any emphasis on creating a marketing infrastructure for making the IRDP a success. Even the Khadi and Village Industries Commission has yet to spread its network to all the districts in the states, thereby suggesting the need for a more rapid expansion of the marketing facilities. But the biggest defect of the IRDP is the absence of an emphasis on the training programmes for rural youths who would undertake the rural development schemes. For this purpose, it will be necessary to set up composite training centres in all parts of the country.

It is a pity that before undertaking a massive task like the IRDP with an aim at improving the living standards of the poor and neglected sections of society, neither the Planning Commission nor the Government had laid the necessary stress on creating the required infrastructure. If the scheme does not click due to lack of foresight and planning, who will bale out the banks after their miserable performance? Under the circumstances, the banks and other credit agencies are understandably dragging their feet without being able to see any light at the other end of the tunnel. They have, meanwhile, nothing to look forward to except a plethora of problems. So the bouquets have to be shared instead of passing on the brickbats, especially by our policy-makers.

Bank finance for rural industries

By Y. C. SHARMA

THE important role of rural industrialisation in ensuring the balanced growth of the rural economy is well-recognised by the planners, economists and administrators all alike. With the steep rise in population, the land-man ratio is becoming increasingly unfavourable, and the pressure on land is threatening to be unendurable for variety of reasons. The number of land-owning farmers is decreasing, the traditional artisans are deserting their hereditary occupations in increasing number, and the class of landless labourers is expanding fast, who have to depend on nothing but agriculture.

It is a queer fact that though our population is increasing at the rate of 2.2 per cent per annum, or more, the number of traditional artisans mainly dependent on cottage industries has been declining fast with every census, and in 1971, there were only 7 million left in this category. Further, the vast number of Indian farmers (about 47 per cent) are only marginal farmers holding land less than five hectares. This explains one of the lowest income per capita of Indian farmers in the entire world. No doubt improved agriculture and better inputs, particularly more and more irrigation facilities, would improve the economic conditions of the farming community, but its beneficiaries would generally be medium and big farmers, mainly because there are too many people dependent on the land.

The real solution of the abject poverty and chronic under-employment and unemployment lies in diversification of the rural economy, and large-scale generation of productive employment in non-farm sector. In fact the Planning Commission had decided more than two decades ago to create 4.6 crores jobs between 1961-62 and 1976-77 to reduce the percentage of population dependent on agriculture from 70 to 60. But unfortunately the position has remained unchanged todate. It is absolutely necessary not only to stop the traditional artisans from joining the rank of agricultural proletariate, or migrating to the cities to become the scum of urban population, but also to divert a sizable number from agriculture to rural industries by making them an attractive source of income.

Present position

One of the major requirements of rural industries, like any other economic activities is credit, and it is extremely difficult and expensive for the poor resourceless artisans to secure adequate capital on reasonable terms for carrying on his industrial activity in an uninterrupted manner. All India Debt and Investment Survey 1971 conducted by RBI revealed that 39 per cent of the artisans in rural areas were under debt, with debt to assets ratio as high as 42 per cent. The institutional credit formed a meagre 4.8 per cent of the total credit given to the artisans. The cost of debts, according to the survey, was 18.5 per cent. However, in practice the rate of interest for many helpless artisans is reported to be not less than 24 per cent anytime; rather it may be as high as 48 per cent also in many cases. What makes it worse is the fact that the borrowing artisans are compelled as a part of loan terms, to purchase the raw materials from, and to sell the finished products to the money-lender-cum-trader alone at prices, which are invariably disadvantageous to the artisans. Thus the artisans are trebly exploited by the usurous merchants, who are the main source of finance to them. According to an estimate, the artisans as a class carry the heaviest burden of debt in the rural areas at an average rate of Rs 1,255 per artisan.

Apart from 70 lakh regular artisans in the country, an equal number can easily be estimated to be depending on the cottage industries as auxilliary means of income (with potentiality of becoming major source of income also, under favourable conditions). Calculated on the basis of average composite credit requirements of Rs 6,500 per artisan, both long-term for capital expenditure and short-term for working capital without rigid division, total credit requirement of 1.40 crore artisans in India can be easily estimated at Rs 9,100 crores. Against this background of huge credit requirements of rural artisans, the help extended by the financial institutions at present is wholly insignificant.

Agencies of institutional finance

The earliest organised efforts to cater to the credit requirements of artisans as a class were made through organising industrial co-operatives, particularly for the benefit of weavers. Though the co-operative structure of the country continues to be predominantly attuned to agricultural credit requirements, there were 40,100 industrial co-operative societies in India in June 1978 (the number may be about 45,000 now), out of which 14,367 were weavers co-operatives, 254 agricultural processing societies, and 24,874 other industrial co-operatives, with outstanding loans at Rs 12 crores, Rs 2 crores and Rs 12 crores respectively for the three groups. Further, there were nine industrial co-operative banks with Rs 23 crores as outstanding loans (Rs 6 crores medium and long-term, and Rs 17 crores short-term). In KVI sector there were in all 28,018 co-operative societies in June 1980, out of which 18,375 were financed by the Khadi & Village Industries Commission (KVIC) and state khadi & village industries boards. However, out of total, only 8,338 were reported to be working (2,252 alone were working with profit), and as many as 8,684 were reported to be defunt/dormant apart from 2,942 under liquidation. The KVI industrial co-operatives financed by KVIC and the state boards borrowed in all Rs 19.06 crores (Rs 17.94 crores from KVIC/state boards, Rs 0.45 crore from state governments 0.52 crore from co-operative banks and Rs 0.15 crore from others), against which Rs 6.37 crores were overdue. Thus it would be seen that while as much as 90 per cent of the borrowings of KVI co-operatives were from KVIC/state boards, and the contribution of co-operatives banks was wholly negligible, the vast majority of these co-operatives were as good as dead. The overall picture of the industrial co-operatives in general also is equally dismal.

The decision to extend the normal commercial banking facilities to the rural areas in a big way was yet another important step to cater to the credit requirements of the rural people, including the artisan class. This programme got special impetus after the nationalisation of the commercial banks in 1969. Table 1 presents the picture regarding expansion of banking activities in the rural areas in 11 years:

From the table it is clear that between 1969 and 1980 not only the absolute number of rural branches has gone up by about 750 per cent, but also the proportion of the rural branches in total number of branches all over India has also gone to 22.4 per cent to 46.6 per cent. However, deposits secured by the rural branches have grown in still higher proportion from Rs 145 crores to Rs 3.538 crores, which shows appreciable development of the banking habits in the rural areas. The amount of credit

---

Mr Sharma is deputy chief executive Officer of Khadi and Village Industries Commission. The views expressed here are personal.

distributed by rural branches has also gone up from a meagre Rs 54 crores to Rs 2,016 crores over a 11-year period. One significant fact which emerges from the above figures is that a net amount of about Rs 1,500 crores has been drained off from the rural areas for utilisation mostly in the metropolitan areas. If the semi urban branches are also taken into account, the surplus deposits transferred to metropolis would come to about Rs 5,000 crores. Obviously, metropolitan cities continued to have a lion's share in the credit sanctioned by the commercial banks. There, the credit deposit ratio is 87.9 per cent against 57 per cent in the rural areas. Thus the credit policy of the commercial banks continues to be heavily weighted in favour of the metropolitan cities and also to some considerable extent urban areas.

The fact that the credit policy of the banks favours highly organised industrial sector is obvious from the Table 2.

Table 2 shows that during the year ending June 1980 medium and large scale industrial units availed of the credit to the extent of Rs 8,310 crores, coming to 38.2 per cent of the total credit sanctioned, as against the entire priority sectors getting Rs 6,970 crores only coming to 32.1 per cent of the total credits. Further amongst the priority sectors, the share of small scale industries was Rs 2,711 crores *i.e.* 12.5 per cent of the total credits. In this context it is important to point out that tiny sectors constitute only a very small part of the small scale industries sector, and in fact, its interests are substantially at variance from those of small scale industries, for in contrast to quite developed and sophisticated technology of the small scale industries, the tiny sectors employs only traditional or slightly improved intermediate technology.

Table 1 : Centre-wise distribution of branches, deposits and credit of all commercial banks : June-end 1969 and June-end 1980

Population group	June-end 1969				June-end 1980			
	Branches	Deposits (Rs crores)	Credit (Rs crores)	Credit-deposit ratio (Per cent)	Branches	Deposits(a) (Rs crores)	Credit(a) (Rs crores)	Credit-deposit ratio (Per cent)
Rural	1,832 (22.4)	145 (3.1)	54 (1.5)	37.2	15,101 (46.6)	3,538 (11.3)	2,016 (9.4)	57.0
Semi-urban	3,322 (40.1)	1,024 (22.0)	407 (11.3)	39.7	8,078 (24.9)	7,079 (22.5)	3,435 (16.0)	48.5
Urban	1,447 (17.5)	1,209 (25.9)	722 (20.0)	59.7	4,856 (15.0)	7,828 (24.9)	4,604 (21.4)	58.8
Metropolitan	1,661 (20.0)	2,287 (49.0)	2,426 (67.2)	106.1	4,384 (13.5)	12,993 (41.3)	11,421 (53.2)	87.9
Total	8,262 (100.0)	4,665 (100.0)	3,609 (100.0)	77.4	32,419 (100.0)	31,438 (100.0)	21,476 (100.0)	68.3

Notes : (a) Data relate to scheduled commercial banks as at the end of December, 1979

Figures in brackets indicate percentages to total

Rural : Population up to 10,000

Semi-urban : Population over 10,000 and up to 1,00,000

Urban : Population over 1,00,000 and up to 10,00,000

Metropolitan : Population over 10,00.000

Table 2 : Sectoral deployment of gross bank credit
(Including bills rediscounted with the RBI)

	June 1977		June 1978		June 1979		June 1980	
	Rs crores	Per cent	Rs crores	Per cent	Rs crores	Per cent	Rs crores	Per cent
I. Public food procurement credit ..	2,536	18.6	2,525	15.8	2,996	15.5	2,414	11.1
II. (a) Priority sectors	3,486	25.6	4,334	27.2	5,677	29.3	6,974	32.1
(i) Agriculture	1,381	10.2	1,726	10.8	2,288	11.8	2,911	13.4
(ii) Small-scale industries ..	1,460	10.7	1,756	11.0	2,252	11.6	2,711	12.5
(iii) Other priority sectors ..	645	4.7	852	5.3	1,137	5.9	1,352	6.2
(b) Industry (medium and large) ..	5,372	39.5	6,249	39.2	7,291	37.7	8,310	38.2
(c) Wholesale trade (other than food procurement)	1,053	7.8	1,424	8.9	1,612	8.3	1,863	8.6
(d) Other sectors	1,160	8.5	1,428	8.9	1,767	9.1	2,188	10.0
III. Gross bank credit (I+II)	13,607	100.0	15,960	100.0	19,343	100.0	21,749	100.0

Note : Data relate to major banks which account for about 95 per cent of gross bank credit.

The advances given by the nationalised banks under the differential rate of interest schemes would give some picture about the availability of institutional finance for the tiny sectors. (See Table 3)

It is significant to observe that despite the steady growth of DRI advances standing at Rs 140 crores in 1979, they accounted for mere 0.58 per cent of the total advances given by the banks.

The scheme of the lead banks was also devised in order to give a fillip to the banking activities in virgin rural areas. However, it is significant that in 398 lead districts alloted to various public sector banks, 5,330 new branches were opened by these banks up to December 31, 1979 in the lead districts, against 10,911 branches opened by these very banks outside their respective lead districts. It is clear from these facts, that while the lead bank scheme did contribute to the extension of the banking activities in the new areas, the attention of the lead banks was diverted more to areas outside their lead districts.

Regional rural banks

The regional rural banks form the latest category of financial institutions to develop banking activities in rural areas for farm as well as non-farm sectors. The RRBs have already made significant mark in the sphere of rural banking and within a short span of five years, they have amply demonstrated their capability to serve the purpose for which they were established. The superiority of RRBs as an agency of rural credit over the rural branches of the commercial banks lies in their relatively lower overhead cost, unassuming and low profile amongst rather simple rural folks, local participation in management, familiarity of the local staff with the people of the area and close association with the rural development agencies.

Table 3: Advances by public sector banks* under the Scheme of Differential Rate of Interest: 1972 to 1979

As at the end of December	Borrowal accounts (Lakhs)	Amount outstanding (Rs crores)	Percentage of DRI advances to total advances of the previous year
1972 ..	0.26	0.87	0.02
1973 ..	2.30	10.06	0.22
1974 ..	3.13	13.35	0.23
1975 ..	4.65	20.99	0.31
1976 ..	10.05	47.24	0.56
1977 ..	13.92	67.99	0.61
1978 ..	16.20	90.00	0.66
1979 ..	20.76	139.80	0.85

* Exclude data on six banks nationalised on April 15, 1980.

The Dantwalla Committee constituted by the Reserve Bank in 1977 to review the working of RRBs has highly commended their contribution towards improving quality and quantity of the credit flows to the rural areas. The committee observed that "RRBs with modifications in their organisation and functions can become a very useful component in the totality of the rural credit structure. In fact, we are convinced that such an institution is needed to make good some inadequacies in the rural credit system". The committee also pointed out that though strenuous efforts made during the past decades or so to put the primary agriculture co-operative credit society and farmers service society on a sound footing, failed to achieve the expected results. The co-operative credit structure should not be disturbed at the base level. In fact the RRBs could fill the gap in rural credit wherever it existed on account of inadequacy of co-operative credit structure. The committee envisaged that, over a period of time, there would be a total replacement of rural branches of commercial banks by RRBs and their branches in their respective commanding areas. The RRBs could co-exist with the district central co-operative banks also without any clash of interest. It is indeed gratifying that the number of RRBs has already gone up to 52 in the whole of country and they have carved out a distinct place for themselves in the field or rural credit. Their contribution in catering to the requirements of poor rural artisan with co-operation and help of the state khadi and village industries boards and district industries centres in many states has been found quite conducive to the growth of KVI programme.

Existing schemes

At present, the following schemes are operating to provide institutional finances to the rural artisans and entrepreneurs.

1. Differential rate of interest scheme.
2. Special schemes for financing handloom weavers.
3. Integrated rural development scheme.
4. KVIC interest subsidy scheme.
5. Reserve Bank of India scheme for cottage industry.
6. State governments scheme such as artisans Employment Guarantee Scheme of Maharashtra, and *Antiodya* schemes in Rajasthan and UP etc.

The KVIC interest subsidy scheme has come into force from April 1, 1977. Under this scheme, the KVIC institutions individual entrepreneurs and artisans taking loans from the bank for running KVIC units are required to bear the burden of interest on bank loan only up to the extent of 4 per cent per annum and the Commission undertakes to reimburse the difference between initial 4 per cent and the lending rate charged by the banks directly to the banks. The scheme is meant for medium and long-term loans for capital expenditure as well as the working capital requirements for short-term.

Further it covers all the financial institutions including the commercial banks, co-operative banks, refinancing agencies including IDBI, etc. It may be recalled that right from 1956 onwards, when Karve Committee for the first time suggested KVIC institutions going in for more and more institutional finance particularly for working capital requirements, various committees and working groups have emphasised the importance of involving the financial institutions in the development of KVIC sector. It is indeed gratifying that the Reserve Bank of India has included rural industries including KVIs in the priority sector for the purpose not only for the allocation of credit but also charging concessional rate of interest at 13.5 per cent per annum, on the advances given for the purpose of purchasing and supplying of inputs to, and/for marketing of outputs of the artisans and village and cottage industry's units. It is hoped, that with this significant step on the part of RBI the share of institutional finance in the development of rural industries sector will go on increasing steadily.

During 1980-81 KVIC not only took the advantage of cash credit limits to the extent of Rs 10.05 crores for the purchase of raw materials for cotton and woollen, khadi as well as village industries like non-edible oils and soap industry, cottage match industry and bee keeping industry, but also issued the eligibility certificates to 80 KVI institutions and 22 state khadi industry boards for a total amount of Rs 27.58 crores. However, the institutions are rather slow in availing the facilities for bank credit and it is estimated that during 1980-81 they would be in a position to utilise bank credit to the extent of about Rs 6 crores only (against Rs 4.5 crores in 1979-80) These figures of utilisation of bank credit

Plan for his bright future

It's you who can shape your child's future. Save money regularly for him. He will soon need books, school fees etc. These expenses will increase as he goes for higher studies. Plan for his security and prosperity.

There are several attractive Saving Schemes for you.

★ **MULTI-BENEFIT & OLD AGE DEPOSIT—**
A deposit of Rs. 5,000 would fetch you almost, Rs. 10,000 after seven years.

★ **SPECIAL FIXED DEPOSIT—**
Earn an extra regular income - Deposit of Rs. 30,000 for 36 months will earn monthly interest of Rs. 247.92

★ **RECURRING DEPOSIT—**
Save in monthly instalments of Rs. 5 or its multiples and get a large amount at maturity.

★ **MINI DEPOSIT—**
Open an account with just Rs. 5 and keep it growing with as little as 50 paise. Collections are made regularly at your doorstep.

★ **DEPOSIT LINKED HOUSING LOAN—**
Deposit in monthly instalments. At maturity receive loan equal to 150% of maturity value or Rs. 50,000, whichever is less - to build or buy a house.

are exclusive of the bank credit utilised under Artisan Employment Guarantee Scheme of Maharashtra to the extent of Rs 4.50 crores during 1980-81. The interest subsidy disbursed by KVIC in 1980-81 amounted to Rs 82.75 lakhs.

Future expectations

Though only a humble beginning has been made as yet regarding flow of institutional finance for the development of KVI sector and only about Rs 10 crores have been canalised from the banks to this sector against the total outstanding loans of Rs 250 crores at the end of 1980-81, KVIC has a very ambitious plan to employ more and more and bank finance to achieve its Sixth Plan target. It may be observed in this context that out of total requirements of funds for KVIC Sixth Plan at Rs 1,175 crores as much as Rs 520 crores are expected to be availed by way of institutional finance. In short fulfilling the targets of Sixth Five Year Plan would be impossible without involving the banks in KVI programme in a big way. Not only this, the Ministry of Rural Reconstruction, Government of India, has also visualised a very important role for the banks in implementation of its integrated rural development programme of which Industries, Services and Business (ISB) are important component. According to the scheme approved by the Government of India, only one-third of the total finance is to come as subsidy from the Government and the remaining two-thirds in each case is to be given as loan by the banks under IRD Differential rate of interest as well composite loan scheme would be applicable to all the *ISB/TRYSEM* beneficiaries including the KVIC sector. The banks would be closely associated at various stages of the implementation of the scheme right from the stage of preparing project profiles and construction of block level workshop.

KVIC has prepared model schemes in 13 village industries, which would facilitate lending by the banks to the individual entrepreneurs and artisans. They have been prepared fully keeping in view the requirements of economic viability of various schemes. The IRD scheme expects the officials of the lead banks to monitor the loans given by the banks, to the KVI sector in general and the *ISB/TRYSEM* beneficiaries in particular. The problems of non-financing or inadequate financing are to be referred to banking co-ordination committee at appropriate level. Thus the role of the banks in promoting rural industrialisation in the country is bound to assume greater and greater significance during the Sixth Plan period.

Problems and solutions

Despite the fact that there is a considerable appreciation and understanding in the higher circles of the role of institutional financing in the development of rural industries, its progress is not likely to be very smooth, for it is entirely a new field of activity for the bank officials. The credit policy of the banks has as yet been oriented towards big borrowers, for it involves lesser efforts, easier control and quick adjustments. On the other hand dealing with thousands of small KVI institutions and lakhs of individual rural artisans would definitely mean considerable inconvenience to the banks. The botheration increases for the banks not only on account of sharp increase in the number of the borrowers' accounts, but also owing to small volume of their operations, and lack of banking habits and the required financial discipline, to which they have to subject themselves for obtaining credit from the banks. Things are likely to become slightly frustrating, as the banks would have to deal with modestly educated office-bearers of small rural industries institutions, entrepreneurs and artisans. Rigid application of the limit of 10 kilometres from the rural branches of banks for sanction of loans to any KVI unit may also come in the way of speedy rural industrialisation.

Some positive steps will have to be taken without further loss of time to ensure that a scheme of providing bank finance to the rural industries units functions effectively. First of all the banks officers particularly at the branch level, would have to be properly and adequately oriented in the functioning and requirements of the rural industrial units. Similarly, special cells will have to be opened in all the commercial banks at the regional as well as national levels to give a push to bank finance in the rural industries. In this context, the clearance of KVIC model schemes by the banks' headquarters would pave the way of providing credit facilities, to the individual entrepreneurs and artisans in the field. As mentioned in the Industrial Policy of the Government of India, it should be insisted upon that a certain percentage of credit would be earmarked for the small scale industries, particularly tiny sector. Atleast 2/3rd of the loans advanced by RRBs should be for the benefit of the local rural people only, including the rural artisans. It would be still better if it is made obligatory on the part of the RRBs to sanction definite percentage of loans, say 10 per cent of all advances, for the benefit of tiny rural industry units.

Particular attention would have to be given to encourage and strengthen RRBs and ensure that they are given all those advantages which are already available to the co-operative sector, such as automatic registration of land, and building, exemption from the stamp duty, realisation of debt arrears as revenue recovery etc. Facilities of insurance cover, credit-risk cover, eligibility to obtain refinance from RBI and IDBI etc should be provided continued in case of RRBs without any watch. There should also be proper organisational set up in the Reserve Bank of India to look after RRBs' working.

Role of banks

It is to be emphasised that in the complex economic conditions prevailing in the rural India, the commercial banks or RRBs should not remain contented with the traditional role of lender alone. They will have to carry on their activities in the wider content as the friend, philosopher and guide of the rural industries units, trying to understand their problems in a sympathetic manner encouraging them to take the maximum possible advantage of bank finance as well as to guide them in their functioning particularly regarding maintenance of their accounts. In short the banks may have to assume the role of catalytic agents in the process of rural industrialisation of India.

Further, it is also to be appreciated that credit is not an end by itself, but is a means only to enable the rural industrial units to function efficiently and smoothly. Mere sanction of bank credit may not be enough to put rural industries units in proper shape. Therefore, along with adequate credit facilities, some important supporting measures would also have to be taken simultaneously, particularly regarding the regular supply of the required raw materials at reasonable prices for the rural industries, and marketing of their products in a profitable manner to reap the full benefit. A chain of raw materials banks and rural marketing organisations would have to work hand in hand with the banks to produce the desired results in the field of rural industrialisation.

The bank that doubles its growth every three years

Yes, Canara Bank has grown in every sphere. And the results;-

Exceptional growth rate in 1980 – 33.5% – the highest recorded by the banking industry. Deposits have doubled every 3 years since nationalisation and have now crossed Rs.2099 crores.

The Bank now has a clientele of 94.68 lakhs – one of the largest in the industry.

The priority sector credit to net bank credit ratio is 34.8%, with over ten lakh borrowers who benefitted.

The share of agricultural credit in net bank credit is now 15.1%.

73.6% of the D.I.R. loans were made through the Bank's rural and semi-urban branches as against the requirement of 66.67%.

Foreign business turnover scaled a new height of almost Rs. 1000/- crores.

31st December 1979		**STATEMENT OF POSITION** **Capital and Liabilities**		**31st December 1980**

Federal farm credit system of USA: Towards financial consolidation

By B. H. ELAVIA

AMERICAN agriculture is a highly developed and efficient profession providing the country an abundance of quality food and fibre through periods of depression, inflation, conflict and peace. It is the nation's largest and perhaps the most essential industry.

The total assets of the farmers were valued at $ 950 billion and total farm debt was $ 158 billion on January 1, 1980. Farmers' average debt-assets ratio and debt equity ratio were 16.6 and 19.9 per cent respectively. The typewise classification of farm debt was; real estate debt $ 83 billion, non-real estate debt $ 70 billion and Commodity Credit Corporation loans $ 4.5 billion.

Agricultural was a highly capital intensive business with the capital investment per man ($ 120,000) in production agriculture being two to three times the investment in most non-agricultural industries. The input-wise cost of agriculture in 1980, was land 20 per cent, labour 15 per cent and capital 65 per cent. And yet, labour continues to be substituted by capital.

Only through the use of increasingly large amounts of borrowed capital have agricultural producers been able to gain the necessary efficiency from enlarging the scope of their operations, apply science and technology to land or to pass the ownership of agricultural resources to the succeeding generation.

The Federal Farm Credit System (FCS) is designed to provide specialised credit which the sophisticated American agriculture needs. The fast growing financial needs of the system in the recent past has led to innovate methods of financing, which should be a matter of interest to all concerned in our country, with mobilising funds, to meet the ever increasing demand of farm credit, through the co-operative credit system. Indian agriculture has come of age and will soon have to learn to live without subsidised credit and to chart out its share of loanable funds from the national and international money markets.

This paper makes a humble attempt to present the structure of the Federal Farm Credit System of USA and to examine the recent innovation in its financing pattern.

Performance of FCS

The Farm Credit System is able to obtain all the funds demanded by farmers and ranchers directly from the money markets of the country and abroad. Thus, it functions as residual suppliers of loan funds to the farmers. Not only the farmers borrow more money from FCS than from any other source, but the system's share of farm debt fluctuates with the change in activities of other lenders.

FCS made loans totalling $ 59 billion during 1979, a substantial 29 per cent increase over the $ 245 billion in loans made a year before.

The system's share of net debt flow increased from 24.9 per cent on January 1, 1978 to 35.6 per cent on January 1, 1980. Two factors contributed to the spurt, first, high demand for loan funds and second, a shortage of loanable funds from commercial banks.

The FCS's loans outstanding totalled $ 57.8 billion, on December 31, 1979. The increase in loans outstanding over the year was 24.3 per cent, the highest rate of the decade. The system's share of the total farm debt outstanding worked out to 29.2 per cent. 1979 was a land-mark year in the history of FCS. The system emerged as the biggest lender of real estate farm debt. It's share of the total was 35.5 per cent, which exceeded that of 'individuals and others' (the traditional leaders) which was 34 per cent, as on January 1, 1980.

Among the lenders of the non-real estate debt, FCS ranked second after the commercial banks. On January 1, 1980, the shares of FCS and commercial banks of the total non-real estate debt were 23.5 and 40.7 per cent, respectively.

Structure

Credit is the key to success of American agriculture. The FCS is designed to improve the income of farmers and ranchers by furnishing sound, adequate and constructive credit and closely related services to them, their cooperatives and to selected farm related businesses necessary for efficient farm operations. The system also provides credit for rural homes, to producers and harvesters of aquatic products and their associations.

This is accomplished through the three component parts of the System — Federal Land Banks and Federal Land Bank Associations, Federal Intermediate Credit Banks and Production Credit Associations, and the Banks for Co-operatives. Each plays a key role in filling the unique credit requirements of its borrowers.

The FCS is owned by nearly a million American farmers and 4,000 of their marketing, supply and business service cooperatives.

In each of the 12 Farm Credit Districts throughout the United States there is a Federal Land Bank, a Federal Intermediate Credit Bank and a Bank for co-operatives. Besides these 36 banks there is a Central Bank for Co-operatives in Denver, Colorado. These 37 banks constitute the FCS.

The Federal Land Banks make long term loans secured by first mortgages on farm real estate through local Federal Land Bank Associations which numbered 505 as on December 31, 1981. The loans are from 5 to 40 years for any agricultural purpose and for other requirements. Common purposes include the purchase of farms, farm land, equipment and live-stock; refinancing existing mortgages and paying other debts; constructing and repairing buildings and financing other farm, farm home or family needs. Since the banks are primarily agricultural lenders, credit extended for other than agricultural purposes is dependent on the agricultural assets of the borrower. Owners of farm related businesses may borrow to purchase or refinance necessary sites, capital structure, equipment, and for initial working capital.

Loans to rural residents may be made for the purposes of building, buying, remodelling, refinancing or repairing a rural home.

The banks can make any sound loans. The amount of credit extended, based on the credit worthiness of the applicant, cannot exceed 85 per cent of the colleteral taken as security.

The 12 Federal Intermediate Credit Banks (FICBs) provide loan funds to

---

Dr (Mrs) Elavia is Reader in Banking Department of Banking and Business Finance, M. S. University, Baroda.

more than 425 local Production Credit Associations (PCAs) with a total of nearly 1,900 offices. They provide funds to PCAs either by discounting the notes of farmers given to the PCAs or by making direct loans to them. The banks also discount farmers' notes given to about 125 other financial institutions. The FICBs may also participate with the PCAs in making loans. Similarly PCAs may participate with one another in making loans and may also participate with other institutions in financing agricultural producers, including commercial banks.

PCAs make loans for almost every farm, farm home and farm family need. Most loans are for production purposes, such as meeting current farm expenses and mature within a year. However, many loans are made for capital purposes, such as buying equipment and live-stock and may be written for period upto seven years.

PCAs also make loans for the repair, remodelling of non-farm rural homes, for farm related businesses and to fishermen, in latter case loan may be made upto 15 years.

There are 12 district banks for co-operatives one in each district and one Central Bank for Co-operatives in Denver, Colorado. Each district bank makes seasonal and term loans for farmers' marketing, supply and business service co-operatives in its own territory. They also lend to societies of producers' of aquatic products. The Central Bank for Co-operatives participates in larger loans originated by district banks for co-operatives.

Consolidated systemwide bonds and notes

The Farm Credit Banks obtain most of their loan funds through the sale of securities. Based on a long and successful history, these securities represent a sound investment in American agriculture. The Federal Land Banks issued their first securities in 1917. The Federal Intermediate Credit Banks followed in 1924 and the Banks for Co-operatives in 1950. The outstanding credit quality of the Farm Credit Banks has enhanced the market acceptance of Farm Credit securities on a worldwide basis, with an active secondary market trading outstanding issues.

Farm Credit Banks were initially capitalised with government funds, Government capital was repaid over a period of years ending in 1968.

In recognition of the origin of the system, revolving funds are maintained in the US Treasury to permit the Governor of the Farm Credit Administration to make temporary investments in the stock of the Federal Intermediate Credit Banks and the Banks for Co-operatives in the amounts of $ 112 million and $ 149 million respectively. Additionally, the Secretary of the Treasury may deposit upto $ 6 million with the Federal Land Banks. The Governor of the Farm Credit Administration also follows a policy of co-operative consultation with the US Treasury when securities are issued.

The Farm Credit Banks maintain a Fiscal Agency to issue, market and handle their securities, as provided in the Farm Credit Act of 1971. The Fiscal Agency located in New York city, manages a selling group of approximately 170 dealers who offer Farm Credit Securities.

The Fiscal Agency-selling group structure has been effective in distributing Farm Credit securities on a worldwide basis to all types of investors — commercial banks, savings and loan associations, individuals, insurance companies, states and municipalities, foreign banks and governments, and others.

The American agricultural community's financial needs have increased dramatically over the past 10 years and are projected to increase further in the years ahead. To assure the continued acquisition of funds in an orderly and efficient manner, the Farm Credit Banks introduced the Federal Farm Credit Banks consolidated Systemwide Bond in 1977. As the secured joint and several obligation of the 37 Farm Credit Banks, this bond combines the strengths of the Federal Land Banks, the Federal Intermediate Credit Banks and the Banks for Co-operatives.

The Systemwide Bond was initially introduced to complement bonds issued by each of the bank groups and is now the sole bond issued by the Farm Credit Banks. This transition was accomplished on January 1, 1979. Bonds previously issued by the Farm Credit Banks will continue to be available in the secondary market until maturity.

Federal Farm Credit Banks consolidated systemwide notes are the secured joint and several obligations of the 37 Farm Credit Banks. These notes, which are sold on a discount basis with maturities of 5-270 days, are used to complement short-term borrowings, to provide a source of interim funds between bond sales, and to supply the banks with flexibility in securing funds during periods of unexpected demand. The Farm Credit Banks maintain lines of credit of about $ 2 billion with commercial banks and other financial institutions to back up these notes.

Record of stability

The banks composing the Farm Credit System have never failed to pay principal and interest on their obligations when due, in the last fifty years. With this history of unquestioned success, the Farm Credit Banks stand today as important financial institutions through which investors can profitably participate in the agricultural industry and farmers can obtain capital for producing the nation's food and fibre.

With the growing financial needs of Indian agriculture, it is time for us to establish a direct 'link' between the co-operative credit system and the national money market. Such a 'link' may not only provide increasing quantum of funds for agricultural development but more importantly, it may instill self-confidence and financial discipline in our fast deteriorating co-operative credit system. Of course, in the present situation the co-operative bonds or notes will have to be fully guaranteed by the state. Detailed mechanism of the 'link' may be worked out to suit the local conditions of our country — but the experiment based on the American model, brooks no delay.

No innovations or new services

By S. G. SHAH
Our Banking Correspondent

BY the time this comes out in the print the latest data on the progress of the banking system will be released by the RBI and the Government. It is a measure of their efforts to build up an image of the banking industry in terms of physical achievements—Rs 40,000 crores of deposits, 36,000 branches, the vast increase in rural and semi-urban branches, rural and agricultural advances and bringing new classes of people into the fold of priority sector advances. (*See Document and Statistical Profile*).

In all the current fanfare about the progress made by the banking system since nationalisation, a few elements have been totally ignored. They are new services and innovations, quality of banking services, monitoring of commercial advances and total indifference towards performance either of the bank or of the borrowers. It is the analytical content of these four elements that should determine the tone of banking progress rather than the mere enumeration of the progress made in accounts and amounts, branches and business, new classes and masses, 20 points and four pillars of banking and so on.

New services

Whenever bankers think or talk of new services or innovations, they talk in terms of a wide variety of deposit schemes and interest payment or gift arrangements (which incidentally are common to almost all the banks). They rarely go beyond these into the real area of actual and potential innovations.

The entire new area of the 20 point programme has at its base lending to new classes of masses, at higher risks and very costly retail banking. They all have forced bankers into developing new and different techniques of lending and monitoring. Yet bankers talk only of the new classes and masses at all forums, not of the new techniques of assessing, lending, supervising and recovery. In these professional and systems areas, plenty of work has been done, but it has not been documented and discussed anywhere.

Further some ingenious young bankers have developed new techniques of lending and monitoring, but their ideas, experiences and expertise have not been pooled together and shared. And much of the vital achievements have disappeared through retirements and resignations.

As a result, the banking system has not made many significant changes in its systems and procedures of lending to the smaller people and businesses. The styles and systems of lending and supervision for smaller accounts are also the same as for the large business accounts. The result has been to push up administrative costs of lending and to push down the quality of loans, since everyone is so busy and no one has the time to attend to important things of banking life as against the urgent ones.

The entire range and scope for new services has been confined to gimmicks like all-night and Sunday-banking. The realities of clearing and collections, pass-books and statements have been totally neglected. As a result, the public sector banking is being discredited on such elementary issues.

Vast scope

. Banking services have a vast new scope, which has remained totally unexplored. Banks have tried to go into tax consultancy and failed miserably. But they have not even attempted to go into financial consultancy which is of the very essence to their working.

As a result of Tandon and Chore Committee information systems banks are required in any case to assess the quality and performance of the financial management of large enterprises whom they lend. Yet banks have not provided them services to develop, compile and implement information, costing, control and communication systems within large enterprises. For these services, the enterprises have gone to chartered and cost accountants and management consultants and paid them fantastic fees. If banks had provided these services they would have earned those incomes. More than that bankers would have come closer to the realities of financial management, would have got better insight into the working of enterprises and would have been better able to supervise their borrowers.

As it is, bankers lost both, the incomes and the opportunities. Further since cost and chartered accountants started doing the figure work and presentation of accounts, bankers' ability to read, interpret and use the data remained very stagnant. The faculties and talents which they should have developed remained very much in abeyance. The final stroke was added by the lack of time about which bankers have started pleading. Since they had no time, they did not read their customers' statements. The information system has failed both because customers did not submit information, as also because bankers did not read it.

There is yet another area in which bankers have failed to provide a new service which was very much required. When management of industrial enterprises was simple, their managements used to depend upon bankers for financial management expertise. But as the complexities and subtleties of financial management increased, industry started employing professionals, accountants, MBAs, lawyers. As the expertise increased within the enterprises, bankers' role in advising on financial management started declining. Eventually, banks have now come to a stage where they have become totally irrelevant to the financial management problems of the enterprises.

Priority sectors

Bankers' funds are now increasingly being committed for priority sectors and in meeting liquidity and reserve requirements of the RBI. As a result the share of industry in bank lending is declining. In fact, the RBI, Government and banks have been declaring as a matter of policy, that industry should not look to bank funds and should raise its own funds or generate them internally in an increasing manner. Thus, as their reliance on bank funds declines, they will become increasingly independent of bankers also who can provide neither funds nor expertise.

As bankers' earnings from loans to industries decline, they could increase them by providing increasingly more and more services and charging for them. But this can be done only if the bankers have better financial management expertise than that possessed by industry. But so far, bankers have not shown any evidence of their ability to do so.

Thus, in the entire range of new services and innovations, bankers have made a miserably poor show. The future lies with those banks who can offer better services.

Total indifference

Bankers have become experts in stating their performance goals and declaring that they are taking several measures to achieve them. But they are very poor in assessing the effectiveness of their measures and in evaluating the results actually achieved. Thus right from the Government and RBI to the smaller bankers they all take several measures, but none of them care to evaluate them by comparing whether the objects for which they were taken are realised or not.

Take the simple case of overtime in banks. All of them from the Government to the smallest person in banks are convinced that overtime is abused and demoralises people. Banks spend Rs 31 crores on overtime a year. Many steps are taken to control it. Yet it goes on increasing. Take another instance of cash in the banking system. The RBI is generating more new notes a month than the soiled notes it can destroy in a year. As a result there is no vault space for notes, remittances of cash are costly and cash ratio of banks is high. Banks lose interest on unwanted high cash they accumulate to the tune of Rs 800 crores a year. Yet the ingenuity of bankers has not been able to create 2,000 currency chests at every taluka centre in the country.

The RBI credit policy is another instance. The declared objective of credit policy is to contain inflation, curtail speculative uses of credit, and promote productive uses. Many things are done in the name of these credit policies—and none of them are successful in achieving their objective. Yet that does not seem to matter. The central bank authorities seem to think: "Whether the objectives are achieved or not is a different matter : but we must take the actions with the ostensible objective of achieving them."

The profitability of banks is under pressure. Cost structure is high, systems and procedures clumsy, and there is lot of wasteful and duplicate work. Yet bankers are primarily concerned with complaining about their thin margins on funds. Very few of them have the vision, insight, courage or conviction to change the systems and procedures to curtail costs or promote efficiency.

The main function of a banker with reference to a borrower is to understand his needs and problems and promote his productive activities. This is the essence of bank lending and of the personal relationships in banking. Yet, the reality is that the banker has no time to understand, let alone time to help the borrower. Bankers give appointments that they do not observe. They keep their valued customers waiting for hours in their parlours. What is worse, their customers have to wait for days together for obtaining even such a worthless appointment.

Even when the appointment does materialise, the customers find that bankers have not read the papers and have not done their homework. Very often the papers are not traceable. A querry is raised at the slightest pretext and the appointment ends unceremoniously to await a similar fate later in the second round.

Borrowers have become so used to these ways of the bankers that no one ever raises a question about such arrogant behaviour of bankers. During such meetings, no decisions are taken (we will consider and let you know later!) before weeks if not months! Even if decisions are taken, they are not recorded or confirmed. They are sacrosanct.

It is no longer a banker's problem whether he helps the customer to obtain a good result or whether he destroys all opportunities for doing so. A fruit processing industry unit has a long record of inadequate production, and accumulated losses. At long last, times have changed and it is getting LC after LC from foreign importers. But the bankers have now lost faith in him. When the banker should have been alert and should have restrained the borrower, he was not even aware of what the borrower was doing and how he was accumulating losses. Now when the borrower is turning the corner and is in a position to generate cash to repay the banker, the banker has woken up to the realities of past years. But he is able to see only the past, not the present and future. Even if the borrower had made losses in the past, to-day he is able to generate large amount of surplus cash. But the banker has allowed a specific packing credit of Rs 3 lakhs against LCs of Rs 17 lakhs—not even a revolving packing credit.

If the borrower questions, how he can produce, the banker argues: "It is not my problem. You may or may not be able to produce goods. But I will not give you packing credit, because you have made losses in the past. Even if you can produce and sell now at a profit, I do not wish to take the risk."

The situation is so upside down that bankers keep on financing when the losses are made and stop doing so when the borrower is in a position to earn profits and wipe out the past losses.

Similarly in a synthetic weaving enterprise. The entrepreneur has made huge losses due to past follies—at that time the banker went on financing him merrily. Now when he has started paying interest and instalments from profits of Rs 6 lakhs a year, the banker has become restrictive. He argues, "Why should I take the risk of financing you?"

The bankers have a much larger stake in both the enterprises, and would recover their bad loans if they were to lend wisely now. But the bankers don't care if the losses continue and the enterprise is destroyed—their only concern is that they do not wish to take risks.

Part of the weakness lies in their system of credit supervision. Since bankers have lost the art of supervising credit well, they are not confident that they will be able to recover what they lend now, although their chances of doing so are much better now than before. This therefore brings us to the question of monitoring and supervising lending.

Monitoring and supervision of loans

Among the many contradictions of nationalised banking is this conflict and dichotomy between theory and practice. All bankers talk of lending now against productive potential and not against security. But none of them have the courage or conviction of lending against productive potential if they do not have the security.

This is because they do not know the art of supervision. All of them still rely on monthly stock statements and details of debtors and creditors. If they were to shift from this to the simple daily reporting of sales realisation, variable costs, contribution, and net surplus, and monthly data on turnover and age distribution of stocks, debtors and creditors, they would have a much better control over their borrowers.

But bankers do not have the time the understanding and the patience. The old breed of a challenging banker who was able to recover Rs 7 lakhs by advancing Rs 5 lakhs is no longer there. Today's young bankers specialise in lending Rs 7 lakhs to lose Rs 10 lakhs and in refusing Rs 5 lakhs when the chance to recover Rs 7 lakhs does arise.

These are the internal problems of nationalised banking that should be subjected to greater attention and debate on this anniversary date rather than concentrating on physical achievement of branches, accounts and amounts.

Customer service and bank marketing

By S. G. BAPAT

BANKING as a service industry is a matter of great concern to almost everybody. With nationalisation, quite naturally, public expectations have increased. One one side, the customer of the bank is expecting a lot, while the bank managements in general have been very conservative. A recent news item (July 12) says—"The approach of many bankers so often continues to be overcautious, their procedures very difficult to follow and perhaps, even the policies laid down by managements fail to either percolate to the lower levels or get translated into the right spirit". The quotation is from the speech by Mr N. D. Tiwari, Union Minister for Planning and Labour, at the time of convocation at National Institute of Bank Management.

The Banker, a leading journal, puts a cover feature: "Its high time, bankers take the bull by horns" (See May 1981 issue). It is very clearly expressed that the first and foremost weakness of banking industry is deterioration in customer-service in banks. Banking is essentially a service industry and it has to sustain and grow on the quality of service. The survival and growth is actually influenced by the ability of the banker to render qualitative services to different classes of customers rather than the volume of business. It is really a matter of concern that even professionalisation of bank managements has not made any perceptible change in the level of customer service.

It is not a very uncommon experience for the customer to be tossed between the counters. It is wellknown and oft repeated that there are three basic parameters of good customer service, namely, (i) courtesy extended to the customers whenever they are on the bank/branch premises; (ii) the transactions should be handled as speedily as possible; and (iii) helping attitude and accuracy in transaction. How far the customers are happy with reference to these three aspects is anybody's guess. It has also been mentioned quite aptly by the Talwar Committee that the assessment of customer service of banks should take into account the four factors namely, (1) demands on and expectations from banks; (2) quality and job knowledge of bank personnel; (3) attitudes and motivations of bank employees; and, (4) back-up systems and procedures.

The report was submitted on March 31, 1977 but there are hardly any visible signs of implementation of the recommendations seriously, for example, recommendation No. 73, "The problem of collection of outstation cheques should be tackled on the national level. The eventual objective in this regard should be to develop a system and structure for national clearing for which purpose a national clearing authority may be set up immediately". Or take the case of recommendation No. 78—"Customer should be reimbursed for loss of interest and commission/charge if any should be waived in case the credit on account of cheque/bill sent for collection is unnecessarily delayed due to banker's fault." This recommendation is also not being taken seriously.

Usually, the bank managements accept the allegation about deterioration in customer-service while trade unions maintain silence on the issue. It appears that there is a feeling of helplessness. The staff complains about inadequate manpower and growing workload. In addition to the volume of business, complexity of functions has also grown. It is also argued:—"Bank staff cannot be immune to the happenings in surrounding environment. Since the standards of service are deteriorating everywhere, banks cannot be an exception." Some of these points are understandable but certainly these are not acceptable. Thus, it is obvious that unless the awareness of "customer-service" is consciously built up, there will be little hope for growth or even survival.

One more reason why urgent attention should be given to the aspect of customer-service is that in recent years the profitability of commercial banks is declining. From June 1969 to March 1980, branch offices increased from 8,300 to 31,900. Deposits have increased from Rs 4,650 crores to Rs 31,690 crores. The advances have increased from Rs 3,600 crores to Rs 21,450 crores. It is true, that the gross income has increased but ratio of net profit to income has decreased. The following table will illustrate the point.

Per cent ratio of net profit to income

Year	Nationalised banks (14)	Private sector top 13 banks	State Bank Group
1968	3.23	2.33	3.19
1970	2.59	2.89	2.23
1975	1.69	2.20	1.65
1977	2.20	2.03	1.31

One need not go into the causes of decline in profitability. One obvious reason is "low productivity in the banking sector (viewed in terms of quality of service)". The staff is definitely capable of much better performance.

Better bank marketing

The word "bank marketing" may create initial resistance in the mind of conservative and overcautious banker. Unfortunately, there has not been a unified and organised effort towards "bank marketing" as such in India. Even individually, much attention on regular basis has not been given to bank marketing and customer service aspects. One of the reasons may be that all these years, banks have been operating in the sellers' market. Perhaps, banks had ready customers and large waiting lists. However, things are definitely changing very fast. In an article "Banking in the Eighties" (*Journal of the Institute of Bankers*/April-June 1980) it is particularly mentioned that competition for deposits would be particularly intense during the next decade. The bankers are bound to compete with each other for deposits. There are large number of advertisements of the corporate sector attracting attention to the lucrative rates offered on deposits. Naturally, therefore, the ability to convert external environment into economically viable propositions would be the prime task for 1980s.

It is not very clear whether the top managements in banks have thought of bank marketing in serious terms. There is a ray of hope because a few articles are being published on "Need for Bank Marketing" or "Marketing muscle for money managers", etc. It is true that more detailed and comprehensive literature on "Bank

---

Dr Bapat is professor in Brihanmaharashtra College of Commerce and a director of Vidya Sahakari Bank Ltd.

marketing" is awaited, but the top management can and should initiate discussions on various innovative ideas.

At this stage, it may be worthwhile to note the difference between "selling" and "marketing". If "selling" would mean a routine function of rendering existing services to existing customers, the term "marketing" would in addition, cover innovative ideas of new services to existing customers and new services to new customers.

Marketing has been rightly described as the beginning and end of all the productive activities. Theodore Levitt has said "the primary business of any business is to stay in business and to do that you have to get and keep the customers". The concept of marketing can be appreciated as "a corporate approach to identification or creation of customer demand, followed by the provision and selling of the relevant goods and services at profit". On the same lines, bank marketing may be defined as "identification or creation of customer demand followed by provision and selling of customer–satisfying services as the key to achieve bank's corporate objectives".

If top management takes sufficient interest in 'bank marketing', staff can be educated to give due attention to "customer service". "Customer is the most important visitor on our premises... He is not an outsider on our business, he is part of it... We are not doing him a favour by serving him. He is doing us a favour by giving us an opportunity to do so". All these slogans which are already acting as wall decorations in bank offices today may get life and the staff may be better informed and better motivated.

Customer-service is only one aspect of bank marketing. Bank advertising should also be more imaginative. Advertising should be regarded as communication arm of marketing. In one of the surveys conducted on bank advertising, customers have expressed their media preferences as radio, TV, short films, personal letters, posters and others (like newspapers, magazines, folders, calendars, bus and railway tickets, etc). When the specific question was posed. "What do you expect from the banks in the near future?" The answers are :—collective advertising, more purposeful advertising, more advertising budget and better goodwill. Banks should carry out independent studies on regular basis to study the reactions of customers and prospective customers.

Such type of studies will help the bank marketing managers in two respects : (a) To locate the points where customer-education is required. (Personal counselling and advertising may be so planned that customer will be properly educated). The sources of dissatisfaction or misunderstanding can be located in time and effort can be made to remove misunderstanding etc. (2) To locate the points of staff training in relation to customer service.

In modern times, effort is made to locate the problems and classify the solutions into two parts : (a) Training solutions and (b) non-training solutions. Bank managements can use the studies of "customer service" and plan its training activities to train the staff through case studies and role playing etc. This type of training is likely to be more meaningful.

In 'bank marketing', various other aspects will also have to be considered, namely, market segmentation, product differentiation and market strategy. Market research on continuous basis is no doubt very useful. Fortunately, a lot of valuable record is available with the banker. It should be used for market research.

In any case "customer satisfaction" is the central theme in bank marketing and hence in order to meet the challenges of 1980s, bank marketing activities should be adequately planned and implemented.

Need for restructuring of banks

By B. RAMACHANDRA RAO

THE banking system in the country has been growing rapidly since the nationalisation of the 14 major scheduled commercial banks in July 1969. Branches of scheduled commercial banks increased to 33,103 as in September 1980 from 8,262 in June 1969. Of the new offices, more than half were opened in unbanked centres. The average population per bank branch declined from 65,000 to 17,000 as at the end of December 1979. While opening branches, care was taken to see that more licences were granted to open branches in backward districts so that there could be equitable distribution of bank branches in the country. In 1970-71 there were 85 banks in the country with 11,541 offices. The figure of offices rose to 29,757 in 1978-79. It shot up to 31,889 during 1979-80. The present figure is in the neighbourhood of 34,000. But still the coverage is not complete. Even if we open one branch for every 20 villages, it will take another 50 years to cover the entire country with bank branches.

In June 1969, the aggregate deposits of the banks were at Rs 4,646 crores only. As on June 5, 1981, the deposit figure has crossed Rs 39,000 crores, which is no small achievement. No doubt, however, compared to the population of 68 crores in the country, there is still a lot of leeway to be made up in the deposit mobilisation efforts by the banks.

Coming to the advances, the figure was only Rs 3,599 crores in June 1969. The present figure in June 1981 is at Rs 26,178 crores. With so much credit being in deployment, one can easily visualise the extent of economic output/wealth created by this investment in the country. Banks have now started the credit camp approach to go to the borrowers and disseminate credit for maintaining a balanced credit deposit ratio in places where disparities exist particularly in the priority sector lending.

In the area of priority sector advances also lot of headway has been made by the banks in the country. Table 1 will reveal the progress made in this area between 1969 and 1979.

In 1969, the total of priority sector advances constituted just 14.9 per cent of the total advances and in December 1979, it had shot up to 34.4 per cent. These advances carry comparatively lower rate of interest and to that extent the banks are sacrificing their profitability in the interest of the socio-economic development of the down-trodden neglected and weaker sections of the economy.

In order to re-shape the priority sector lending and in view of the importance to the 20 Point Economic Programme, a working group headed by Dr K. S. Krishnaswamy, the then Deputy Governor of RBI, has recommended the following sub-targets in the weaker sections under priority sectors to be achieved by the nationalised Banks :

1) 40 per cent of total lending to priority sector and at least 16 per cent of the total advances should be to the agricultural sector by 1985.

2) The direct advance to weaker sections should reach level of at least 50 per cent of the total direct lending to agriculture including allied activities by 1983. The weaker section in the agricultural sector would comprice:

(a) small and marginal farmers with land holdings of five acres or less and landless labourers;

(b) persons engaged in other allied activities where borrowal limits for such activities do not exceed Rs 10,000.

3) All small scale industries with limits upto and inclusive of Rs 25,000 should be treated as the weaker section in this category. Advances to this weaker section should constitute 12.5 per cent of the total advances to small scale industries by 1985.

4) Banks should strive to even-out the regional imbalances in the deployment of credit in the best feasible manner by formulating suitable viable schemes in consultation with state development agencies for all the beneficiaries identified under the 20-Point Economic Programme.

Coming to the differential rate of interest scheme, it has come to stay to help the people coming under the purview of weaker and neglected sectors of the economy. As percentage to aggregate advances, credit under DRI scheme rose from a mere 0.02 per cent in 1972 (Rs 87.3 lakhs) and 0.94 per cent (Rs 140.96 crores) in December 1979.

The banking system in the country comprises the following group of banks as on June 1980 and the number in each group and branches they are having are marked against each group :

	No. of banks	No. of branches
1. State Bank of India	1	5,293
2. Associate Banks of SBI	7	2,447
3. Banks nationalised on 25-4-1980	6	2,726
4. Nationalised Banks	14	15,356
5. Regional Rural Banks	73	2,678
6. Other scheduled commercial banks	33	3,724
7. Foreign Banks	14	129
8. Non-scheduled commercial banks	5	66
9. All scheduled commercial banks	148	32,353
10. All commercial banks	153	32,419

Table I : Priority sector advances

(Rs in crores)

	June 1969	December 1979
1. Agriculture		
(a) Direct Finance	40.21	2,004.57
(b) Indirect Finance	122.12	557.55
2. Small Scale Industries	251.07	2,322.54
3. Road Transport Operators	5.49	446.38
4. Retail trade and small business	19.37	473.50
5. Professional and Self-employed persons	1.91	133.79
6. Education	0.80	8.65
Total	440.97	5,946.98

NEW BANK OF INDIA
(An Undertaking of the Govt. of India)

Head Office:
1-Tolstoy Marg, New Delhi-110 001.

Out of the above 32,419 branches as on June 1980, population group-wise distribution of banks' offices can be seen in the following table :

	No. of branches	%, to total
Rural	15,101	46.6
Semi-urban ..	8,078	24.9
Urban	4,856	15.0
Metropolitan/Port Town	4,384	13.5

Particularly for the past 1½ years, the branch expansion has been going on steadily but slowly, the prime reason being lack of personnel for new branches. The service boards take a long time to give the hands and the banks have no power to recruit permanent hands themselves. Old branches are becoming understaffed when hands are removed to open new branches. It is high time that either the BSRBs should function quickly and effectively to give hands to the banks on demand or against indents or the entire recruitment should go back to the banks only to make expansion really meaningful and to be done with the time horizon.

Apart from the above banks, the system also includes the following institutions :

1) Co-operative banks

2) Post office savings banks

3) Agricultural Finance Corporation

4) Agricultural Refinance & Development Corporation

5) Other term lending institutions such as IFC, SFCs, SIDCs, IDBI, ICICI NIDC, IRCI and NSIC

6) UTI & LIC

7) Proposed Exim Bank to handle foreign exchange business

8) Proposed NABARD to help agricultural development in the country.

Taking the commercial banking set up alone as described above, it is felt that the number of banks in the public sector which is now 28 is too large and they may not be able to deliver the goods as expected of them as efficiently in the future years. While very few banks have taken to innovative banking going off the beat and track of traditional banking, many are still seeped in money lenders' activities, talking still in terms of security and no risk to be taken for advances. Because there are many bank branches in the same places, unhealthy competitions are going on and what is really needed is competition in service which is very rarely seen. Banks should diversify their activities and merely selling old wine in new bottles is no good. There is plenty of scope in merchant banking activities for the banks and some banks can even take up deposit management for companies.

Bigger branches in the cities due to their size are becoming inefficient to impart quality service. Some banks are, therefore, trying to reduce the size of their bigger branches by shifting foreign exchange, SSID, SB Accounts etc to separate branches exclusively handling each one of these functions.

Ever since the nationalisation of the further six banks last year, there is a move to demand the restructuring of the banking system in the country to deliver goods effectively and efficiently to the public. This year there was a banking seminar also in Baroda organised by the RBI to discuss the restructuring of the banks in the country. So many experts and others have suggested several models of restructuring. The solution is not simple. The existing banks themselves do not want to lose their identity. But, however, the RBI and the Government are keen on reducing the number from 28 to a minimum of six or so. There were reports sometime back that RBI has already cleared a plan of restructuring and now the whole thing is with the Government awaiting clearance.

But it may be mentioned that structural changes of the banking system alone cannot bring about the desired results. For good result and performance, the spirit of service, the involvement in the job, the sense of belonging and the job satisfaction of the employees are badly required in the present context of agitational approach of bank employees all over the country in one form or other, affecting productivity and rendering disservice to the clientele. Unless these good virtues are ensured amongst employees, qualitative growth of banking is not possible and structural changes may only facilitate quantitative growth with downward trends of productivity and profitability year after year. If employees can take a pledge that 'no challenge is too big' to play a dynamic role for them, banking is bound to witness a revolutionary change in the country both in contents and in the manner of functioning.

Savings through banks

By V. PRASANNA BHAT

IT may look paradoxical and also odd elaborating on 'Why should you invest in bank?' when people are in fact asking 'why the hell should we invest in banks?'. But then, despite the growing dissatisfaction with the services rendered by the commercial banks and also the not so attractive returns on deposits offered by them, when compared to other avenues like company deposits, the banks have been doing an apparently marvellous job of mopping up public deposits. These commercial banks are currently adding Rs 5,000 crores to Rs 6,000 crores per annum to their existing deposits and this works out to 70 per cent to 80 per cent of what they had in all (aggregate of bank deposits) at the time of nationalisation in 1969. However, this is not to justify the nationalisation of banks.

Over the past decade there have been a variety of competitors with numerous attractive schemes seeking to mobilise public savings and they are offering a stiff competition to banks in mobilising public deposits. Mention-worthy among them are public and private companies, chit funds, Unit Trust of India, company shares etc. Of course, government bonds, post office certificates, Life Insurance Corporation and other trustees securities and debentures do mop up a large chunk of surplus with investing public due to the inherent tax and statutory benefits they offer.

A discussion as to 'why invest in bank deposits' is relevant in the present context, especially since even many bank managers are not fully aware of the plus points in favour of bank deposits. It may not be surprising to see even managers of commercial bank branches privately making critical comments and observations against bank deposits in comparison to company deposits and chit funds.

In spite of these odds against bank deposits, if the banks are continuing to flourish it is due to quite a few subtle yet significant advantages provided by them. Investors look for safety, security, liquidity, accessibility or proximity, tax benefits and convenience apart from the rate of return. Few decades ago interest was the only reason for which money's liquidity was parted with and there were authors putting forth theories of 'interest' on the basis of liquidity preference alone. But now, the times have changed and liquidity preference is just one of the several factors taken into consideration for deciding the rate of interest. Furthermore, interest is not the only consideration for the savings are deposited or investments are made and the reasons are very many. It makes an interesting analysis to view the public deposits with banks from each of these angles.

Safety: Bank deposits are safe. Chit funds have become proverbial 'cheat funds'. Instances of companies failing to refund the public deposits have been reported and are on the increase. It is a pity that even Reserve Bank of India or Central Government cannot make the defaulting company to repay the amounts to depositors with the existing provisions. The pathetic depositor can seek remedy through law and legal measures only. Certainly a depositor does not wish to be deadlocked in a legal battle, with a company which is a costly proposition and highly time consuming. Of course, from the date of decree the depositor gets the paltry rate of return on his investment, namely the court rate. It is interesting to note that, to protect the interest of small investors insurance cover is made available by a Deposit Insurance Scheme. DICGC covers bank deposits upto Rs 30,000 in individual cases and the premium for such coverage is met by the commercial banks. Not that deposits above Rs 30,000 are unsafe in banks; if it is a scheduled bank Reserve Bank takes care of the depositors' interest. This unique protection of insurance accorded for deposits is not available in any other type of investment.

Security: A scheduled commercial bank is fully controlled by the directives of the monetary authority namely Reserve Bank of India, lest the bank squander its resources. The banks are not only inspected by the internal auditors of the banks but also by the Reserve Bank officials and statutory auditors, which ensures proper supervision and control including proper investment of the resources mobilised by the banks. Further, nearly 40 per cent of the bank's deposits are made to be invested in trustee securities, bullions and with Reserve Bank in their interest free current account, thus ensuring a good security and liquidity from the point of view of investing public.

Liquidity: Bank deposits are always considered as liquid assets. While banks are obliged to maintain liquidity as per statutory stipulations (like SLR and NLR), the investing public too are paid back their deposits in cash whenever demanded or contingency arises. The facility of obtaining a loan against a bank deposit and the advantage of premature closure of a term deposit (with a reasonable period of notice) does not exist in the case of company deposits and debentures. Though the bank interest is slightly lower, the facilities of a deposit loan or a premature closure guarantees liquidity of the bank investment. In many companies the repayments are not promptly made on due date and there are cases where the investor has lost the complete investment itself.

Accessibility and proximity: Thanks to the mass banking concept, the banks have spread their network of branches even to inaccessible villages in India. In comparison to company deposits or debentures the proximity and accessibility available in the case of a bank branch is far more and hence convenient. The head office or registered office of a company is usually far off and the investor is usually made to deal with such companies through the medium of postal communication. The commercial bank manager is normally available for discussion with the public in the matter of investments and is usually trained in offering the appropriate counsel.

Tax benefits: While the fact that interest income on bank deposits upto Rs 3,000 per annum is exempted from income tax is a well known concession, there is yet another concession which is not so well known. Bank deposits up to Rs 1,50,000 are considered as a specified financial asset qualifying for exemption under Wealth Tax as against company deposits which are fully chargeable under Wealth Tax. Another disadvantage in the case of company deposits is that income tax is deducted at source if the interest payable on such deposits exceed Rs 1,000 per annum and therefore the investor is inconvenienced by seeking the refund thereof at a later date. Interest on bank deposits can be drawn at convenient frequencies and also quarterly compounding is admissible if the same is allowed to be accumulated under a scheme. The compounding facility is not normally available in company deposit schemes.

Convenience: The various bank deposit schemes are tailor made to suit the convenience of the investing public and can be suitably matched to the saving capacity of the individual. Deposits rang-

---

Mr Prasanna Bhat is manager, Karnataka Bank Ltd.

ing from daily collections to term deposits upto ten years are available only in the case of banks. Cheque facility is available for saving deposits and the procedures are simplified affording operational convenience. For large depositors banks offer free services like remittance, carrying out standing instructions like payment of LIC premium, electricity and water bills. Such other agency services like acting as attorney or trustee etc, are available for bank depositors. The facility of lockers is also afforded to bank depositors.

It may even be argued that banks invest in schemes and such projects as envisaged and directed by Government and Reserve Bank of India or rather bankers deploy their resources as per stipulations of national priorities percolated down to branch levels through credit plans. However, this does not interest very much the investing public as they are concerned mainly with the above points apart from the rate of return on their savings and investment

Cultivating banking habits helps the nation in generating wealth and employment. Despite, the apparently appreciable progress made on the banking front during the last decade our *per capita* bank deposit is far less when compared to international standards. It may also be surprising to note that only about thirty lakh people in India have company shares. While the capital shyness of Indian investing public is understandable due to the taboo attached to the word 'share' and also due to the lack of education, there is no reason why the concept of mass banking should not make the desired impact on the investing public.

Our banks have to go a long way in getting closer to the investing public and also in the matter of inculcating the banking habits. No doubt, too many restrictions and restraints on the banks by the monetary authorities and the Government have made it really difficult for the banks and they have been deprived of the benefits of healthy competition and the needed independence for expanding in a bigger way. The present growth is commendable when compared to the restrictions and the impediments. A bank deposit is far beneficial and dependable for any middle class or poor class investor and in order to convince such an investor from being misled by the lucrative interest factor alone (offered by a company or chit fund), a bank manager must be fully conversant with advantages accruing from a bank deposit.

Financing expansion: Banks or financial institutions?

By G. J. KHUDANPUR

IN the past decade or so, as a consequence of inflationary rise in prices, the project costs have shot up to such an extent that it is well nigh impossible for any of the existing companies, whether government or non-government, to finance their expansion programmes without substantial external financial assistance. Published data regarding capital raised (paid up) under consents/acknowledgements of proposals by both non-government and government companies clearly demonstrate a steady declining trend in (paid up) capital raised.

In the case of non-government companies the total capital raised during 1979 at Rs 200.6 crores was lower than Rs 258.0 crores raised during 1978. The decline was shared by all the instruments of capital issues. The trend continued in the first half of 1980 as well, during which period non-government companies raised Rs 74.0 crores as against Rs 114.1 crores raised during January-June 1979. A similar trend was noticeable in the case of government companies also. The total capital raised by government companies during 1979 aggregated to Rs 43.4 crores as against Rs 55.9 crores raised during 1978, showing a decline of 22.4 per cent. Similarly there has been a substantial decline in loans — other than those granted by public financial institutions, banks etc, — which are exempted from control of capital issues. Hence companies, whether government or non-government, have no alternative but to resort to borrowing from either banks or the public financial institutions.

Selecting a financing agency: A variety of considerations influence the choice of a financing agency by a company. Availability and cost of credit, a degree of supervision exercised by the financing agency, ease of operation of the account are some of the important considerations. However, availability continues to be the most important single factor.

Since public sector units and cooperative units have relatively secure sources of finance for "approved" programmes of expansion, attention will be focussed here primarily on the problems of units in the private sector only.

Availability of credit: Availability of credit is a function of many variables. It varies with the size of the unit (large, medium, small or tiny), location of the unit (developed area, backward area), type of activity (priority sector or non-priority sector) and the type of unit (existing or new). The purpose and duration of the loan and the existence of special schemes of finance are also important factors influencing availability of credit.

Medium and large companies: In spite of much flaunted official policy to promote small scale industry, medium and large scale industries have expanded much more rapidly. They are also the principal beneficiaries of finance, both direct and indirect, provided by the term lending institutions. A principal factor has been the availability of financial expertise and close liaison with the top personnel of term lending institutions. Further the ability of such companies to absorb profitably the loans sanctioned and consequently to repay the loans on schedule makes them better security risks. They also have adequate security to offer and borrow large sums and as such they are preferred customers.

The medium and large units usually borrow directly from term lending agencies when the amounts borrowed are large, and indirectly when projects are relatively small but are bankable and eligible for refinance. The reasons for this are obvious. This procedure reduces the time lag in securing loans. They also secure bridge finance from commercial banks against loans sanctioned by term lending institutions.

A scrutiny of data on direct financial assistance sanctioned and disbursed by IDBI, IFC, and ICICI reveals that while the amounts sanctioned show a steady increase from Rs 544.4 crores in 1977-78 to Rs 725.1 crores in 1979-80, disbursements have not kept pace with sanctions. However, there was a steep rise in disbursements, during 1978-79 and a marginal decline in 1979-80 (see Table 1).

Data on disbursements to existing as well as new companies are also presented in Table 1. The data reveal that the share of new companies in direct loans disbursed declined from 63.7 per cent in 1977-78 to 35.7 per cent in 1979-80, while during the same period the share of existing companies increased from 36.3 per cent to 64.3 per cent. This is a clear proof of the ability of existing companies to attract more funds than the new companies because of their previous contacts with the financing agencies and their excellent past record regarding utilisation as well as repayment of loans.

What is expansion?

At this stage it is necessary to clarify what is meant by expansion. Normally it is presumed that addition to block capital means expansion. This covers the cases of both expansion of existing units through purchase of balan-

Table I: Direct financial assistance sanctioned and disbursed by IDBI, IFCI & ICICI

(Rupees crores)

Years April-March	Direct loans		Direct loans disbursed to		
	Sanctioned	Disbursed	Newly-established companies	Existing companies

cing equipment, or through addition of a new products line or project at the existing location. However, modernisation presents a tricky problem since it involves reconditioning or even replacement of old machinery. For our purpose we treat modernisation also as expansion. This is all the more necessary as separate data are not available on modernisation.

There is also the problem of new units set up in backward areas by units existing in metropolitan centres. The few studies that exist on locational policies clearly reveal that existing units expand by setting up new units in backward areas to avail of concessional finance under special schemes. In fact, bulk of the new units are organised and set up by the existing units and not by new entrepreneurs. However, for our purpose these are treated as "new" units, rather than as "expansion". From data in Table 1 it appears that in 1979-80 new units secured 35.7 per cent of the finance while old units secured 10.8 per cent of the finance for new projects and 53.5 per cent of the finance for expansion/modernisation of existing units. This indicates roughly the dimension of the problem.

Locational policy

As was indicated earlier, availability of finance is the single most important factor influencing the choice of a financing agency. Taking advantage of this fact an organised and planned effort is being made by the various state governments to attract industries to backward areas of their states by providing concessional finance, and by providing infrastructure facilities (land, water, power, effluent disposal facilities). This has led to certain distortions which have been commented upon by experts from time to time. For instance, Mr M. D. Godbole has noted in his book *Industrial Dispersal Policies* (Bombay, 1978), in Chapter 7 that as a result of concessional finance relatively more capital intensive units have moved into backward areas. Mr Godbole's study revealed that investment in machinery and equipment as a percentage of total fixed capital was higher in developing areas than in Bombay, as was the proportion of fixed capital to total capital. Further labour cost as a percentage of total cost was conversely found to be lower in developing areas than in Bombay.

The availability of state and Central government incentives pertaining to sales tax loan and capital subsidy were considered to be responsible for this phenomenon.

The recent study on locational policy commissioned by the Bombay Chamber of Commerce and Industry and carried out by the Tata Economic Consultancy Services, Bombay also bears out this conclusion (vide paragraphs 5.14, 5.15 and 5.16), if anything, more forcefully. This fact should be noted for future action. For it implies that if employment generation is to be emphasised, then different types of incentives will have to be provided.

Small-scale industry

Unlike medium and large scale industries which preferred to borrow from term lending agencies, the small scale industries showed a distinct preference for bank credit rather than for credit from term lending agencies. This was explained by the fact that small scale industries find banks more easily accessible than the term lending institutions. Also they find it much more difficult to comply with the procedures of the term lending institutions — which appear quite cumbersome to them. The small scale units also find it much more difficult to maintain satisfactory liaison with the term lending institutions. As such they prefer to finance their expansion through loans from commercial banks. The financial assistance to small scale units from term lending agencies such as SFCs and SIDCs is generally availed of by units located in the industrial areas developed by SIDCs. The finance from other term lending agencies reaches small scale units indirectly through automatic refinancing arrangements.

The commercial banks are the most important source of finance for expansion of small scale units. The term lending agencies are also gradually pumping in larger and larger funds. Among the term lending institutions IDBI & SFCs dominate the scene the former being relatively more important (Table 2).

The commercial banks extended to small scale industry term loans amounting to Rs 360.5 crores during 1977-78 and Rs 432.2 crores during 1978-79. The term lending institutions advanced Rs 181.8 crores in 1978-79 and Rs 293.6 crores in 1979-80. Thus it is seen that the term lending institutions are making greater efforts to help small scale industrial units.

Backward areas and new entrepreneurs

Next we consider the problem of financing new units and units in backward areas. In these areas the term lending institutions play a major role. The relevant data are presented in Table 3.

The massive efforts being made by term lending institutions may be seen from the fact that disbursements moved up from Rs 693.8 crores in 1977-78 to Rs 1,262.7 crores in 1979-80 thus recording an increase of more than 80 per cent in two years. The disbursement in backward areas has also recorded a substantial increase.

Similarly the advances to new units and to small entrepreneurs have also re-

corded a handsome increase. In fact more assistance has flowed to new entrepreneurs through term lending institutions than from all other sources put together.

The commercial banks have given highest priority to financing small road and water transport operators. Between June 1978 and June 1979 an increase of Rs 118 crores was recorded in advances to this category.

Conclusions

Medium and large scale units have shown special preference to borrowing directly from term lending institutions. They are in a specially advantageous position to avail of the financial facilities extended by term lending institutions. They use bank loans primarily as bridge finance.

Small scale units prefer bank loans for financing their expansion. This is partly because the amounts are small and the banks are easily accessible. The small scale units in industrial areas find it convenient to avail of concessional finance made available through SFCs. Otherwise they generally avoid term lending agencies because of cumbersome procedures and difficulties in establishing liaison.

Units in backward areas generally take advantage of special schemes of concessional finance offered by term lending institutions. Similarly new units, new entrepreneurs and units from priority sectors avail of special schemes of concessional finance whether offered by banks or term lending institutions. The conclusion is, therefore, inevitable that availability determines the choice of the financing agency.

State co-operative banks: Problem of surplus funds

By G. R. PATIL

WITH a small beginning for mutual help and support based on self-help, co-operative credit societies in the country have grown over the last seven decades into full-fledged co-operative banking institutions with large resources at their command.

In view of the possible impact of their operations on the monetary and fiscal policy of the country, after two decades of regulation of the commercial banks, co-operative banks too were brought under the same piece of legislation by extending to them, from 1966, provisions of the Banking Regulation Act, 1949. While co-operative banks have been thus reckoned as part and parcel of the national banking structure they are yet subjected to differential treatment with reference to dual control at the hands of Reserve Bank as well as the Registrar of Co-operative Societies and also with reference to regulation of their operational policies by the Reserve Bank itself through DBOD in respect of the commercial banks and the ACD in respect of co-operative banks.

This dichotomy in the control and regulation system gives rise to difficulties in the operation of the co-operative banks. These difficulties assume significance particularly in case of co-operative banks in progressive states like Maharashtra, Gujarat etc which have attained a level of growth and progress at which they find it necessary to break new grounds, with reference to both mobilisation of resources as also their deployment. Some of the co-operative banks in the progressive states are, in recent years, faced with the problem of gainful utilisation of their funds.

In the absence of adequate avenues for deployment of resources within their territorial jurisdiction, they are forced to keep the surplus funds with the commercial banks in short-term deposits, side by side with the existence of co-operative banks in the less developed states which are hard pressed for finding necessary resources for meeting the legitimate requirements of co-operative societies.

Thus, for example, over the last five years, the Maharashtra State Co-operative Bank has been compelled to keep large funds in call deposits with commercial banks, the maximum investments for the five years being as follows :

Calendar year	Maximum investment in call deposits with commercial banks (Rs. in crores)
1976	66.5
1977	92.50
1978	35.00
1979	103.95
1980	177.65

Nationwide balancing factor

Faced with this problem, co-operative banks have represented to the Reserve Bank that they should be allowed to break the regional barriers and extend their operations beyond state boundaries so that the co-operative banking complex in the country could emerge as a nationwide balancing centre. This is a mere extension of the idea of the concept of the state co-operative bank in each state as a balancing centre for co-operatives. It is with this idea that the demand for National Co-operative Bank as a federation of co-operative banks in the country had emerged. The added advantage claimed for such an organisation is that, being an autonomous organisation, it would be in a position to work and regulate operations of the co-operative banks in the country with much more flexible approach than the present regulation by the ACD of the RBI, which, as a central banking authority of the country, is obviously biased heavily towards its regulatory role which is bound to prove a handicap to the developmental role of the co-operative which they are expected to discharge.

Another dimension of the nationwide grid of co-operative finance could be financing of national level co-operative federations like NAFED or NCCF which today secure loans from the nationalised banks exceeding Rs 100 crores. Such financing needs permission from the Reserve Bank under Credit Authorisation Scheme. Even here, the Reserve Bank comes in the way of co-operative banks. The nationalised banks secure necessary permission from the DBOD much more easily and quickly than the state co-operative banks which follows a very dilatory approach in granting credit authorisations for financing national co-operative federations. This is the experience of more than one state co-operative bank in the country which provoked their National Federation to protest very strongly against this attitude of the Reserve Bank.

Another solution

Another solution to the problem of surplus funds with co-operative banks would be to seek gainful avenues outside the co-operative sector. Here again the demands of the co-operatives is to extend the scope of their operations to meet the requirements of many government corporations which are also engaged, like the co-operatives themselves, in nation-building activities. Thus, for example, the operations of the electricity boards, or the warehousing corporations or the state transport or the agro industries development corporation, etc are really complementary to the activities of the co-operatives in the direction of rural transformation. It would, therefore, be quite appropriate that the co-operative banks should be allowed to meet the requirement of such corporations.

In Maharashtra alone there are about 50 government corporations, of which just about five or six fall in the category of agro-industrial corporations and hence the willingness of the Reserve Bank, much against its will, to allow co-operatives merely to finance government corporations engaged in agro-industrial activities is not going to lead them too far. This may, at best prove only a palliative just to soften their criticism of the Reserve Bank.

If, therefore, a true solution to the problem of surplus funds with co-operative banks is to be found it is necessary to give up the insistance on adherence to many of the traditional tenets of the co-operative banking policy, particularly with reference to prohibiting business with clients other than co-operatives and arbitrary restrictions about the area of operation on the activities of the co-operatives. Co-operation has now developed from an ameliorative movement based on mutuality into a full-fledged economic system, just like a capitalist or socialist system. We are today planning for financial assistance between co-operative movements, in different countries of the world. It would thus be an anachronism, in this era of global co-operation, to adhere to the unrealistic, regional and sectoral restrictions on the activities of the co-operatives at home.

Mr Patil is chairman of Maharashtra State Co-operative Bank Ltd.

Take a good, hard look at the security you need on your business premises. And see what TES has to offer you.

The security needs of most business houses increase with the increase in the volume of transactions. Valuable deeds, documents, patents and other important papers and files are often locked in steel cupboards or worse still, in wooden cupboards.

Have you ever stopped to think if the present method of storage gives you adequate security? Against fire, burglary or arson?

You can find out how good is the safe you are using now or whether you need better security arrangements through FREE TES Service.

TES Service From Steelage

Steelage offers TES Service—Technical Evaluation of Security. Steelage engineers give you totally unbiased, free rating of the safe you are using now, on various counts of security, including resistance to fire.

As part of TES Service, Steelage also offers free advice on the right choice of safes to suit the quality of security needed—in homes, offices, jewellery shops, finance houses and others.
For high risk areas like banks and large jewellery shops, Steelage offers total planning and installation of security systems with tested, sophisticated devices.

Steelage security technology is backed by the technical excellence of Chubb, the finest name in security equipment in the world.

Commercial banks' branch expansion

The following is the text of a Reserve Bank of India press release issued on the eve of 12th anniversary of bank nationalisation.

THE year ended June 1981, the twelth year of the nationalisation of 14 major banks, witnessed further remarkable progress in the branch expansion of commercial banks. No fewer than 2,773 new bank offices were opened during the first ten months (July 1980—April 1981) of the year. Unbanked centres continued to receive the special attention of banks. Three out of every four new offices were opened in such centres. The number of such offices actually opened was 2,062, against 711 offices opened in banked centres. With the opening of 2,773 new bank offices during the ten-month period from July 1980 to April 1981, the average population per bank office for the country as a whole came down to 19,000 as of April 1981 from 20,000 in June 1980 (based on mid-year population estimates); the average as of June 1969 (before nationalisation) was 65,000.

With the 2,773 bank offices opened during the year up to April 1981, the total number of new bank offices, opened since July 1969 and up to the end of April 1981 comes to 27,668, of which more than half *i.e.*, 15,227 offices have been opened in unbanked centres. The total number of bank offices as at the end of April 1981 was 35,192, against 32,419 in June 1980 and 8,262 in June 1969.

Out of the 2,773 new offices opened during the period July 1980-April 1981, the 28 public sector banks accounted for 1,784 offices, regional rural banks for 762 offices and private sector banks for 227 offices.

Rural centres continued to have a significant share in branch expansion during the year 1980-81. The number of rural bank offices at the end of April 1981 was 17,230 (representing 49.0 per cent of the total number of offices), against 15,101 offices (representing 46.6 per cent of the total) in June 1980. As of June 1969, it may be noted here, the number of rural bank offices was only 1,832, representing 22.4 per cent of the total 8,262 offices.

As in the previous years, the relatively underbanked states accounted for a significant share of the new bank offices opened during the year under review. Following the establishment of a large number of new bank offices in these states, the average population per bank office has gone down in all of them.

The progress made by commercial banks in branch expansion in the past year was in line with the broad objectives of the branch licensing policy evolved by the Reserve Bank in 1978 covering the three years 1979 to 1981. The objectives were opening of additional bank offices in deficit districts (*i.e.* districts in which the average population per bank office, was above the national average of 20,000), in rural and semi-urban areas in order to bring them on par with the national average; a time-bound programme to cover all unbanked block headquarters in the country by bank offices before the end of 1980; establishment of new RRBs and opening more branches of exising RRBs wherever necessary; allowing Lead Banks to open more branches in their lead districts to enable them to discharge their lead responsibilities. These broad objectives have, by and large, been achieved.

A new branch licensing policy, covering a longer period of 39 months from January 1982 to March 1985, is being finalised. The new policy will continue to be strongly biased in favour of opening offices in rural and semi-urban centres. Special attention is proposed to be paid to the covering of unbanked pockets in less excessible areas of different states. While selecting such centres for branch expansion, factors such as potential for mobilisation of different states. While selecting availability of banking facilities nearby, and other special features of the regions will be taken into account. The state governments will be consulted regarding the location of bank offices in rural and semi-urban areas, as well as the types of bank offices (commercial, rural or co-operative) suited for the centres. Priority will be given to RRBs for opening branches in districts where they have been set up or are proposed to be set up.

In keeping with the policy objectives, commercial banks continued to ensure an increasing flow of funds to priority sectors agriculture, small-scale industries, transport operators, professionals/self-employed persons and retail trade/small business. The priority sectors together accounted for advances amounting to Rs 7,999 crores outstanding as at the end of December 1980, against Rs 6,485 crores in December 1979. The share of these sectors stood at 33.7 per cent in December 1980 against 31.5 per cent in December 1979. In pursuance of the recommendations of the Working Group (constituted by the Reserve Bank) on Priority Sector Lending and the 20-Point Programme, the Reserve Bank has indicated the action to be initiated by banks for giving effect to the recommendations. An overall target of 40 per cent of total bank credit has been fixed in respect of priority sectors to be achieved by 1985. Within the priority sector advances, banks have been asked to give increasing attention to the credit needs of the under-privileged sections of the society as identified by the Working Group.

Deposits of commercial banks registered a significant expansion during the year 1980-81. Total deposits as on the last Friday of March 1981 stood at Rs 37,371 crores against Rs 31,759 crores a year before and Rs 4,646 crores in June 1969.

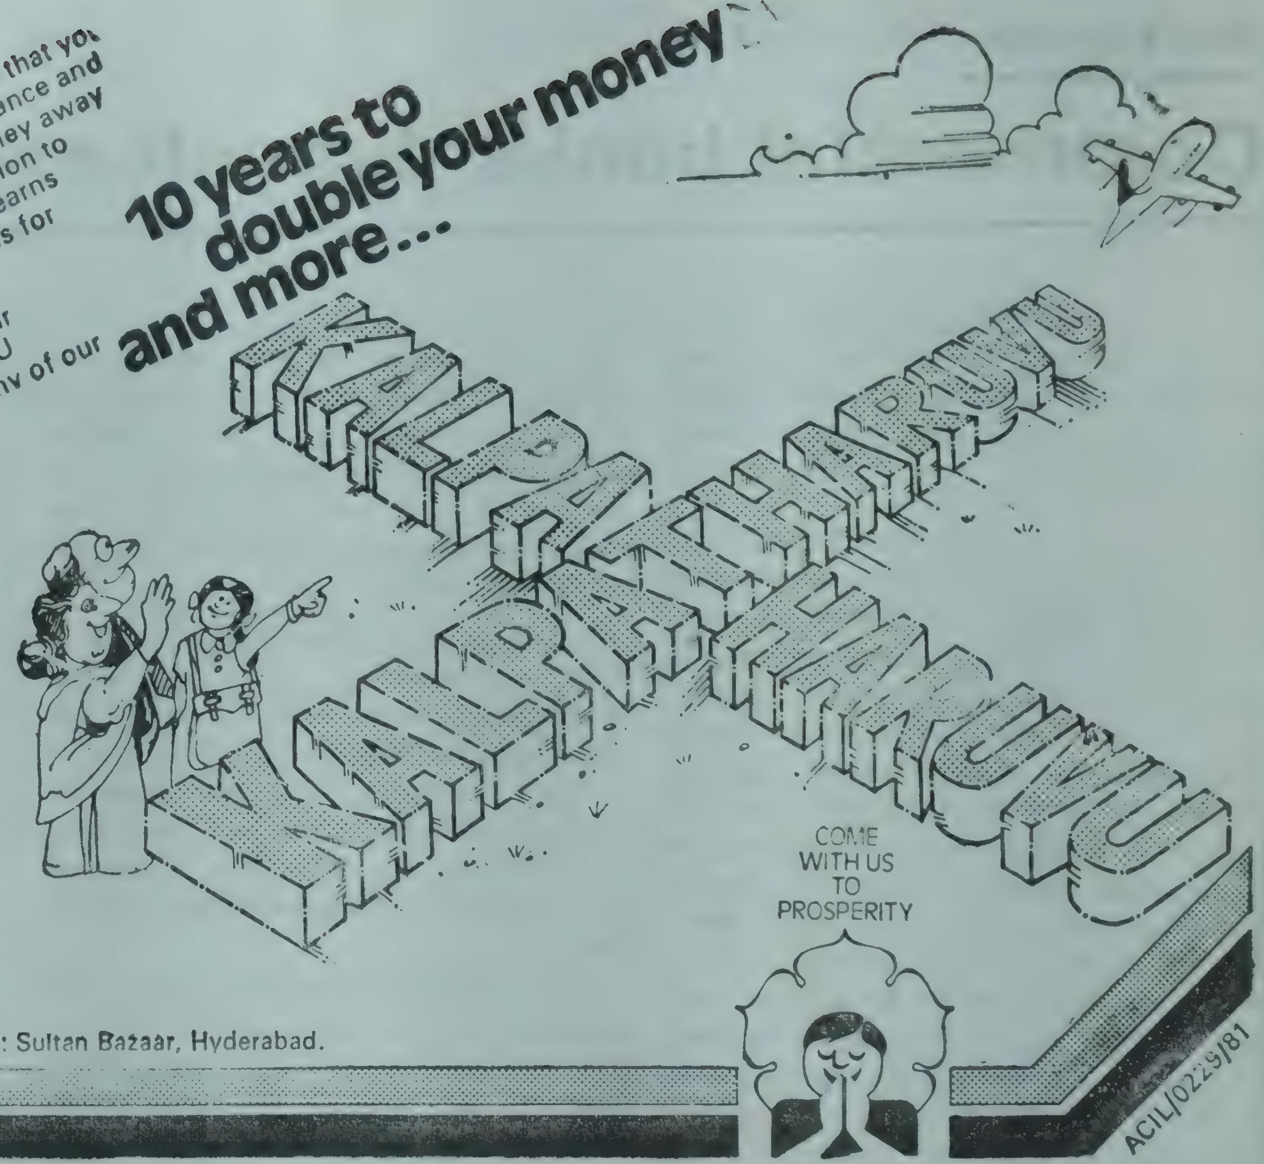
KALPATHARUVU-
offers you
twice the security

Deposit any amount convenient to you in multiples of Rs. 50/-. If you deposit Rs. 100/- for 10 years under the KALPATHARUVU SCHEME, Andhra Bank will pay you back Rs. 268.55. If you deposit Rs. 10 000/- we will pay you back Rs. 26,855/- more than 2½ times your original deposit. The KALPATHARUVU SCHEME was created for you to deposit your lump sums like marriage gift money, provident fund, gratuity, lottery gains, accumulated savings.

The advantage is that you retain a bank balance and still keep the money away from any temptation to spend it while it earns handsome returns for you.

Get details on our KALPATHARUVU SCHEME from any of our branches.

10 years to double your money and more...



Andhra Bank
(A Govt. of India Undertaking) Central Office: Sultan Bazaar, Hyderabad.

IOB CASH CERTIFICATES
An expression of a growing commitment

Ther eare some people with whom you have a lasting relationship. Your parents. Your wife. Your Children and grandchildren. To them you have commitments and responsibilities that grow with time.

IOB cash certificates are a very practical way to express your continuing concern for your loved ones. They help you save for large future expenses, with a small outlay today. Over time they will grow upto three times the value you paid. You can plan to encash them in time to take care of anticipated responsibilities.

An IOB cash certificate that you buy today for just Rs. 372/- will grow to Rs. 1000/- in ten years. Without any further contribution from you. You can buy one for as little Rs. 37.20. Or as much as Rs. 92,800.00. You can encash it in 10 years or just one year.

Drop in at any one of our branches. Five minutes is all it takes to buy an IOB cash certificate.

Maybe we aren't the largest bank, but we do try to be the friendliest.

Come, let's get to know each other, better.

Oriental Bank of Commerce, established in 1943, is one of India's leading nationalised banks. A leader not merely in terms of accounts and amounts but as one which understands what true banking is really all about. To us, banking is people. The cares of people. The needs of people. The money problems of people. And in all these we take far greater interest than any other bank. Do drop in at any of our branches. You'll find out yourself.

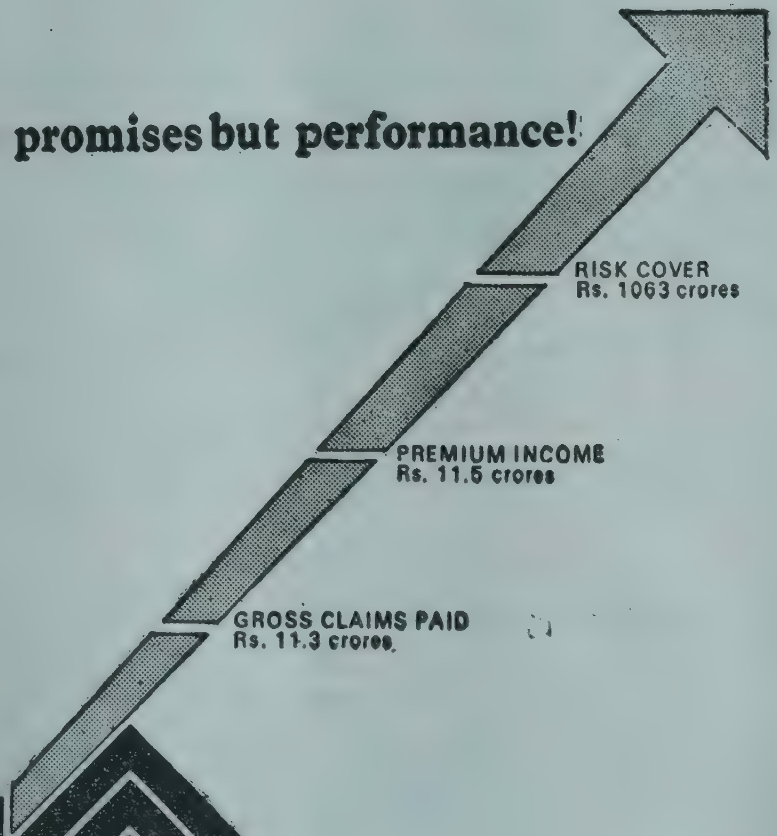
ECGC sets a few more all time records!

Not just promises but performance!



We promised ourselves that we'd go the extra mile for our exporters. And, go the extra mile we did!

Risks covered by the Corporation crossed the 1000 crore rupee mark for the first time in 1980!

Premium income touched a new high at Rs. 11.5 crores.

Gross claims paid in 1980 were a record Rs. 11.3 crores. That means nearly 25% of the total claims paid by ECGC in 24 years of its existence were paid in 1980 alone!

Project and Term Exports covered by ECGC in 1980 touched an all time high of Rs. 1261 crores.

At ECGC, 1980 has gone down as a year of outstanding performance and 1981 portends increasing promise. The time to think export is NOW!

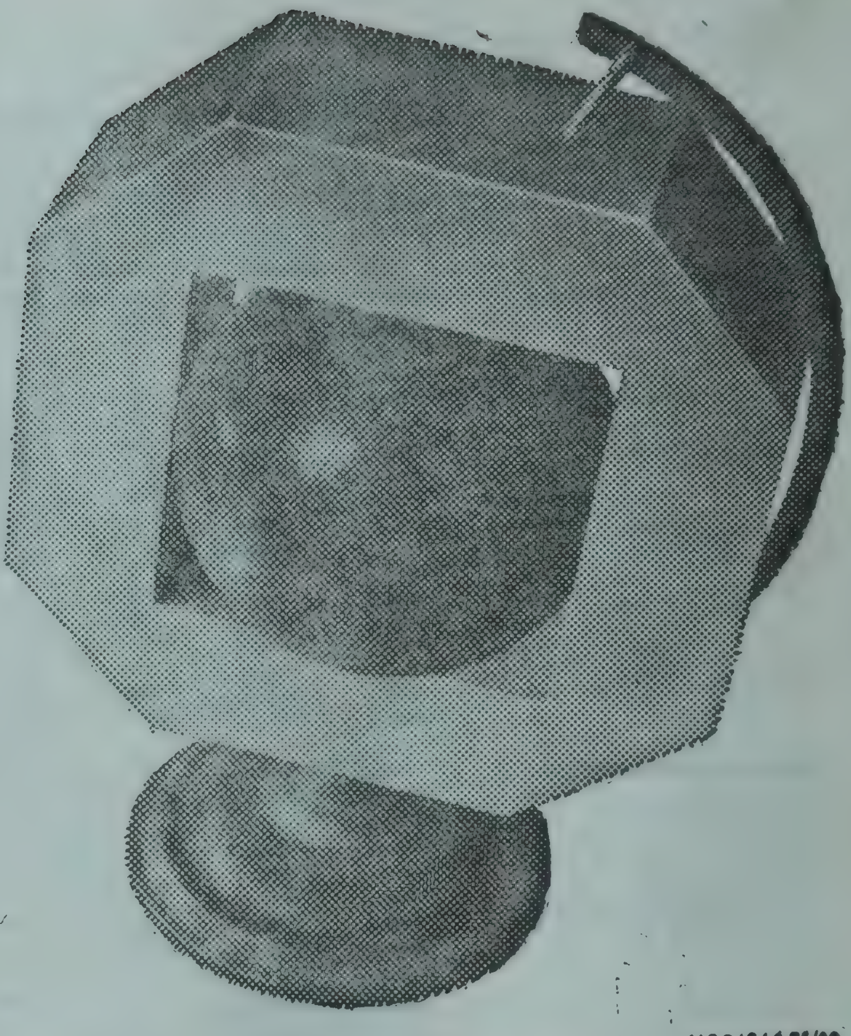
Exporters! Importers!

UCOBANK has your world covered



Export and Import Finance, Letters of Credit, collections & remittances, trade development assignments on your behalf ; in fact, for a world of export expertise and, services—talk to UCOBANK.

UCOBANK's widespread network of branches throughout India and overseas : in London, Singapore, Hong Kong and Correspondents worldwide, are all on tap to provide in-depth information.

Step into UCOBANK today.

There's a specialist waiting to step out and solve your international challenges. Anywhere in the world !

United Commercial Bank

UCO/CAS-75/80

We have a colourful past and a bright future

HERRINGER BRIGHTS

the trusted name for special pigments for plastics

Herringer Brights alone offers the largest variety of colours.

More than 500 pigments for all types of plastics.

ABS
More than 10 lakh Telephones made of ABS with our JET BLACK EX-70 pigment.

ACRYLICS
Bright, opaque, translucent and transparent pigments for sheets and fancy items.

POLYTHENES, POLYSTYRENE, PVC
High tension PVC cables (To ISS-6746/1966), Leather cloth, Pipes, Radio cabinets, and hundreds of other items.

SYNTHETIC PEARL PIGMENTS
Major breakthrough in the field of crystallography. Hexagonal pearl crystals, achieved entirely through indigenous research.

METALLISED POLYESTER FILM
Special Dyes for Coating (Jari).

Herringer Brights Research Institute engaged in applied research and product development since 1973

ACHIEVEMENTS

HERBAL INSECTICIDE
for agricultural and domestic use. Ecologically the safest.

MONOFILAMENTS
Yarns, Mosquito curtains, chair cloth and nawars.

FRP/EPOSXY
45 Pigments Rooflite sheets, furniture, suit cases, boards, auto-parts, sanitary wares, helmets, etc.

POLYPROPYLENE/POLYCARBONATE AND NYLON
High heat stable superior pigments.

IDEAL SECURITY PAPER
To restrict forgery of BANK CHEQUES, DRAFTS & GOVERNMENT DOCUMENTS.
Passes all 36 International Forensic Tests, Words once written on this paper cannot be erased by any means.
Toxicity : 400 times safer than DDT
Now possible to get crops, vegetables and milk without any harmful residual toxicants.
Simple manufacturing process, with no pollution or residual sludge.
The ideal every ecologist is striving to achieve

Winners of National Award for IMPORT SUBSTITUTION FOR PIGMENTS

All our pigments are indigenously developed.
They have saved Foreign Exchange worth several lakhs of rupees in the past 16 years.

We now enter into our 18th year of dedicated research activity to serve the nation, under the able guidance of our Director. Shri M. N. Sukhatme

Pioneer manufacturers of Special pigments for all types of Plastics & Synthetic Pearl Pigments.

Special Reports

Ambitious oil production target

From O. N. KOUL

SRINAGAR

IT seems India has no option but to accept the foreign companies' demand for a share in the oil struck in any of the blocks offered to them. "No company will come without a share in the produce", observed Mr P. C. Sethi, the Union Minister for Petroleum and Chemicals, while talking to newsmen here at the end of a two-day meeting of the consultative committee attached to his ministry. He, however, repeated his earlier observation that no oil would be allowed to go out of the country even if the oil sharing condition were to be accepted.

As is well known, India recently offered 32 blocks to foreign companies for oil prospecting. These comprised 17 offshore and 15 onshore blocks. But, the Centre did not receive bids for all the blocks, delaying finalisation of agreements which, according to Mr Sethi, would be for a period of four years each and were now "in the process of being finalised".

However, if the plans for oil production as unfolded by Mr Sethi succeed, India need not get unduly worried about the participation of foreign companies in its oil prospecting programme. By the end of 1983, the Minister maintained, India's own production of oil was expected to be of the order of 30 million tonnes which would be short of the estimated requirement in that year by only five to six million tonnes. This will be a remarkable advance considering that the imports during the current year are expected to be of the order of 16 million tonnes to meet the estimated requirement of 33 million tonnes after accounting for indigenous production of 16.9 million tonnes. "I am glad to say that we have succeeded in making arrangements for import of these quantities", Mr Sethi said, placing the foreign exchange outgo on oil imports during the current year at about Rs. 5,500 crores against over Rs 6,000 crores last year.

The king-pin in India's effort to at least achieve a near self-sufficiency in oil in the next about three years remains Bombay High where, according to Mr Sethi, the current production level was nine million tonnes against only five million tonnes recently. In 1983, the production level at the Bombay High was expected to be of the order of about 20 million tonnes and thus account for about 66 per cent of the total estimated oil production in the country in that year.

Fortunately, Mr Sethi did not share the enthusiasm found by this correspondent in certain responsible quarters in New Delhi recently about bringing the yield rate of oil wells in India at par with the Soviet Union. "The problem is that of the depletion of wells", he said, placing its "normal rate" at five to six per cent. He, however, added, that India was trying to improve the working conditions on wells, as in Gujarat, with assistance from the Soviet Union and was also reducing the depletion rate of its oil wells by hitting additional sources of supply.

Meanwhile, the Centre has formulated plans for raising the country's oil refining capacity from 31.8 million tonnes at present by another 15 million tonnes by the end of the Sixth Plan period. A six million tonne refinery at Mathura "is in advanced stage of construction and is likely to be commissioned towards the end of the current year". Two other refineries are proposed to be set up in the Sixth Plan period with a total installed capacity of nine million tonnes. With these, the number of oil refineries in the country will go up to 14. Of the 11 refineries at present, only the Digboi re-

Foreign currency deposits by non-residents

NEARLY Rs 225 crores worth of foreign currency was deposited at the end of 1979 by the non-residents in the Foreign Currency Non-resident (FCNR) Deposit Account introduced by the Government of India in November 1975. Of this the dollar accounts numbering 51,726 accounted for Rs 193 crores, while the pound sterling accounts numbering 12,896 accounted for about Rs 32 crores. The bulk of the accounts had small deposits — eighty per cent of dollar depositors had amounts below Rs 45,000 ($ 5,000) each while ninety per cent of pound sterling depositors had below Rs 51,000 (£ 3,000) each.

According to a study prepared by the Data Processing Division of the Department of Statistics and published in the February 1981 issue of the *Reserve Bank of India Bulletin*, the inflow of deposits for the two currencies together showed a declining trend from the second half of 1978. The share of fresh remittances in the total deposit amount has also been falling since then. The following table highlights the position of FCNR deposits in pound sterling and US dollar.

	Pound Sterling (Million £)	US Dollar (Million $)
No. of accounts opened	12·986	51,726
Amount	19.83	224.85
Amount in Rs. crores*	31.67	193.31
Proportion (%) deposited through :		
Fresh remittances	84.1	78.7
Transfer from non-resident (external) rupee accounts ..	1.9	2.4
Renewal of FCNR accounts	14.0	18.9

* Rupee equivalents arrived at by using the average of daily conversion rates for each month.

finery of the Assam Oil Company is in the private sector.

Plans have been either undertaken or formulated also for providing additional facilities in the existing refineries to maximise production of middle distillates and other products in short supply". The refineries covered or in the process of being covered are in Gujarat, Barauni, Madras, Cochin, Vizag and Bombay. Pipelines to carry crude oil for the Mathura refinery were also expected to be commissioned by the end of the current year. The product pipeline from Mathura to Delhi was expected to be ready by December this year. The Ambala-Jullundur section was expected to be completed by April next.

EXIM BANK

Catalyst for consortia?

From OUR NEW DELHI BUREAU

NEW DELHI

ARRANGEMENTS to set up the EXIM bank are progressing smoothly and it should start functioning around January 1982. The requisite bill, introduced towards the fag-end of the budget session, is expected to be passed in August. The bank will have an authorised capital of Rs 200 crores and a paid-up capital of Rs 50 crores, which will be provided by the Government, partly as a soft loan. The charter of the bank, of cource, empowers it to also raise funds in the international money market.

Finance Ministry officials concede that in the present circumstances this facility is only of academic value. Interest rates in foreign money markets are high and the bank will be under an obligation to extend concessionary loan assistance to exporters. Patterned after similar banks in Japan, South Korea and the USA, the EXIM bank will extend only medium-term and long-term financial assistance, which means that it will be concerned mainly with promotion of exports of projects, capital goods and other items involving large funds and long gestation periods. Once the EXIM bank commences operations the international finance department of IDBI will cease to function. Of late this department has been experimenting usefully with the idea of single-window clearance by having constituted a working group comprising representatives of the various agencies concerned with clearance. The EXIM bank is now conceived as a giant single window for clearance. At one stage is was opined that the Export Credit and Guarantee Corporation should be merged with the bank. But a contrary view was that ECGC should remain outside and serve as a counter-check. This view has apparently prevailed. As for short-term credit for small-scale exports, it will continue to be disbursed by commercial banks.

When the EXIM bank gets into its stride, one of its major functions will have to be to induce Indian construction companies to adopt the consortium approach while bidding for contracts in West Asia. Indian companies are not strong enough in terms of financial and managerial resources to be able to individually compete with the construction giants of the West and Japan. The recent meeting of the Overseas Construction Council duly underlined the importance of the consortium approach and on various earlier occasions also the idea has received similar formal endorsement. But the consortium approach has continued to elude Indian companies, mainly because of their individualistic ethos. Therefore jumbo contracts have been beyond the reach of Indian competitors.

In many cases the Indian companies have found themselves in the role of sub-contractors to bigger parties from industrialised countries. It is only in Iraq and Libya that the Indian builder has made some mark, and that too because of the apathetic attitude of the western multinationals. The EXIM bank can act as a catalytic agent for inculcation of the consortium habit. It could do this by extending extra financial incentives to companies who show a willingness to pool their resources and come forward as a consortium.

Another constraint is the shortage of cement, steel and other construction materials in the country. To the extent these have to be purchased externally by the companies concerned, the net foreign exchange earnings becomes limited. The task force appointed by the Ministry of Commerce to review India's performance in the field of project exports is perhaps seized of all these problems.

UTI investments in real estate?

BOMBAY

THE Unit Trust of India (UTI) wants to enlarge its areas of investment, one of which could be real estate investment, in a big way. According to Mr G. S. Patel, chairman of the UTI, an amendment of the UTI Act would be necessary and the Government would be approached for the same in the near future. The UTI Board was at present processing the proposals. He has explained that the areas of investment needed to be enlarged in view of the low yields from shares in the stock exchanges which fluctuated too often. The UTI which catered to small and middle class investors could not afford this.

The UTI recently declared a record dividend of 11.50 per cent on a capital of about Rs 390 crores for the year ended June 30, 1981. The dividend on the units on the unit-linked insurance plan (1971) was also raised to 8.75 per cent. Mr Patel also announced on the occasion that the trust proposed to introduce a special scheme for religious and charitable trusts guaranteeing a minimum dividend of 12 per cent. The scheme envisaged a minimum investment of Rs 50,000 by the participating trusts for a minimum period of three years. The participating trusts would not be allowed to withdraw any fund during the first year but withdrawal would be permitted to the extent of 20 per cent in the second year and further to about 50 per cent during the third year. He had also stated that the UTI was planning to introduce a special scheme for non-resident Indians which was being finalised in consultation with the Reserve Bank of India and the Government. The scheme would guarantee minimum return to the investors.

The trust's total income increased to Rs 59.10 crores in 1980-81 from Rs 47.17 crores in 1979-80. It was this factor which had enabled the UTI to declare a record dividend of 11.5 per cent for the year ended June 30, 1981, compared to 10 per cent paid for the previous year. A sum of Rs 5.85 crores was transferred to the reserves increasing them to about Rs 60 crores at the end of 1980-81. Additionally a sum of Rs 3.16 crores was provided at depreciation of investments.

According to the UTI, the trust's total investible funds increased to Rs 523 crores at the end of 1980-81 from Rs 467 crores at the end of the previous year. Of these Rs 412 crores represented investments in the corporate sector. Its investments in equities totalled Rs 130 crores while in preference shares they amounted Rs 15.47 crores. Investments in debentures had increased to Rs 138 crores from Rs 112 crores and company deposits to Rs 66 crores from Rs 39 crores.

Mr Patel was confident that UTI's sales would increase to over Rs 45 crores during the current year. Its sales of units under the 1964 scheme amounted to Rs 40 crores during 1980-81 against Rs 49 crores in the previous year. It had set a target of only Rs 35 crores for the year.

According to Mr Patel, the withdrawal of units as eligible assets for clearing capital gains tax, the entry of public sector undertakings in the market, the upward adjustment in the interest rate structure of commercial banks and other savings media had contributed during the year to intensification of competitive pressure on units.

Need for sugar buffer stock

BOMBAY

THE Maharashtra Rajya Sahakari Sakhar Karkhana Sangh (Maharashtra State Co-operative Sugar Factories Association) has called on the Government to build immediately a buffer stock of 15 lakh tonnes of sugar in order to avoid sharp movement in prices that follow from fluctuations in production of as much as 40 per cent in a four-year cycle. It said that the cost of the buffer stock will be about Rs 30 crores a year and this could be easily met by setting apart five paise per kilo of production.

Its president, Mr Madhavrao Boraste, however, opposed the import of sugar whether for buffer stock purposes or otherwise. He said that India's import of sugar could be compared to Saudi Arabia's import of oil. The country accounted for 16 per cent of the world sugar production, the highest share for any country. It was wrong on the part of the Government, he said, to import sugar and add to Rs 4,500 crores balance of trade gap.

On the contrary, Mr Boraste suggested that the Government should lift the ban on exports from November 15 in order that this country might be able to fulfil its export quotas. He pointed out that the production capacity of sugar industry would rise from 55 lakh tonnes in 1977-78 to 68 lakh tonnes next year. Also sugarcane crop would be a record one as in 1977-78. The experience of the industry during 1977-78 of depressed sugar prices would not be, however, repeated though the prices may be somewhat lower than at present. The domestic consumption of sugar had increased and exports could help in ensuring that stocks were not built to undue proportions.

The Sangh is now in its silver jubilee year, and Mr Boraste took the opportunity of the occasion to speak of the progress of sugar co-operatives in Maharashtra. In the just concluded season, he said, there were 78 factories in operation in the State, of which 68 were sugar co-operatives. These factories accounted for 40 per cent of the country's total sugar production with the share of co-operatives as high as 36 per cent and that of private factories four per cent. He pointed out that sugar was produced in the country in 18 different states but only in Maharashtra, Uttar Pardesh, Tamil Nadu, Andhra Pradesh and Karnataka there was a surplus production. Of that surplus production again Maharashtra's share was as much as 75 per cent, which meant that Maharashtra was supplying sugar to the entire country.

He dismissed the criticism generally made against co-operatives as ill-informed. There was a misleading impression also that the area under cereals, coarse grains and oilseeds had gone down in the State because of expansion of acreage under sugarcane. This was not the case. While in the whole country only 2.3 per cent of the acreage was under sugarcane, the proportion was just 1.5 per cent in Maharashtra. Uttar Pradesh had as much as 9.4 per cent of the area under sugarcane, Haryana 5.4 per cent, Punjab 2.8 per cent, Tamil Nadu 2.7 per cent, Bihar, Andhra Pradesh and Kerala 1.6 per cent each. The figures of the cultivated areas in the State under different crops would make this further clear — jowar 68 lakh

Mr Madhavrao Boraste, chairman of the Maharashtra State Co-operative Sugar Factories Association, died in Bombay on July 22. Mr Boraste, who was 53, had suffered a severe heart attack on the eve of the annual meeting of the association in Bombay on July 15 and had to be admitted to a hospital. Mr Boraste, who is survived by his wife, two sons and a daughter, had also taken active part in the recent farmers' agitation in the State.

He welcomed the State Government's determination to make Maharashtra self-sufficient in foodgrains in four years but expressed the view that unless more area was brought under irrigation this would not be possible. The Barve Committee had recommended that all the irrigation projects in the State should be completed within a period of twenty years by 1981 but the situation was such that no one knew whether they would be completed twenty years hence.

No change in lending rates

BOMBAY

COMMERCIAL banks' lending and deposit rates are not being disturbed despite that the fact that the Bank rate has gone up to 10 per cent from nine per cent from July 11 and the statutory liquidity ratio (SLR) and cash reserve ratio have been increased as a part of anti-inflationary package. This was officially announced after a meeting of the Governor of the Reserve Bank of India (RBI), Dr I. G. Patel, with chief executives of major banks.

Certain adjustments in the interest rates on the re-finance facilities were, however, proposed by the Governor consequent to the change in the Bank rate. First, with effect from July 18 the interest rates on food and export refinance will rise from nine per cent to 10 per cent but the commercial banks' lending rates for food procurement and export

As I see it

The mirage of exports

THE much-publicised Indian construction contracts in Iraq, which were advertised to be capable of yielding profits of Rs 200 crores, would now be involving this country in a net foreign exchange loss of Rs 340 crores. As is customary in such cases, there is no dearth of explanations for this sorry state of affairs. It is stated that these contracts were entered upon fixed rates without any provision for any escalation of costs. The phenomenon of rising prices has been in this country for quite some time now. It is surprising, therefore, that Indian parties did not look into the possibility of price rise in dealing with the future propositions.

It was also strange that while the Arab countries were clamouring for years on for compensating the Arab oil exporters for the loss of value in dollar on account of price rise in the western countries, the persons in India dealing with the same Arab countries did not bother to safeguard their economic interests while concluding commercial deals with these countries. The fact is that Arab governments are not as soft as the Government of India toward the delinquent foreign contractors — a factor which the Indian parties apparently failed to take into account. There is an aura of unrealism in India's export efforts, where exporting in itself has come to be looked upon as the most desirable activity, irrespective of any consideration of whether the export activity brings a profit or a loss to the country.

Among the factors that have vitiated the price structure of the contracts, the inability of the Indian construction companies to complete jobs as per the original time schedule has been the principal one. In the fixed-time-schedule contracts, heavy penalties are imposed on the non-fulfilment of the project according to time. The danger is that the loss to the country would not be confined to monetary terms but would also involve a loss of goodwill and provide a major point in the propaganda campaign against Indian expertise and capabilities in foreign countries.

The sorry plight of the Indian construction contractors in Iraq should come as a warning against any undue optimism on the outcome of an Indian company having bagged contract for construction in a foreign country. Unfortunately there is hardly any machinery at the level of the Government of India to ensure that whenever any Indian contractor quotes rates for foreign tender the essential profitability of the venture is protected against all exigencies. The export front seems to have been provided for various operators to come forward and claim incentives of one kind or the other, irrespective of whether such an incentive is indeed called for and whether the country was deriving any benefit out of this expenditure from the public exchequer.

The report of the Task Force, which Mr Pranab Kumar Mukherjee, Union Minister of Commerce, announced in the Lok Sabha on May 8, would no doubt examine the profitability aspect of project exports. A campaign is being built up in the country against the provision for the use of at least some India-made equipment and machinery in project exports. In the absence of such a stipulation the so-called project exports turn out to be nothing but a modern version of the supply of indentured labour from India for the development of some economic projects in foreign countries with money as happened in the last century—with this difference that now more educated persons compose the labour force. But the condition of employment is not very much better than that of the indentured labour: The passports of Indians are impounded on arrival and the security of their person is minimal as the manner of death of an Indian engineer recently in Baghdad so graphically brought out!

Subhash Chandra Sarker

credit would, however, remain unchanged.

Secondly, in regard to two re-finance facilities linked to the Bank rate the RBI has decided that effective from the close of business of July 11 (i) the re-finances rate in respect of shipping loans would stand raised from 10.5 to 11 per cent and the lending rates of banks from 11 to 12 per cent and, (ii) the re-finance rates for loans covering imports of capital goods would similarly stand raised from nine to 10 per cent and the lending rates of banks from 11 to 12 per cent. The re-finance scheme for imports of capital goods has already been terminated from July 1, 1981, and the outstanding re-finance has to be repaid by October 1, 1981.

In view of the higher re-finance rates and other measures such as increase in the statutory liquidity ratio the banks will be free to raise those of their lending rates which are below the maximum rates prescribed under the present structure by the RBI. This has been done with the idea of reducing the adverse effect on the profitability of banks.

At the meeting the Governor expressed serious concern over the continued high pace of monetary and credit expansion and the growth of primary liquidity in the economy. He urged the chairmen of the banks to ensure that credit expansion of their banks was kept strictly within the guidelines set out in May 1981 and underlined that banks should not default in maintaining the enhanced cash reserve ratio and statutory liquidity ratio. The need for credit discipline, the Governor emphasised, was all the greater as the banks would have to meet the credit requirements arising from the various steps taken by the Government to enlarge supplies of essential commodities for public distribution.

BUSINESS OPINION

MR C. G. Devaya, chairman, Madras Aluminium Co Ltd : "The aluminium retention prices are being fixed with no provision for automatic escalation for the projected cost increases, under which the operations are to be carried out. As a matter of fact, real costs would have to be computed duly providing for increased depreciation to enable replacement of capital assets at future costs. This aspect has been neglected in the past and is certainly catching up with us, now that our machinery and plant need both replacement and modernisation. Unless there is a committed and sophisticated system for sensoring, monitoring and flexing policies, the better thing would be to decontrol and let responsible business ensure ethical trading, rather than risking the industry being strangulated. The Government perhaps could as well try out deregulation. The lack of adequate retention prices has adversely affected all the primary producers during 1980. We seem to be at a tug-of-war with the Central Government for higher retention prices, all the time, but always at the losing end. With a continuous uncertainty about future pricing and returns, how could we have the confidence to invest in the long term basic needs ?

"The markets have been sluggish from the end of 1980 and have now reached a point where there is sparse demand for both controlled and non-controlled metal. The electricity boards are not placing orders on the conductor manufacturers who have large stocks of metal and their bills for large sums have not been cleared. The high rate of excise duty still retained by the Central Government at 44 per cent acts as a retarder and there is resistance from the end-users.

"The large scale imports by MMTC on the basis of certain projected demand are now found to be far in excess in relation to the reduced demands. The markets are glutted. The MMTC, the producers, the conductor manufacturers and several end-users find themselves with large inventories. We have requested the Government to stop imports and take over our stocks at retention prices or imported prices whichever may be higher duly making up the difference through a rebate of excise duty. A national buffer reserve of imported metal could be established to regulate future availability and prices duly ensuring that domestic production does not suffer. There may be better solutions, but let there be a solution."

MR C. K. Patel, chairman, Adarsh Chemicals and Fertilisers Ltd, discussing the factors leading to the reduced profitability of the company for the year 1980, stressed that the single superphosphate (SSP) got outpriced as compared to other phosphatic fertilisers following price rise declared by the Government. He regretted that the Gujarat Government did not declare special state subsidy on the sale of SSP as was already done by Maharashtra and other states and hoped that even if now also such a subsidy was declared, the farmers of Gujarat would benefit.

The chairman also pointed out the present pricing formula is disadvantageous to the SSP industry in the country as it does not compensate for increase in cost of production on various accounts. The present formula compensates the industry only for increase in cost of raw materials and packing materials.

Shortages and surpluses

Fertiliser

Fertiliser glut in West Bengal. Attributed to inaccurate fertiliser demand estimate and actual allocation made on that basis. Different agencies in West Bengal currently holding a stock of about 10,000 tonnes of nitrogenous fertiliser, 5,000 tonnes of phosphatic fertiliser and 1,500 tonnes of potash.

Wagons

The movement of fertilisers from Visakhapatnam port hit by the stoppage of wagon supply by Railway Board.

Cement

Construction activities in Nagpur suspended for want of cement.

Fast growing garment exports

Concluded from page 164

total reliance on cotton. This proposition also received support from the group on garment exports appointed by the Government of India in 1977. But introduction of man-made fabrics in garment exports will be difficult unless the heavy duties on man-made yarn are removed or lowered. The working group also saw scope for increase in export of silk garments, which at present are minimal. This would require improvement in the quality of silk and more competitive prices.

The employment potential of the Indian garment export industry can be seen from the fact that an investment of only Rs 1,500 to buy two sewing machines provides employment to three persons. A survey conducted by the Garment Exporters Association shows that a random sample of 25 exporters—big, medium and small—had an investment of Rs 2.6 crores, an annual turnover of Rs 24.4 crores and provided employment to 3000 persons.

The next Indian Garment Fair, organised annually by the GEA, will be held in Delhi from September 18 to 20. Delhi is normally the venue as 65 per cent of the garment exporters are located in and around the national capital.

MONSOON, CROP AND COMMODITY SURVEY: JUNE 1981

Month-end rains brighten kharif prospects

By Commerce Research Bureau

AFTER the initial early onset, the advance of the southwest monsoon got delayed for some time and for a good part of the month of June large areas in the country were smarting under scorching sun and drought. The picture however turned for the better in the second fortnight of the month with the Bay of Bengal branch of the monsoon advancing into the eastern parts of the country and by the end of the month nearly 69 per cent of the net sown area received good rainfall. Only a week earlier less than 50 per cent of the net sown area had received good rainfall. The timely rains raised hopes of a good kharif crop for which a target of 83 million tonnes has been set. However, the rainfall was deficient in some parts of the country like the states of Assam, Meghalaya, Nagaland and Tripura, sub-Himalayan West Bengal and Sikkim, Bihar plains, hills of west Uttar Pradesh, Rajasthan, the regions of Saurashtra, Kutch and Marathwada and south interior Karnataka and was scanty in Punjab.

Before the onset of the monsoon the drought conditions had become severe in the states of Andhra Pradesh, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Rajasthan and Tamil Nadu. During the financial year 1981-82, the Union Government has already sanctioned over Rs 109 crores as drought relief to three states—Rs 26.25 crores to Andhra Pradesh, Rs 33.92 crores to Rajasthan and Rs 48.90 crores to Tamil Nadu. The Central assistance was under consideration for Haryana and Karnataka. However, no request for Central assistance was received from the remaining two states of Madhya Pradesh and Maharashtra up to June 23, 1981.

With the wheat procurement falling short of the target of 9.5 million tonnes by over three million tonnes, the foodgrains stocks (excluding coarse grains) with the Government at the end of June 1981 were 13.3 million tonnes as against the stocks of 15.9 million tonnes at the end of June 1980. The composition of the stocks was 7.5 million tonnes of wheat and 5.8 million tonnes of rice against the corresponding figures of 8.8 million tonnes and 7.1 million tonnes respectively for June, 1980.

The Agricultural Prices Commission recommended the price policy for kharif crops for the 1981-82 season. The Union Government sought the views of the state governments on the prices recommended for the cereal crops. The cropwise procurement prices recommended are given below:

(Rs per quintal)

Crop	Procurement price	
	1980-81(a)	1981-82
Paddy (common variety)	105	113
Jowar	105	115
Bajra	105	115
Maize	105	115
Ragi	105	115
Cotton (320F) (FAQ)	304	375

Note: (a) Prices fixed by the Centre

Commerce Research Bureau — Map not drawn according to scale

The Union Government decided to set up a National Water Development Agency to exploit fully the irrigation potential of various rivers in the country. To begin with, it would undertake a study of the peninsular rivers.

The monopoly cotton procurement scheme of Maharashtra came to an end on June 30, 1981 as the Centre's sanction to the continuance of the scheme beyond that date was not received. The State Government was however, making efforts to get the Centre's approval to the scheme's continuance.

The proposed import of two lakh tonnes of sugar would help build up a sugar buffer stock, besides immediately bringing down the open market sugar prices, according to the Union Agriculture Minister, Rao Birendra Singh. The entire quantity of imported sugar would be received before the next sugar season. The Minister said sugar production in the next season was expected to be very good and the Government was planning to set up a sugar buffer stock of five lakh tonnes.

The following paragraphs present the Statewise and cropwise position for the month of June 1981.

Progress of the South-west Monsoon during June 81

State/Region	Population 1971 Census (million)	Net area : 1971-72 million hectares			Kharif crops		Rainfall for the period June 1 to June 24, 1981				Rainfall for the week ending June 1981

Figures of rainfall for Assam include also those for Meghalaya

ANDHRA PRADESH

The State Government proposed to set up an edible rice bran oil extraction plant at an estimated cost of rupees one crore as a joint venture at Bhimavaram in West Godavari district.

The Coffee Board urged the State Government to bring an additional 20,000 hectares under coffee cultivation, thus employing nearly 35,000 tribal families throughout the year. The Andhra University was among the six universities chosen to impart training under the manpower development for coffee plantation expansion programme. Nearly 1,500 people, including senior executives and superiors, would be trained under the programme in the latest techniques of coffee cultivation.

ASSAM

As a result of the heavy rains in the last week of the month the Brahmaputra and its tributaries were in high spate.

Drought in the State during the months April-June caused considerable damage to "ahu" paddy and jute crops. The worst affected districts were Kamrup, Goalpara and Darrang. The area affected was 40,000 hectares under 'ahu' paddy and 1.14 lakh hectares under jute.

BIHAR

The Planning Commission approved seven irrigation schemes in the State at a total estimated cost of Rs 39.7 crores under which reservoirs would be constructed at Latratu, Tapkara, Suru, Torlow, Sonua, Nandini and Sindwarni. On completion, these projects would irrigate an additional 42,416 hectares in Rohtas, Ranchi, Singhbhum and Monghyr districts.

The State Government decided to launch the Centrally sponsored minikit project in the State during the coming kharif season to increase the acreage under the high yielding varieties of paddy. It was hoped that the project would help the State Government achieve the current year's food production target which was fixed at 116 lakh tonnes as against the last year's target of 110 lakh tonnes.

Scarcity of sugar was reported from many parts of the State during the month as there was delay in transportation of sugar from Maharashtra.

GUJARAT

The State Government had taken steps to increase the oilseeds production from the present 1.8 million tonnes to 2.5 million tonnes. Out of the targeted 2.5 million tonnes, 2.3 million tonnes would be groundnut and the remaining 200,000 tonnes would be other oilseeds. Seeds and agricultural kits for this purpose had been already supplied to about 2,000 farmers in Vadodara district. About 20,000 farmers would be covered in the State for growing soyabean crop.

The State Government fixed the profit margin for oil millers and crushers, wholesale and retail dealers in groundnut oil. The margins were half a per cent on landing price for millers, one per cent for wholesalers and two per cent for retailers and would take effect from July 1, 1981.

The Cotton Corporation of India (CCI) procured 2.14 lakh bales of cotton this year in the State as against 1.64 lakh bales procured during the previous year—a rise of over 30 per cent.

HARYANA

The Chief Minister, Mr Bhajan Lal, claimed that the State had achieved the target of 64 lakh tonnes of foodgrains production in the 1980-81 season and that it was now set to achieve the higher target of 70 lakh tonnes for 1981-82 season.

The State Government decided to introduce crop insurance from the forthcoming kharif season for rice in 13 tehsils and for bajra in four tehsils on an experimental basis. Crop insurance for wheat would be introduced from the next rabi season in 39 tehsils in the State.

HIMACHAL PRADESH

The Chief Minister announced cash subsidy of Rs 25 a quintal on all grades and varieties of apples sold to the Himachal Pradesh Horticulture Produce Marketing and Processing Corporation. The Corporation aimed at crushing about 1.50 lakh quintals of apples during 1981-82. The rupees four-crore plant of the Corporation at Parwanoo was expected to go into full production very soon.

A Rs 12-crore cold storage project with a storage capacity of 14,250 tonnes would be set up in the co-operative sector in the State with the World Bank aid.

A high-level study team of the Reserve Bank of India calculated that the total short-term agricultural credit needs of the State would be Rs 51 crores by the end of June 1983.

JAMMU & KASHMIR

A study team appointed by the Reserve Bank of India recommended the reorganisation of primary agricultural credit societies, rehabilitation of State and Central co-operative banks, measures for the recovery of overdues and constitution of a common cadre o secretaries for the primary agricultura credit societies in the State. The stud team estimated the short-term crop loa requirements of the State at Rs 17 crores

KARNATAKA

Nearly 10,000 sheep reportedl perished in the rinderpest epidemi raging in Bellary, Dharwar, Chitradurga and Shimoga districts.

The silk output in the State wa likely to show a 20 per cent drop during the current year, due to the 'uzi fly menace.

KERALA

The State Government was asked by the Centre to reduce the minimum support price of cocoa beans to facilitate exports. The State Government decided to abolish the 4.5 per cent purchase tax on cocoa.

The World Bank-aided Special Agricultural Development Unit (SADU) in the State would take up a scheme to rejuvenate coconut cultivation in about 3,500 hectares during 1981-82.

The monopoly procurement of raw cashew in the State crossed the targeted mark of 60,000 tonnes during the 1980-81 season out of a total production of 88,000 tonnes.

MADHYA PRADESH

Efforts were being made to encourage small farmers and landless labourers to take to tusser sericulture in Balaghat, Mandla, Chhindwara, Raisen and Jhabua districts. During 1980-81 the State produced 6.59 crore cocoons as against 3.37 crore cocoons in 1979-80.

The State Government was faced with an uphill task to achieve its wheat procurement target of two lakh tonnes. The State had so far achieved only about 50 per cent of the target despite a two-month vigorous drive and a ten per cent levy on traders.

MAHARASHTRA

The advance of the southwest monsoon at the end of the month in Konkan, north Deccan and Marathwada regions enabled the farmers to start sowing operations. In all the four districts of the Konkan—Sindhudurg, Ratnagiri, Raigad and Thane—sowing of paddy and ragi seeds has been completed. In the Pune and Vidarbha regions, sowing of kharif crops like jowar, bajra, groundnut, tur, cotton and pulses was undertaken. In the Marathwada region 40 per cent sowing had been completed.

The State Government fixed the foodgrains production target for 1981-82 at 115 lakh tonnes as against the production of 90 lakh tonnes during 1980-81

The State Government's Monopoly Cotton Procurement scheme came to an end from July 1, 1981 with the expiry of the Maharashtra Raw Cotton (Procurement, Processing and Marketing) Act, 1971 on June 30, 1981. However, a draft bill seeking the extension of the scheme for 10 years was forwarded to the Centre by the State Government. Meanwhile the Maharashtra State Co-operative Marketing Federation (MSCMF) announced a reduction of Rs 75 in the per candy prices of Varalaxmi cotton of the 1980-81 season with effect from June 19, 1981.

The Planning Commission approved the Rs 72.66-crore Nandur Madhameshwar irrigation project on the Darna river. The project, when completed, would provide irrigation to 43,860 hectares of land in Ahmednagar and Aurangabad districts.

The Maharashtra State Seeds Corporation would distribute 5,600 tonnes of improved jowar seeds to farmers for the kharif season. The Corporation would also distribute 22,000 quintals of quality cotton seed for sowing this season as against 9,000 quintals last season.

The Maharashtra State Co-operative Bank Ltd decided to grant loans to cotton growers in the dry belt for raising capital for setting up co-operative spinning mills in the State. Under the scheme prepared by the Bank, each cotton grower would get a maximum loan of Rs 3,000 while the marginal cotton grower owning about three hectares of land would be completely exempted from payment of the interest.

ORISSA

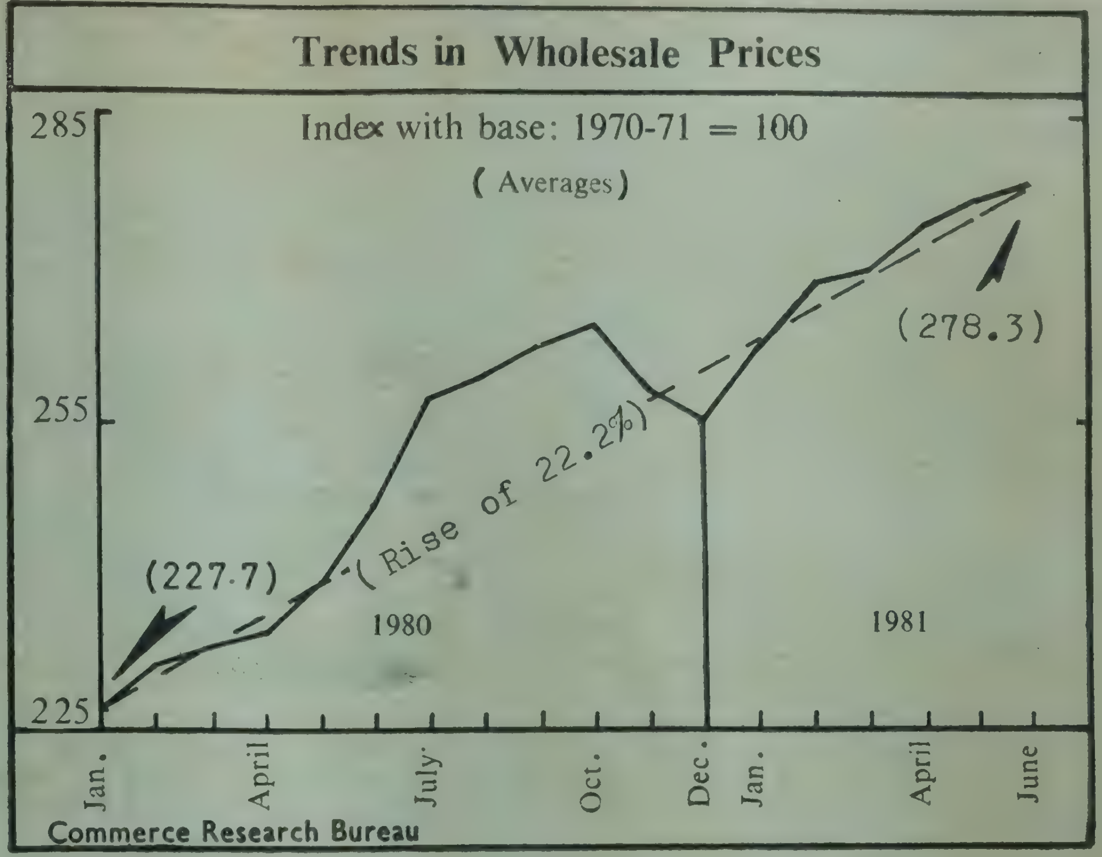
The Agriculture Department of the State fixed an ambitious programme to boost the foodgrains production to 64.64 lakh tonnes during 1981-82 as against 54.82 lakh tonnes during 1980-81. To achieve the target it was decided to increase the area under high yielding varieties of crops.

PUNJAB

According to an official survey Karnal Bunt disease of wheat crop was reported to have spread over eight districts—Gurdaspur, Patiala, Amritsar, Firozpur, Ludhiana, Kapurthala, Hoshiarpur and Jalandhar. The disease was detected to the extent of 13 to 43 per cent in samples collected from these areas. The Union Ministry of Agriculture asked the Indian Agricultural Research Institute, New Delhi, to evolve a strategy to control the disease.

RAJASTHAN

According to the State's Minister of State for Public Health, the schemes formulated for supply of drinking water



Trends in Wholesale Prices

PRICES IN JUNE 1981

Uptrend persists

THE wholesale price index continued to move upwards and reached the level of 278.3 during June 1981, an increase of 0.8 per cent over the preceding month. During the first quarter (April-June 1981) of 1981-82 the wholesale price index was higher by 14.8 per cent over the corresponding period of 1980-81. (Last year during this period prices had increased by 21.1 per cent over the corresponding period of 1979-80).

The table alongside presents the percentage variation in the wholesale price index for all commodities since January 1980, while the table below gives the groupwise indices for June 27, 1981 with variations over the corresponding indices a month ago and a year ago.

Month	Wholesale price Index (Average) (1970-71=100)	Percentage change
1980		
January	227.7	+0.3
February	231.4	+1.6
March	233.2	+0.8
April	235.0	+0.8
May	240.1	+2.2
June	247.2	+3.0
July	257.3	+4.1

in the State and the assistance made available by the Centre for this purpose had been inadequate, because as many as 24,000 of the 33,000 villages in the State were facing shortage of drinking water and a sum of Rs 400 crores was required during the next five years to tackle the problem. The Centre had, however, permitted an expenditure of Rs 198 crores only. He, therefore, requested the Centre to provide more funds for the programme and also take into account the State's cattle population while formulating water supply schemes.

The World Bank agreed to give a credit of Rs 64 crores to help implement a Rs 138-crore water supply and sewerage project in Rajasthan. This project would provide water to about 2,000 villages in 10 districts of the State as also improve and extend water supply and sewerage system in some important cities like Jaipur, Jodhpur and Bikaner.

SIKKIM

An official team headed by Dr K. G. Tejwani, Director of the Central Soil and Water Conservation Research and Training Institute, Dehra Dun which studied the land-use pattern in the State, recommended the setting up of a Cardamom Research Centre to evolve suitable agro-techniques for its cultivation including the control of pests and diseases. Cardamom was recommended as a crop for research because in spite of its being the most important cash crop of the State its per hectare yield was extremely low.

TAMIL NADU

Punjab would supply rice to the State following a contract made with Tamil Nadu Civil Supplies Corporation. The movement of rice from Andhra Pradesh with which a contract for one lakh tonnes of non-levy rice was made had just started.

Though the State could tide over the difficult food situation till the *Kurvai* paddy came into the market by December end, the Centre was supplying only 25,000 to 30,000 tonnes per month to the State as against a promised supply of 85,000 tonnes a rice a month according to the State's Finance and Food Minister.

The State Government prepared a three-year programme at a cost of Rs 1.10 crores to raise inland fish production in the State. The project consisted of construction of nurseries, rearing ponds, breeder ponds and the like at 10 centres for achieving an additional production of 100 million fingerlings by the end of the project period.

The State Government urged the Centre to import short staple varieties of cotton from Pakistan and supply them to spinning mills in the State for the manufacture of coarser varieties of yarn, mostly needed by the handloom weavers. The State Government also had sent emissaries to Gujarat and Maharashtra to explore the possibility of securing short staple cotton for its spinning mills.

TRIPURA

The State expected to set a new record by exceeding its tea production target of six million kg this year owing to favourable weather conditions and peaceful industrial relations in the industry. The per hectare yield of tea also recorded an increase from 777 kg in 1978 to 800 kg in 1980.

UTTAR PRADESH

The foodgrain production target of the State for the year 1981-82 envisaged an increase of one milion tonnes over the anticipated production of 23.2 million tonnes during 1980-81. Accordingly, the agricultural development programmes to be taken up would be aimed at achieving an annual growth rate of 5.5 per cent in the agricultural sector. The wheat production target had been set at 11.4 million tonnes—0.8 million tonnes higher than that of last year. The target of rice production was 6.2 million tonnes as compared to the anticipated production of 6 million tonnes last year. A marginal decrease of 50,000 tonnes in last year's target of 2.1 million tonnes for coarse grains had been fixed for this year.

The Ramganga irrigation project had so far created an irrigation potential of 5.65 lakh hectares. An additional potential of 6.75 lakh hectares was proposed to be created by the end of 1984-85, the terminal year of the Sixth Plan. In the command area of the Project, 20,000 km-long water courses had been either remodelled or newly constructed.

The State Government decided to set up a fertiliser corporation on the pattern of other manufacturing corporations with a view to producing and selling fertilisers in the State. The new corporation would be entrusted with the responsibility of establishing four gas-based fertiliser plants involving an investment of Rs 2,400 crores with the help of Central assistance and funds from financial institutions.

Several drinking water supply schemes prepared by the Uttar Pradesh Jal Nigam were being implemented on a priority basis to provide potable water in the rural areas.

The Uttar Pradesh Governor promulgated the Uttar Pradesh Land Laws (Amendment) Ordinance, 1981, whi sought to provide relief to the schedul castes and other landless agricultu labourers against eviction from the la allotted to them by the State Gover ment or *gaon sabhas.*

A project had been drawn up f implementation of social forestry in t State during the Sixth Plan on priori basis because of shortage of fodd fuel and raw material for rural cotta industries. The project would be spre over 41 districts of the State.

WEST BENGAL

The cereal production in the Sta had increaesd by 6 per cent during t past four years. The target fixed f cereal production during 1981-82 w 10 million tonnes as against 9.2 milli tonnes last year. The target for Am paddy had been fixed at 64 lakh tonne Aus paddy 8 lakh tonnes, Boro pad 11 lakh tonnes, wheat 14 lakh tonne oilseeds three lakh tonnes and puls one lakh tonne during the current yea

Four of the State's backward di tricts Jalpaiguri, Cooch Behar, Banku and Purulia have been selected f massive fertiliser education programm under the Indo-UK Fertiliser Educatio Project. The project would be unde taken by the Hindustan Fertiliser Co poration for a period of five yea initially.

The slow pace of identification an recording of share-croppers was causin concern to the State's Land Reform Department which decided to exten the "Operation Barga" time limit up t December 31, from June 30, 1981. Th utilisation of officials for municipal elec tions and assembly and parliamentar bye-elections was cited as the reaso for the slow pace.

The State Government extended th scope for institutional finance to bar gadars during 1981. The target for suc loan recipients was fixed at 2.50 lakh as against the total number of recipient of about 1.30 lakhs last year.

The State Government proposed t take legal steps for the extension of th last date of June 12, 1981 for submis sion of returns under section 10(1) o the West Bengal Land Holdings Reve nue Act, 1979. Under the Act nearl five to six lakh *raiyats* were to submi returns to the Government for assess ment of their land holdings in the rura areas.

The Jute Corporation of India fixe the procurement target for the State a 8.75 lakh bales of raw jute for the 1981- 82 jute season. It purchased 4.70 lak bales of raw jute in the State durin the 1980-81 season (July-June).

A severe cyclone accompanied by torrential rain lashed Midnapore district on June 20-21, 1981. Several rivers in the district crossed the danger level as a result. Many low-lying areas were flooded and seedlings destroyed.

Rice

The Agricultural Prices Commission (APC) recommended Rs 113 per quintal as the procurement price for common variety of paddy for the 1981-82 kharif marketing season (November 1981-October 1982). This marked an increase of Rs 8 per quintal over last year's procurement price of Rs 105. The Centre had sought the views of the States on the APC's recommendation.

In the Delhi market the price of rice (basmati) increased by 21.2 per cent over the month to Rs 450-550 per quintal.

Wheat

Wheat procurement in the current rabi marketing season (April 1981-March 1982) until June 27, 1981 totalled 62.5 lakh tonnes as against the target of 95 lakh tonnes. The procurement during 1980-81 was 58 lakh tonnes. Punjab procured the maximum quantum of 37 lakh tonnes followed by Uttar Pradesh with 13 lakh tonnes. Haryana procured 11 lakh tonnes and other States accounted for about two lakh tonnes.

The price of wheat (dara) in the Rohtak market at Rs 130-148 per quintal showed a fall of 2.8 per cent over the month.

Jute

The Centre fixed the statutory minimum price for W-5 grade jute for the 1981-82 jute season (July 1981-June 1982) at Rs 175 per quintal ex-Assam, as recommended by the Agricultural Prices Commission, an increase of Rs 15 per quintal over the last year's floor price of Rs 160 per quintal.

The Industrial Reconstruction Corporation of India sanctioned Rs 4.88 crores to four jute mills under the National Jute Manufacturers Corporation to enable them to implement their crash programme for modernisation and renovation of plant and machinery.

The Union Government decided in principle to allow the Jute Corporation of India (JCI) to continue raw jute export for the 1981-82 season. The JCI concluded raw jute export contracts totalling nearly 2.5 lakh bales valued at about Rs 12 crores against shipment schedule extended up to May-June 1981. Over 50 per cent of the total contracted quantity had already been shipped.

The JCI fixed a procurement target of 21 lakh bales of raw jute for 1981-82 season, as against 10.60 lakh bales procured by the JCI and co-operatives in 1980-81. Unsold stock with the JCI was reduced to 10.30 lakh bales from 27.45 lakh bales by disposing of 15.67 lakh bales to private and nationalised mills and exports of 1.46 lakh bales.

In West Bengal, the Corporation would purchase 8.75 lakh bales and the State Co-operative Marketing Federation 4.5 lakh bales for the 1981-82 season. Procurement in north Bengal would commence on July 15 and in south Bengal on August 15. About 60 panchayats would function as purchasing agents for the JCI. The JCI and the Federation would buy raw jute from two lakh identity card holders in the eight border districts of the State.

In the Calcutta market the price of Jute (W-5) ruled steady over the month at Rs 217.50 per quintal.

Cotton

The Cotton Corporation of India (CCI) so far purchased about 11.30 lakh bales of cotton during the 1980-81 season (September 1980 to August 1981). Its sales amounted to 10.90 lakh bales (including the sales of 1979-80 season cotton). The Corporation sold 4.47 lakh bales of 1980-81 season cotton to the National Textile Corporation (NTC) mills. It also offered 67,000 bales of cotton (grown in Karnataka) to the mills in the south to tide over the difficult supply position.

The Agricultural Prices Commission recommended an increase of Rs 71 in the support price of cotton (320 F) FAQ to Rs 375 per quintal for the 1981-82 cotton season (September 1981-August 1982).

The price of cotton (CJ-73) in the Bombay market showed a rise of 3.1 per cent over the month to Rs 1,378 per quintal.

Oilseeds

Special emphasis was proposed to be laid on increasing production of oilseeds during 1981-82 in view of the rising import bill for edible oils. The state governments were asked by the Centre to take immediate steps in this respect. The production target for oilseeds for 1981-82 was fixed at 11.2 million tonnes, an increase of a million tonnes over the production of 10.2 million tonnes during 1980-81. The target for groundnut was fixed at 6.7 million tonnes and for rapeseed and mustard at two million tonnes.

The Union Civil Supplies Ministry raised the imported edible oils quota for States during the month by ten per cent. The quantity allocated for the public distribution system was 41,000 tonnes.

Over the month the price of groundnut (kernels) in the Kanpur market showed an increase of 10.5 per cent over the month to Rs 750-830 per quintal.

Sugar

Sugar production during May 1981, the eighth month of the 1980-81 season (October 1980-September 1981), was 77,000 tonnes as against 44,000 tonnes during the corresponding month last year. Total production in the first eight months was 50.41 lakh tonnes as against 37.97 lakh tonnes during the corresponding period last year. Despatches during May were 4.66 lakh tonnes for internal consumption and nil for exports as against 6.11 lakh tonnes for internal consumption and nil for exports during the same month last season.

Total offtake in the first eight months was 30.48 lakh tonnes for internal consumption and 0.60 lakh tonnes for exports as against 36.45 lakh tonnes for internal consumption and 2.30 lakh tonnes for exports during the corresponding period last year. The closing stock of sugar with the factories as at the end of May 1981 was 25.28 lakh tonnes as against 20.07 lakh tonnes at the same time last year.

The Centre retained the tariff value of Rs 640 per quintal for free sale sugar during July 1981.

India purchased about two lakh tonnes of sugar in the international market and efforts were being made to see that the whole quantity reached Indian ports as early as possible. The imported sugar would be available for distribution before the start of the festive season—September to November. The Centre ordered the release of 4.51 lakh tonnes of sugar for internal consumption during July consisting of 2.71 lakh tonnes of levy quota and 1.80 lakh tonnes of free sale quota, the same as for the last month.

In the Bombay market the price of sugar (C-30) declined by 6.9 per cent over the month to Rs 668-670 per quintal.

Rubber

The Union Ministry of Commerce decided to continue till July 15, 1981 the present minimum statutory price of Rs 825 per quintal for RMA-I grade of natural rubber with differentials for other varieties.

The shortfall in natural rubber during 1981-82 was expected to be about 37,300 tonnes excluding the balance 10,000 tonnes of 1980-81. The State

Trading Corporation (STC) contracted for the import of full quota of 37,000 tonnes of natural rubber; of this 23,000 tonnes had arrived. The STC proposed to distribute 9,000 tonnes of imported rubber from July 1, 1981.

The Centre formulated a policy for distribution of imported natural rubber to the small-scale sector. The policy stipulated that 100 tonnes of rubber would be distributed to units whose annual consumption as per the Rubber Board licence was below 12 tonnes.

Tea

Unfavourable weather conditions resulted in a decline in tea production during the current season. The estimated total output at the close of May 1981 was 122.23 million kg, 12.85 million kg lower than the production in the same period last year. The production of north Indian tea during the first five months of 1981 was 70.58 million kg, 10.2 million kg lower than the output during the corresponding period last year. The output in south India was lower by 2.65 million kg than the production in 1980.

The committee on small tea growers set up by the Union Commerce Ministry identified the major problems faced by tea growers in Tamil Nadu and Kerala as stemming from low productivity and the unremunerative prices for green leaf tea.

During 1980-81 India exported 7.21 lakh kg of tea bags valued at Rs 3.1 crores as against 4.93 lakh kg of tea bags valued at Rs 2 crores exported in the previous year.

The price of tea in the Bombay market ruled steady at Rs 2,300 per quintal during the month.

Coffee

The Union Government exempted coffee from the whole of the export duty of Rs 1,500 per tonne with effect from June 19, 1981 in view of the decline in the international price of coffee.

The export target for coffee was fixed at 80,000 tonnes in 1981-82 against 85,000 tonnes exported in 1980-81.

The International Coffee Organisation, governing the world coffee trade, imposed a 10 per cent cut in the producers' export quota to arrest the decline in the price of the commodity.

LAKSHMI MACHINE WORKS LIMITED

NOTICE

It is hereby notified for the information of the public that Lakshmi Machine Works Limited proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a Notice under sub-section (I) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969 for substantial expansion of its activities. Brief particulars are as under :

(i) Name(s) of Person(s)/Body Corporate owning the undertaking. LAKSHMI MACHINE WORKS LIMITED

(ii) Capital structure of the applicant undertaking:

		Rupees
AUTHORISED :		
6,00,000	Equity shares of Rs. 100/- each	6,00,00,000
ISSUED:		
4,12,394	Equity Shares of Rs. 100/- each	4,12,39,400
SUBSCRIBED AND PAID-UP :		
2,30,989	Equity Shares of Rs. 100/- each	2,30,98,900
23,001	Equity shares of Rs. 100/- each allotted as fully paid-up otherwise than for cash consideration	23,00,100
1,52,394	Equity Shares of Rs. 100/- each allotted as fully paid-up without payment being received in cash as bonus shares by way of capitalisation of Reserves.	1,52,39,400
		4,06,38,400

(iii) Details of the proposed substantial expansion :

(a) Names of new goods to be produced, supplied, controlled or distributed, or of new services to be rendered. The Company proposes to manufacture Open-End Spinning Machines in collaboration with M/s. Rieter Machine Works Limited, Switzerland.

(b) In the case of substantial expansion of existing activities :
  - (i) Name of goods)
  - (ii) Capacity before expansion)
  - (iii) Expansion proposed)
  - (iv) Location of the project for substantial expansion) Not applicable
  - (v) Brief outline of the cost of the project, the scheme and source of finance.)

2. Any person intersted in the matter may make a representation to the Secretary Department of Company Affairs Government of India, Shastri Bhavan, New Delhi, within 14 days from the day of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

Dated : 6th July, 1981.

Registered Office :
SRKV Post,
Perianaickenpalayam,
Coimbatore-641 020

(sd) D. JAYAVARTHANAVELU,
Managing Director.
(Name and designation of the Principal Officer of the Undertaking issuing the Notice).

Rustom Mills and Industries Limited makes the finest textiles and technical rubber products.

It also makes the most impressive financial picture.

A 1537% return on shareholders' investment over the last 10 years. Four bonus issues of 1:1, 1:2, 1:1 and 1:1 during the same period.

Rustom Mills and Industries Limited today manufactures the finest cotton and blended fabrics, and Kissan brand dehusking rollers, processing rollers and other technical moulded rubber products.

FUTURE PLANS:

After displaying a tremendous growth and diversification over the last 10 years, under the dynamic leadership of Prafull Anubhai, Rustom Mills and Industries Limited is now set to grow still further.

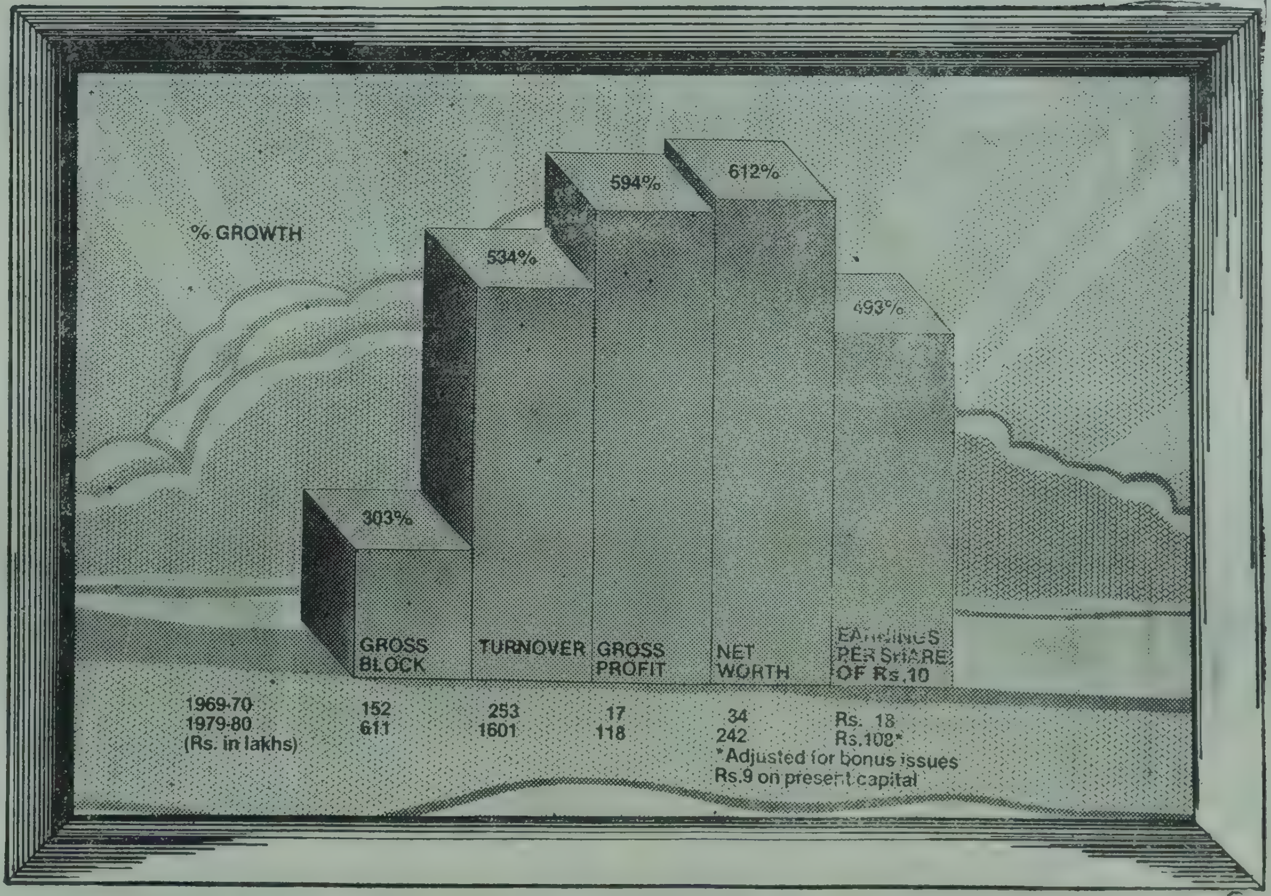
It has plans for the installation of high speed automatic looms, expansion of spindle capacity in its Textile Division, and for the manufacture of textile cots, aprons, and rubber blankets in the Rubber Division.

THE CONVERTIBLE DEBENTURE ISSUE:

The Company will soon offer 2,00,000 Convertible Debentures of Rs. 100/- each, at par. The Debenture holders will be entitled to convert Rs. 30/- out of each Debenture into 2 fully paid Equity Shares of Rs. 10/- each at a premium of Rs. 5/- per Share, after just one year from the date of allotment. If any bonus issue is made prior to conversion, the entitlement of Debenture holders will be increased proportionately. The Debentures are fully secured and carry an interest rate of 13.5% (payable half-yearly). Further 1% per annum additional interest will be paid to Debenture holders provided the Equity dividend exceeds 16% in the preceding year. Such rate of dividend will be appropriately adjusted in case of any bonus issue, during the currency of the Debentures.

You will find Rustom's Debenture Issue a very profitable investment, giving an annual return of 31%.

Your Investment in one Debenture	Rs. 100/-
Less Value of two Equity Shares even at the market price of Rs. 35/-per Share (price as on 2/7/81 Rs. 37/-)	Rs. 70/-
Your Net Investment after conversion	Rs. 30/-
However you get Interest @ 13.5% on balance Amount of Rs. 70/- (Initial Investment Rs. 100/- less Amount converted Rs. 30/-)	Rs. 9.45
Your Annual Return after conversion $\frac{9.45 \times 100}{30}$	31%



Rustom Mills And Industries Ltd

Brij House, Opp. Gujarat High Court, Stadium Road, Ahmedabad 380 014

The issue opens on 10th August,1981.

Rustom Convertible Debentures for Security and Appreciation

CORPORATE SECTOR

In the market

Rustom Mills & Industries

Rustom Mills and Industries Ltd (Regd Office: Brij House, opposite Gujarat High Court, Stadium Road, Ahmedabad 380 014) is offering to the public 140,000 fully secured debentures of Rs 100 each for cash at par totalling Rs 1.40 crores. At the same time it has reserved 60,000 debentures of like value for its equity shareholders, directors, their associates, friends and relatives and employees. In all, thus, Rs 2 crores are proposed to be raised between August 10, 1981 and August 21, 1981 during which period the subscription list will be kept open. In any case, the list will not close before August 12, 1981. The proceeds will finance the company's modernisation programme.

Rustom Mills has had a chequered history. It was a sick unit when Mr Prafull Anubhai took over the same in 1967 and under his stewardship the company soon turned the corner and began making brisk profits which during the last ten years have risen by 594 per cent to Rs 118 lakhs in the wake of the 534 per cent increase in turnover to Rs 1,604 lakhs. Mr Prafull Anubhai told newsmen in Bombay that right from the time the company was taken over, he went in for a modernisation programme and for identifying right product-mix for the company. This has paid rich dividends, so much so that the company came out with four bonus issues in the last ten years. He pointed out that an investor who held ten shares in 1969-70 in the company was now effective holder of 120 shares. In the case of new debentures, the holder will have an option to convert Rs 30 into two equity shares of Rs 10 each at a premium of Rs 5 per share after one year from the date of allotment (the present net worth of a Rustom equity is said to be Rs 37).

Mr Prafull Anubhai said the company holds a licence to expand spindle capacity by 14,000 from the current 26,000 and also proposes to double the number of Sulzer looms to 24. Besides, the company has been managing a previously sick co-operative spinning mill with 25,000 spindles at Visnagar and has been buying its entire production on contract. Negotiations for take-over of yet another sick textile unit have been completed, but the seller has failed to fulfil the conditions required of him. He said that the company had already diversified into rubber products and paddy dehusking rollers made by the rubber division have established their name in the market. The division also manufactures processing rollers and other moulded products. Very shortly commercial production of textile costs and aprons will begin and the manufacture of two-wheeler and three-wheeler tyres and tubes is also on the cards. Mr Prafull Anubhai pointed out that the profitability of the rubber division was much better than that of the textile division.

Garware Plastics & Polyester

Garware Plastics and Polyester Ltd (Regd Office: L-6, New Industrial Estate, Chikalthana, New Aurangabad 431 003) will enter the capital market on August 3, 1981 with a public issue of 33,13,980 equity shares of Rs 10 each totalling Rs 3.1398 crores to be issued at a premium of Rs 3 per share. Thus, in all the public issue is expected to yield Rs 4.308174 crores. Side by side 1,74,420 equity shares of Rs 10 each are being reserved for issue at a premium of Rs 3 per share to employees and business associates of the company.

Mr B. D. Garware, chairman of the company, told newsmen in Bombay that the proceeds of the issue will be used to partly finance a Rs 11.40-crore project to expand the existing polyester film capacity from 600 tonnes to 1,500 tonnes a year and to set up a new captive plant for the manufacture of polyester chips, the raw material for making polyfilm. Thus, it would be a backward integration for the company. Mr Garware pointed out that expansion of film capacity, being undertaken at Chikalthana, was expected to be completed by the beginning of 1982. The polyester chip plant, being set up at Walunj, also in Aurangabad, should be in production by the end of 1982, he added.

Mr Shashikant Garware, managing director and vice-chairman of the company who has been the spirit behind the project, said that the company had become a pioneer in the manufacture of biaxially oriented polyester film not only in India but also in South East Asia. Enquiries from abroad had come in soliciting technical know-how of the company and these were being processed. He pointed out that polyester film had unlimited applications and so marketing of the product was no problem. Immediately, however, the product had established its application in x-ray, audio/video/computer tapes, cassettes, offset printing, electric motor insulation, cable wrapping, packaging and so on. Continuous R&D efforts were on to find newer and newer applications at the Nasik plant.

Mr B. D. Garware expected total turnover of the company to go up to Rs 40 crores after completion of the project as against about Rs 25 crores in 1980. The company's was an established name in the Indian and overseas markets and it had a consistently good record of performance. The present block value of equity share was about Rs 18 as against the face value of Rs 10. He hoped the shareholders would not have to wait long for a good return on their investment.

Wimco

Wimco Ltd (Regd Office: Indian Mercantile Chambers, Ramjibhai Kamani Marg, Bombay 400 038) will enter the capital market on August 3, 1981 with a public issue of 5 lakhs non-convertible secured redeemable debentures, bearing interest at 13.5 per cent per annum, of the face value of Rs 100 each to be issued at par. The proceeds of the issue will be used to meet part of the company's working capital requirments for a wide range of activities like chemicals, paper, engineering, electrodes and foods. The special features of the debenture issue are the willingness of the company to buy them back at par after the first year, a return of 14.5 per cent in 1981 and each successive year in which equity dividend exceeds 14 per cent, and upward revision of interest rate in line with prevailing debenture interest rates.

Other developments

Mafatlal Fine maintains

The Mafatlal Fine Spg & Mfg Co Ltd has reported higher sales for the year ended March 1981 at Rs 85.44 crores compared to Rs 70.30 crores in the previous year. The net profit, after providing Rs 1.97 crores (Rs 1.59 crores) for depreciation and Rs 32 lakhs (Rs 1.28 crores) for taxation, amounted to Rs 2.98 crores (Rs 2.50 crores). The equity dividend recommended for the year under review is 17 per cent (same) payable on the higher capital resulting from 1 : 3 bonus issue during 1980-81. An amount of Rs 1.08 crores (Rs 74 lakhs) is transferred to investment allowance reserve and Rs 20 lakhs (Rs 80 lakhs) to general reserve.

TELCO: Bonus shares proposed

Tata Engineering & Locomotive Company Ltd has reported higher sales for the year ended March 1981 at Rs 609.65 crores compared to Rs 448.27 crores in the previous year. The net profit, after providing Rs 16.16 crores (Rs 13 crores) for depreciation, was Rs 24.37 crores (Rs 17.62 crores). The equity dividend recommended for the year under review is 20 per cent (same). An amount of Rs 6.65 crores (Rs 6.30 crores) is transferred to investment allowance reserve and Rs 11.47 crores (Rs 5.07 crores) to general reserve. Exports during the year under review were Rs 52.43 crores (Rs 46.95 crores). The company proposes to issue 2:5 bonus shares, subject to necessary approval.

Ramon group enters travel agency business

The Ramon group of companies has added another activity to its business by entering the travel agency business through their new travel wing—Elbee Services Private Ltd. The number of companies in the group thus rises to eleven.

Apart from the usual travel agency services, Elbee Services has introduced a scheme whereby travellers can fly at any time they like and pay subsequently. This scheme offers credit facility on reasonable terms. The company also intends to provide a broad-based service including rail bookings, car hiring at different places and hotel reservations to the customers who are undertaking group travel or foreign trips.

Saraswat Co-operative Bank: Higher profit

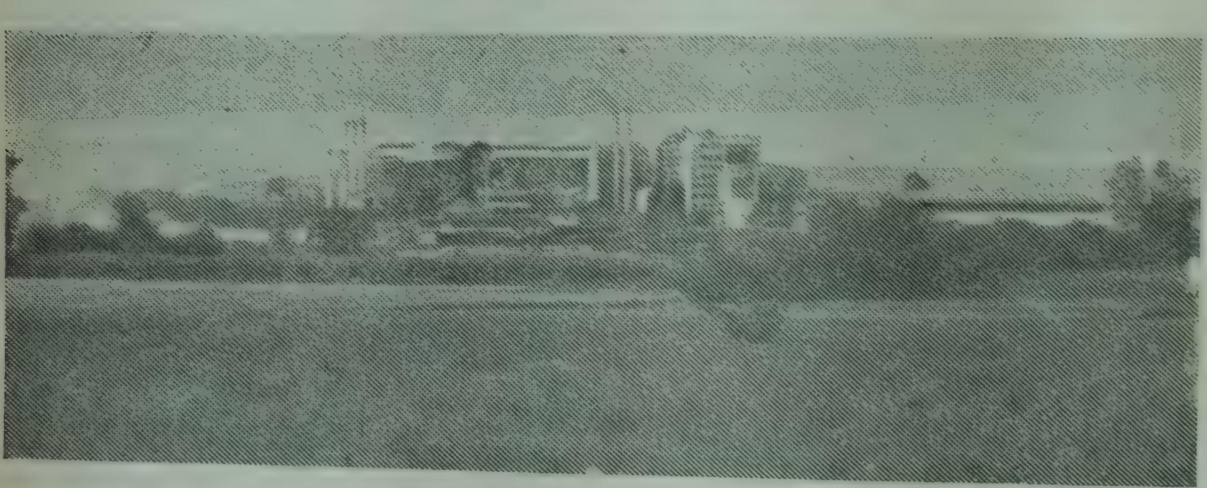
The Saraswat Co-operative Bank Limited has recorded all round progress during the year ending June 30, 1981. The net profit alone rose by 45 per cent from Rs 35.11 lakhs in the preceding year to Rs 51.16 lakhs for the year just ended. The paid up share capital has gone up from Rs 12 lakhs to Rs 156 lakhs, an increase o 30 per cent. The deposits have registered an increase of Rs 1,312 lakhs ove the last year's figure of Rs 4,911 lakh (27 per cent) and stand at Rs 6,22 lakhs. Advances have gone up by R 355 lakhs (12 per cent).

The Committee of Managemen proposes to recommend dividend o 12 per cent per annum being the maximum permissible under the Maharashtra Co-operative Societies Act, 198

With the additional four branche opened during the year under repor the branch strength of the bank stand at 34 out of which one each is in th backward areas of Marathwada an Konkan.

The bank has liberalised its schem of financial assistance to technocrat from Rs 0.50 lakhs to Rs 1.50 lakh with interest at 12½ per cent per annum An arrangement with Housing Development Finance Corporation to sponsor applicants in need of housing finance for loans up to Rs 0.70 lakhs wit interest at 12½ per cent per annum i another step in the direction of meeting housing needs of its depositors an making long term finance available t them.

Mysore Papers' newsprint unit



The Rs 145-crore expansion project of the Mysore Paper Mills Ltd., at Bhadravati in Karnataka has gone on stream. It started trial production on its Beloit Walmsley machine with deckle width of 7.1 m, designed to reach a speed of 750 metres per minute. Now, three years and nine months after receipt of industrial licence from Government of India, the largest paper machine in the country has started forming a continuous web of paper.

Pre-commissioning activity had started as early as March 1981, when MPM was steadily gearing into a state of readiness each of the various inputs necessary for the production of newsprint. These are: power at 3.3 kv and 440 volts and the DC power to run the main drive motor of the paper machine, steam at 4 kg/sq cm at the desired throughput, compressed air at 7.5 kg/sq cm in desired quantity, vacuum pumps to create vacuum on the paper machine, fresh water at a pressure of 3.5 kg per sq cm pulp and the manpower.

The heartening news of Mysore Paper Mill starting trial production comes at a time when the newsprint situation in the country continues to be bleak with demand reaching 3,50,000 tonnes per annum and installed capacity remaining at 60,000 tpa.

While the start-up production in the MPM newsprint project has been programmed to be with imported chemical and thermo mechanical pulp, it is expected that by August 1981, the captive pulping system in the mills will meet the required quantities of pulp to ensure the gradual increase in production. With the commercial production of newsprint by MPM a few months hence, 60 per cent of capacity will have been reached the very first year of production.

Forthcoming company meeting

Squaring up business

Bombay, July 18

Dalal Street was finally open for trading on July 17 after suspension of operations for about two weeks. The trading was, however, in the nature of squaring-up of outstanding business in the case of 'A' group shares and spot delivery basis in 'B' group shares.

The suspension of operations was mainly due to labour problem created by the staff members of sharebroking firms and partially due to payment difficulties faced by certain brokers. According to the market sources, the 16th account was settled and the way is paved for normal trading from next week. The last business in the nature of squaring-up business took place on July 2. The last regular trading, however, took place on June 26.

The equity sentiment remained subdued when trading was resumed and share prices declined sharply on bull offerings as well as short selling. Fears of further dose of anti-inflationary measures by the Government induced marketmen to unload part of their holdings.

Century opened on a hesitant note at Rs 783 against the previous official closing of Rs 785 and the scrip started moving up in later dealings to Rs 791. The closing was, however, at Rs 789 on scattered profit-taking.

Despite the improved working results for 1980-81 and two-for-five bonus issue announcement, Standard came in for offerings and the scrip yielded Rs 35 at Rs 623. Bombay Dyeing moved down from Rs 100 to Rs 94 before the price was finally placed at Rs 97. ACC, TELCO, Indian Dyestuff, Gwalior Rayon, Tata Oil, Premier Auto, Amar Dye-Chem, Tata Chemicals, Scindia and Hindustan Motors lost marked ground. Tata Steel was quoted at Rs 298 xd against Rs 298.50 on cd.

In the cash section, Nirlon advanced from Rs 73 to Rs 80 on official announcement that the board might consider the bonus issue at the board meeting on July 23. Profit-taking, however, brought down the price to close unchanged at Rs 73. Baroda Rayon dropped to Rs 347 from Rs 362, Indian Rayon to Rs 76.50 from Rs 83 and GSFC to Rs 428 from Rs 450. Indian Organic was quoted at Rs 335 xd against Rs 345 cd. MICO, however, was in the limelight on sustained buying on hope of bonus shares.

The normal trading was on June 26, after which the market was open on July 2 and July 17 for squaring - up of outstanding business.

Market Gossip

Cotton imports?

THERE has been a revival of the proposal to import cotton, particularly in the medium and short staple range, the new Textile Commissioner, Mr R. K. Thakkar, is already reported to have told the Southern India Mills' Association (SIMA) that the Government is considering the proposal made by the Indian Cotton Mills' Federation on the subject. The Federation's original proposal sought the import of one million bales of cotton to make up the anticipated shortfall in stocks during the lean period, even based on the figures computed by the Cotton Advisory Board. The Cotton Corporation of India, with its huge unsold stocks, managed to put forward its view that imports were not necessary and there was enough cotton in the country. In case imports are allowed, the CCI fears that it would have to sell its stocks at lower and lower prices.

Soon the Bombay Millowners' Association came up with the bright idea of going fine and saving on foreign exchange. It said that there could be conservation of cotton use to the extent of five lakh bales. Then, feelers were set out indicating the official stand that a maximum of three to four lakh bales of cotton imports could help the mills tide over the immediate crisis. This was further whittled down to two lakh bales. A delegation of the CCI recently visited the Far Eastern region and is back but the results of the trip are not known. The season is fast coming to a close. Even if cotton suppliers are located, when will the country get the cotton? Imported cotton could reach us when new crop indigenous cottons are entering the market. Of the two, which will the mills prefer?

UPASI ignored

THE United Planters' Association of Southern India (UPASI) is obviously disturbed by the way the Coffee Board has been re-constituted recently. It has complained that the panel of names submitted by the representative growers' association in response to the process of consultation that is statutorily required has been bypassed and considerations other than merit, accountability and representative status have entered into the picture. There is one strong point that UPASI makes. Unlike other commodity boards, the Coffee Board is the sole board charged with the task of marketing the entire produce of coffee growers. What it amounts to, it says, is a surrender of their fundamental rights to carry on their trade or business. This was the reason why in the past producers were not only accorded majority representation on the board but their representative associations too had the right to nominate grower members to the board. UPASI always suggested the names of its representatives on the board after the widest possible internal consideration with the various regional and local associations but the Government has now thought it fit to overlook its considered views in the constitution of the Coffee Board.

Sone Valley: Accountless meeting?

SONE Valley Portland Cement Co Ltd is scheduled to hold its annual general meeting on July 31, but will not present any accounts for the consideration of shareholders. This is because the company, whose last working year has ended on December 1980, has not yet been able to finalise the accounts in view of the labour unrest and lock-out at its plant. With the intervention of the Bihar Government, the company lifted the lock-out on May 22 and its office began functioning from May 26 followed by production on June 8. Because of these circumstances the management of the company had sought permission of the Registrar of Companies to hold its annual general meeting some time in September next, but it was given only one month's extension and accordingly the meeting will now be held on July 31. Since the accounts have not yet been finalised the meeting is expected to be a routine one and likely to be adjourned after considering other items.

Groundnut oil mills paralysed

EVEN in the midst of reports that Gujarat, the principal groundnut producing state in the country, will reap a bumper groundnut crop of 23 lakh tonnes during 1981-82 as against nearly 16 lakh tonnes last year, groundnut oil prices in all the major markets of the country—including Rajkot—were soaring during the first fortnight of July. The announcement of higher allocation of imported edible oils for direct distribution to the consumers for July at 47,000 tonnes as compared with 42,000 tonnes released in June also did not have any salutary impact on prices. The fixation of profit margin on sales of groundnut oil by the Gujarat Government from July 1 has not only not achieved the professed objective of controlling the rise in the prices but has become instrumental in providing a fresh lease to the bullish phase. Following the fixation of profit margin for millers at 0.5 per cent, for wholesalers at one per cent and for retailers at two per cent, the wholesale price of groundnut oil in Rajkot increased by almost Rs 100 per quintal during the first fortnight of July to reach a new record of Rs 1,425. In Bombay market also prices increased by Rs 85 to Rs 1,535 per quintal during the same period. As on July 15, the 15.5-kg tin of groundnut oil in Bombay was quoted at Rs 270. Even in Rajkot it was as high as Rs 260. This was expected to reach a new high of Rs 300 around Diwali (October-end) according to market circles.

The crushing industry in Gujarat, as was feared by the trade sources, has almost come to a grinding halt in that only 5 per cent of the mills were working. According to trade sources, the measure taken by the State Government was impracticable for various reasons. Without any ceiling on the prices of groundnut—the raw material for the oil—how can the profit margin for groundnut oil be fixed? Not only that, the raw nut prices were fluctuating practically every day. Added to this was the fact that in the absence of any such scheme operating in other states, raw nut was likely to be diverted to other states.

Cotton prices steady

Bombay, July 13

Quietly steady conditions continued to prevail in the spot cotton market during the past week with limited business passing. The progress of the monsoon so far has been noted with satisfaction. The spinners are, by and large, not inclined to extend their commitments, pending a clearer picture about the probable crop assessment for the ensuing season.

The Government of Maharashtra continued to make frantic efforts to convince the Centre about the need for the extension of the monopoly procurement on account of its vital importance to the prosperity of the cotton growers. Indications are that the Government's efforts would result in some positive announcement about the scheme by the Centre before the end of the month.

The Cotton Corporation of India has already initiated a tion to explore the prospec of getting cotton impors fro some of the countries u. t Far East. The quantity cu rently talked about is two lak bales. The textile industr has originally sought an impo of ten lakh bales of short st ple cotton with a view avoiding a critical position regard to stocks in the lea months before the arrival the new crop.

Now that the Governme has accepted the need for pu ting up the retail selling p ces of controlled cloth, indu try circles are hoping that t authorities would also so take a similar decision in r gard to the cheap cloth schem

The cheap cloth scheme wa introduced in September 19 and the maximum retail pri was fixed at Rs 6.36 per metr There has been an all-roun cost escalation, with speci reference to the strident a vance in cotton prices durin the last few months. the circumstances, the mill i dustry is of the view that suitable mark-up in price should be granted if the chea cloth scheme should be cont nued. In the absence of an upward revision in prices, th scheme should be dropped.

The following has been th trend of prices of some of th leading varieties :

(Rs. per candy)

	July 10	July 3
Digvijay	5,050-5,150	5,050-5,15
Kalyan	4,750-4,850	4,750-4,85
Saurashtra CO2	4,850-5,000	4,850-5,0
Shankar 4	5,850.6,150	5,850-6,20
Maharashtra H 4	5,400-5,550	5,400-5,55
MP H4	5,300-5,450	5,250-5,40
MP Y1	4,900-5,000	4,900-5,00
MP 1007	5,150-5,250	5,150-5,25
MP A 51/9	5,100-5,200	5,050-5,15
MCU 5 Guntur	5,900-6,100	5,800-6,05

Downtrend in yarn

Bombay, July 1

A steady and downwar trend was noticed in the loca yarn market during the pas week. While the prices 120D NRC and 120D CR de lined by Rs 1.65 and Rs 1.3 to Rs 52.31 and Rs 52.60 res pectively, the prices of 150 NRC, 150D CR, 100D SIV an 150D acetate remained stead at Rs 51.21, Rs 50.66 Rs 55.0 and Rs 41.85 respectively.

Groundnut oil scales new peak

Bombay, July

Groundnut oil price scaled fresh peak at Rs 153.92 per 1 kg during the past week o encouraging advices from pr ducing centres and limited a

ESCORTS LIMITED

NOTICE

It is hereby notified for the information of the public that ESCORTS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval of the establishment of a new undertaking by setting up a Floating Dock to carry on the business of repairing and servicing of ships upto 25,000 DWT. Other particulars of the proposed new undertaking are as under :—

(i) Name of the proposed undertaking : The proposed undertaking will be a Division of Escorts Limited.

(ii) Name(s) of the persons or authority/authorities proposing to establish new undertaking : ESCORTS LIMITED

(a) Management structure of the applicant undertaking : The Board of Directors of the applicant undertaking companies of:

Mr. H. P. Nanda, Chairman and Managing Director.
Mr. Rajan Nanda, Vice-Chairman and Joint Managing Director.
Mr. C. K. Hazari, Joint Managing Director.
Dr. Bharat Ram.
Mr. D. N. Davar Nominee, Industrial Finance Corporation of India.
Mr. S. Bhoothalingam.
Mr. J. M. Shrinagesh.
Sodhi Kartar Singh.
Mr. S. N. Bilgrami.
Prof. Ravi John Matthai
Mr. S. Ranganathan.
Field Marshal Sam Manekshaw.
Mr. Parmeshwar Sahai.
Mr. Anil Nanda.
Mr. S. Hariharan.

(b) Management structure of the proposed undertaking : Same as the applicant undertaking.

(iii) Capital Structure—

(a) The Applicant undertaking

(Rs. in lakhs)

Authorised Capital	2,000.00
Issued Capital	1,420.72
Subscribed and paid-up capital ..	1,418.41

(b) The proposed undertaking : Same as the applicant undertaking.

(iv) Proposed location of the new undertaking : In the State of Maharashtra.

(v) Brief outline of the cost of Project, the Scheme and source of finance : It is proposed to purchase a Secondhand Floating Dock capable of taking ships upto 25,000 DWT.

The estimated cost of the project would be Rs. 1,750 lacs which is proposed to be financed from loans from Indian/Foreign financial institutions and from Company's internal accruals.

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, under advice to the Company, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

New Delhi-110 001

rivals in the oilseeds market during the past week. The price, however, reacted feebly to Rs 152.88 on the concluding day of the week mainly because buyers were reluctant to lift stocks at higher prices. During the past two weeks, the net gain was Rs 16.13 per 10 kg, including 4 per cent sales tax.

Groundnut also hardened further. Karad bold and Saurashtra bold improved markedly by Rs 32 each to Rs 624 and 629 per 100 kg, while Saurashtra quality firmed up by Rs 31 to Rs 633 per 100 kg.

Imported oils also flared up in view of the firmness in groundnut oil. Besides, reluctance on the part of STC to deliver any stocks through fair price shops on ration cards also pushed up the prices. The stocks with private parties were limited and as a result prices flared up. Soyabean spurted by Rs 7.52 to Rs 143.52 and RBD by Rs 4.80 to Rs 121.80 per 10 kg. Palmoleine was, however, marginally lower by Rs 1.48 at Rs 143.52 on moderate business.

Castorseed and oils ruled quietly steady. Madras small rose by Rs 12.50 to Rs 324.50 and Kanpur bold by Rs 14 to Rs 316 per 100 kg, including 4 per cent sales tax. In the previous week, castorseed had not attracted sales tax, while in all the other cases sales tax is in force with effect from the previous week. Castor commercial oil lost 65 paise at Rs 68 and BSS oil 25 paise at Rs 73.25 per 10 kg because export demand was poor.

Linseed rallied on encouraging advices from the north. Linseed bold went up by Rs 18 to Rs 478 per 100 kg and its oil by Rs 1.70 to Rs 121.70 per 10 kg.

Activity in cakes was limited. Export inquiries were poor with the result prices were, by and large, steady.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :—

	11-7-1981	4-7-1981
G. nut		
Karad bold	624.00	592.00
G. nut oil	152.88	145.75
Cast. Md. Sm.	324.50	312.00
Cast. oil com.	68.00	68.65
Cast. oil BSS	73.25	73.50
Linseed bold	478.00	460.00
Linseed oil	121.70	120.00

Grains improve

Bombay, July 13

Barring a fall in masoor dal, cereals, coarse-grains and pulses ruled steady to firm during the past week.

Among cereals, wheat recorded a further rise on limited supplies and good retail demand. Sellers were reserved. Saurashtra variety of wheat was in demand Rs 8 higher at Rs 215-238 per quintal. Supplies from Gujarat were hampered by heavy rains. Superior variety improved by Rs 3 to Rs 295-330. The announcement of the import of 1.5 million tonnes of wheat had little impact on prices.

Rice ruled steady. Basmati variety was traded at Rs 450-600 per quintal. Surti kolam was sold at Rs 340-400 per quintal.

Activity was limited in coarse grains. The undertone was steady to better because of poor supplies and limited stocks. The price of coarse grains persisted at previous week's level. Jowar fetched Rs 185-225 per quintal. Bajra was offered at Rs 165-230 per quintal. Maize ruled at Rs 155-160 per quintal.

Among pulses, gram recorded a further rise on poor arrivals and encouraging advices from up country centres. Sellers were reserved. Gram gained Rs 17 to Rs 400-410 per quintal on good demand. Masoor dal receded on slack demand. Sellers were keen.

The undertone was hesitant. The price of masoor dal suffered a setback of Rs 10 to Rs 490-495. per quintal. Moong (chumki) flared up by Rs 10 to Rs 425-450 per quintal on brisk demand and paucity of supplies. Urad (Khandesh) and tur dal lacked fresh support and ruled steady at Rs 320-325 per quintal and Rs 485-575 per quintal respectively.

NOTICE

THE ASSOCIATED CEMENT COMPANIES LIMITED

(Registered Office : Cement House, 121, Maharshi Karve Road, Bombay-400 020)

(General Notice under the Monopolies and Restrictive Trade Practices Act, 1969)

Sugar hesitant

Bombay, July 13

The price of sugar C-30 grade moved down marginally as keen unloading despite restricted arrivals lowered the price by one rupee to Rs 650-660 per quintal. The undertone was hesitant. Upcountry demand was weak. Activity in the local market was moderate. The price of sugar C-30 as on July 11, 1981 was lower by Rs 102 per quintal than on the corresponding date a year ago. The State sugar factories lowered their quotations to Rs 610-613 per quintal. The wholesale market received 19,847 bags and disposed of 20,000 bags. The weekend stocks amounted to 2,290 bags compared to 2,443 bags at the previous week end.

Khandsari was quoted at Rs 550-600 per quintal. The market received 252 bags sold 555 bags during the week. At the end of the week stocks with the dealers dwindled to 472 bags from 775 bags at the previous week end.

TAX PAYERS !

SECURE PROMPT CREDIT FOR YOUR INCOME TAX PAYMENTS

The Income-tax Officer gives you credit for your tax payment on the basis of the counter-foil of the challan received from the authorised bank where you make the payment.

Surely, you would like your tax payments to be credited to your account in the records of the I.T.O. promptly and fully.

THEN CHOOSE THE APPROPRIATE CHALLAN FORM FOR EACH PAYMENT

There are separate challan forms for the various types of income-tax payments. These are :

For payment of	*No. of challan*	*Colour of the band on challan form*
Advance Tax		
By companies	1 (ITNS 35A)	Red
By others	7 (ITNS 35)	Blue
Self-Assessment Tax		
By companies	3 (ITNS 166)	Red
By others	11 (ITNS 166A)	Blue
Tax Deducted at source		
From salaries	9 (ITNS 191)	Blue
From other payments		
Made to companies	2 (ITNS 39A)	Red
Made to others	8 (ITNS 39)	Blue

THE NUMBER OF CHALLAN IS INDICATED ON THE TOP LEFT HAND CORNER.

For payment of tax due on regular assessment, the appropriate challan will be supplied to you by the income-tax Officer.

Use of a wrong challan may result in misclassification and consquent difficulty in giving prompt credit for the tax payment.

FILL THE CHALLAN FORM COMPLETELY AND CORRECTLY

And make sure you write legibly on all foils of the challan :

- Your name and address
- I.T.O.'s Wards or Circle where you are assessed or assessable. In case you are a new assessee, mention "NEW CASE" also on the top of each foil of the challan.
- The amount of income-tax and surcharge separately.
- Your Permanent Account Number/GIR Number.
- Assessment Year.

A mistake or omission may result in undue delay in giving credit to you for your tax payment.

Correct entries in the Department's Books are as important as prompt payment of taxes. Take due care to ensure both.

Gold subdued, silver erratic

Bombay, July 13

A subdued tendency in gold and an erratic trend in silver marked trading in the Bombay bullion market during the past week.

Standard mint gold opened at Rs 1,645 per 10 gms and closed at the same level. Silver (.999 fineness) opened at Rs 2,350 per kg and dropped to Rs 2,320 per kg on the same day. It, however, firmed up subsequently to close at Rs 2,405 per kg.

Money comfortable

Bombay, July 13

Conditions in the Bombay short-term money market continued to be comfortable during the past week. Interest rates for both notified and commercial funds opened at 9 per cent and dropped to as low as 3 per cent on Friday (July 10). The rates, however, firmed up on the last day to close at 7 per cent

Aggregate deposits cross Rs 40,000-crore mark

Bombay, July 13

With an increase of Rs 241.49 crores during the week ended July 3, 1981, aggregate deposits of all scheduled commercial banks crossed the Rs 40,000-crore mark to reach Rs 40,168.73 crores. Bank credit expanded sharply by Rs 261.72 crores to Rs 26,555.78 crores. While the balances of banks with the RBI declined by Rs 119.03 crores to Rs 4,397.79 crores, their borrowings from the RBI went up by Rs 5.78 crores to Rs 570.04 crore.

A journey to Himachal

Concluded from page 200

commentary, cold drinks, tourist literature that would make a bus journey very enjoyable.

The State is famous for apples, pears, peaches and some other summer fruits. The mainstay however is apple. It is believed that Kulu apples are far more delicious and nutritious than the varieties grown in Kashmir. The fruit research station near Mashobra has about 145 varieties under study and promotion. On enquiries with small-orchard owners, however, they were not fully aware of the services available with the horticulture department or the research station and they are content with ordinary varieties with a limited shelf life, and whatever prices the middlemen offer! The growers could certainly get far more for their produce if there were a chain of co-operatives running finance, cold-storage, transport and marketing facilities. I am waiting for the day when these fresh apples would be flown directly from the Kulu airport to state capitals in Europe, where Israel seems to have a monopoly of supplies of flowers, fruits and vegetables.

Flowers offer almost unlimited scope in the hospitable environs of Himachal. It needs the co-ordinated efforts of all concerned to make it bloom.

The valleys of Himachal Pradesh offer countless attractive spots for skiing, inns, trekking, fishing, camping, lodges, cable-car journeys, transportation etc. You name it—they have it.

When would the 'Hanuman' know about his own prowess?

Beyond headlines

A journey to Himachal

By N. K. SOMANI

TRAVEL in India is a horrendous exercise by itself, especially if you are planning about a month's vacation in the summer with your family. We had started to think about our May vacation way ahead in early March. (Sept-Oct is far more suitable for leave and travel, but our educational system does not permit children to avail of that period). This year, our hearts were set to explore Himachal Pradesh which is truly renowned for its majestic natural splendour. With the mighty Vyas, Ravi Chenab etc flowing through a large part of the State and with several perenially snow-clad ranges rising above the Himalayan clouds, the area is fairly dotted with coniferous woods and could be truly developed better than Switzerland. This, alas, is yet not to be.

Tourism in our country has unfortunately been pushed into a third-rank ministry—both in terms of the ministerial appointments and annual allocations from the Central Government over a long period of time. Even if the whole country cannot be developed overnight for domestic and foreign tourists the Himalayan belt (with due apology to George Fernandes who is reported to have expressed an opinion that the country should be closed to foreign tourists for the next ten years!) provides at once a God-created opportunity. This magnificient, almost unbroken chain of natural splendour from Kashmir to Darjeeling at an average altitude of 1500-3000 metres, is already a victim of human indifference and cruelty—both in terms of its abject neglect and the systematic destruction of forests in the belt. I was sorely depressed by the unrelieved sight of brutally cut and murdered trees, whose mute stumps bore enough testimony to our lip sympathy to grow more trees and the 'Chipko Andolan'. The average age of the trees, as per local information, was 30-100 years and the signs of looking after or adding were very few, if any.

I have always wondered as to why Himachal cannot make tourism, fruits and flowers and forestry produce as its mainstay. From what little I saw in 23 days' sojourn in various parts of the State, I was emboldened to offer to two senior government officers of Himachal Pradesh that any prvate individual like me, can make Himachal the richest State in the country in 10 years if he were given adequate authority! They 'encouraged' me by saying that I should make appropriate noises in Delhi and Simla, with the appropriate governments!

To come back to the beginning. It took me three weeks of cajoling and reminders to obtain badly produced, out-of-date, poorly cyclostyled information sheets from the Delhi office of Himachal Pradesh Tourism. Our request for accommodation (not at Simla) at Wildflower Hall (a charming hillock near Kufri) in a family cottage for 12 days and a similar spell at Manali was telegraphically requested in early April. We also wanted six first class tickets by railway leaving Delhi on April 30 for Kalka. Up to the day of departure, only four tickets were confirmed and a representative had to spend the best part of a hot four hour afternoon at Delhi station to get the other two! About accommodation, I sent (reply-paid) telegrams to Himachal Pradesh Tourism, Delhi, their head office at Simla and the area managers at Kulu for these cottages. This was followed by personal visits at Delhi and letters to Kulu and Simla. Inspite of incessant follow-ups, all the assurance we got was two days in the hotel complex at Wildflower Hall (not the cottage complex) and two days at Hotel Beas at Manali (again no cottages!). We were keen on our cottages since we are vegetarians and had planned to take our cook-cum-handyman with us. One can only stomach outside food only for a few days.

Undaunted by sketchy response, we booked our seats on Indian Airlines for Delhi (taking advantage of the newly announced and imaginative LTC concession fares for the two of us and the four children—not all mine—travelling at student concession rates). Almost two hours on this day were, however, wasted in collecting a few thousand rupees' worth of travellers cheques from one of the nearby Stat Bank branches. I had sent two assistants in advance with cash to ensur that I would not be detained for lon on my day of departure. However, i seems banks always do a great deal o favour while dealing with anyone o any matter!

The journey to Simla was uneventful. Simla appeared as a mini Connaught Place at most times, the entir fashionable lot of tourists being perpetually on the Mall and the Ridge We were fortunate to be given a famil cottage, after a wait of two days—a event that was not to be confirmed into reality until we landed.

Wildflower Hall—as the name suggests—is situated amongst countles flowers, largely white and yellow an several smaller ones. The view fro this hamlet is breath-taking (when th skies allow), since you can clearly se several peaks including Badrinath fro the garden cafe of the hotel and fro many other points. The summer retreat of the President of India is almos next door.

Although the place, Wildflowe Hall is so exquisitely situated, the service, cleanliness and maintenance i far from desirable. The hot-wate geysers in our two cottages broke dow several times. It occupies a very larg estate, but during power failures, ther are no emergency lights. Small improvements like these will go a lon way to make the place first rate.

Public toilets in India are the mos difficult items to maintain. This ha always been beyond my understandin as to why we can never conquer thi 'super-technology' to provide an maintain clean toilets. First of all, the are very few and even they are totall unusable. Himachal toilets are no exception. In every single public toile that one was forced to enter, one ha to come out nauseated and angry b the floating beauty and clogged pipes

Himachal truck and bus driver take their lessons from the tough Punjabi neighbours next door. I believ the rate of accidents in this State i quite high, but police and transpor authorities seem to be blissfully oblivious of all this. The fleet of buses i indeed in a pitiable condition. So muc for the tourist lip-service! A little mor attention could provide lovely smal tourist buses with music, recorde

PEOPLE

Modi

Mr B. K. Verma has been appointed group executive of the State Trading Corporation of India, New Delhi.

Mr D. Ramanujam has been elected president of the South India Film Chamber of Commerce.

Mr Surender Nath has been elected president of the Federation of Automobile Dealers Association.

Mr V. K. Modi has been re-elected president of the All India Rubber Industries Association for the ensuing year.

Mr A. C. Muthia has been elected president of the South India Sugar Mills Association.

Tandon

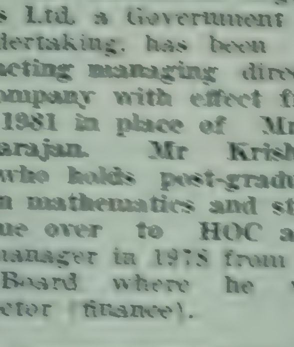
Mr V. C. Tandon, deputy general manager (public relations), Bharat Heavy Electricals Ltd, a Government of India undertaking, has been re-elected chairman of the Public Relations Society of India (Delhi chapter) for the second consecutive term. Mr V. S. Chopra was elected vice-chairman, Miss Anita Takru secretary and Mr M. R. S. Mani treasurer.

Krishnamurthy

Mr H. Krishnamurthy, director (finance) of Hindustan Organic Chemicals Ltd, a Government of India undertaking, has been appointed acting managing director of the company with effect from July 23, 1981 in place of Mr P. N. Devarajan. Mr Krishnamurthy, who holds post-graduate degrees in mathematics and statistics, came over to HOC as a general manager in 1978 from the Railway Board where he was joint director (finance).

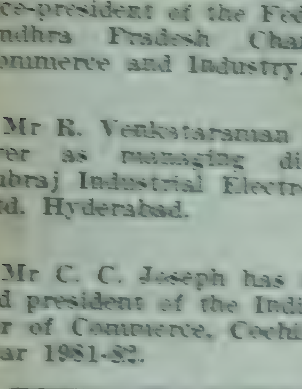
Mr. R. N. Jalan has been elected vice-president of the Federation of Andhra Pradesh Chambers of Commerce and Industry.

Mr R. Venkataraman has taken over as managing director of Subraj Industrial Electronics (P) Ltd, Hyderabad.



Joseph

Mr C. C. Joseph has been elected president of the Indian Chamber of Commerce, Cochin, for the year 1981-82.



Sarwal

Dr Vasant Pethe, an internationally reputed demographer-economist, has joined as professor and director of the Nehru Institute of Social Studies, Pune.

Dr K. P. Parameshwaran has taken over as managing director of Orissa Industrial and Technical Consultancy Organisation Ltd.

Mr Karan B. Sarwal of Thomas Cook (India) Ltd, Bombay, has been re-elected president of the Air Cargo Agents Association of India.

THE WEEK

Under an ordinance promulgated on M the Union Government armed itself with powers to ban strikes in a number of services industries, including those in private sector, it considers or may consider as essential. (See edit, special reports and document).

The Madhya Pradesh Government has shed the 50 per cent levy on the sale or wheat by traders within the State. The levy wheat for sale outside the State, however, remains.

Import of vegetable fats has been through the State Trading Corporation, while of art and chrome paper and board have decanalised.

By an ordinance issued on July 26 the Gov ment has raised the effective customs duty on port of edible oils to 150 per cent ad valorem. Government had earlier raised import duty on types of vegetable oils.

Iraq has found the Donimalai iron ore not be of the quality it desires and, therefore, has tur ed down India's request for funds for setting up pelletisation plant. India had offered to pay the help in the form of pellets.

The Federation of Indian Chambers of Co merce and Industry has submitted an export plan the Union Commerce Ministry aiming at 22.85 p cent increase in exports to Rs 8,600 crores du 1981-82. This target is Rs 200 crores more than recently announced official target of Rs 8,400 cro Of the 1981-82 exports, sugar is expected to accou for Rs 150 crores, according to the FICCI plan.

The monopoly cotton procurement scheme the Maharashtra Government will be revive shortly with certain modifications desired by th Union Government. According to the Chief Mi ster, Mr A. R. Antulay, the modalities of the ne scheme will be worked out on August 2.

The Department of Electronics of the Cent Government has invited a West German mul national to manufacture computers in India, it reported.

The selling prices of imported standard new print have been raised by Rs 480 per tonne wi effect from July 1 last.

Wholesale price index

At 279.5, the latest available wholesale pric index for the week ended July 4, 1981 showed a ris of 0.1 per cent over the preceding week and 10. per cent over the year.

Money comfortable

Conditions were more or less comfortable in th Bombay short-term money market as of Monda (July 20). Both notified and commercial fund were renewed at eight per cent. Fresh money wa also transacted at eight per cent. The rates close at seven per cent.

COMMERCE

Wages of labour irresponsibility

THE assumption of power by the Central Government to prohibit strikes in any essential services and to hold summary trial for offences militating against the ordinance could yield dividend if it was used with full understanding of the problems involved. The essential services specified in the ordinance include the railways, posts and telegraphs, telephones, ports, aerodromes, airports, banking, production and refining of petroleum, supply and distribution of petroleum products, public conservancy and sanitation, hospitals under the Central Government and defence undertakings as well as the 42 industries in the public and private sectors listed in the scheduled category of the Industries Development and Regulation Act. The Government can declare as essential any service connected with the matters in which Parliament can make laws. The order banning strikes, when issued, would be valid for six months and can be extended further to a period of not more than six months. Once an order banning strike has been issued, any person violating the same is liable to be punished with imprisonment, besides being subjected to disciplinary action including dismissal. The offences under the ordinance would be cognisable and trials would be conducted summarily. The ordinance, embodied as an act of Parliament, would remain valid for three years. It is reassuring that the Prime Minister, Mrs Gandhi, herself has clarified that there might not be any need to extend the tenure of the measure beyond six months.

No doubt these are draconian measures involving infringement of fundamental rights of citizens. Nevertheless, considering the strategic importance of the subjects listed under essential services, governmental action preventing unwarranted disruption in such services has to be lent support. An unfortunate trend in the public sector organisations, many of which are covered by the ordinance, has been their virtual abjuration of responsibility to the public. The way some employees of the Reserve Bank of India had kept its working paralysed for weeks together recently had nothing to do with trade unionism. Even state governments have been made to complain against the Reserve Bank on that account. Yet, could the demand for employing the children of employees as a matter of routine, which was the principal demand of these employees, be termed part of any reasonable trade union action? Can an organisation like the Reserve Bank of India ever agree to such a preposterous stipulation? Yet this was not by any means the sole instance of irresponsible labour action. Indeed it has almost become customary for many of them to disrupt without notice services in the airlines, railways, ports, banks, insurance companies and elsewhere, putting thousands, nay millions, of people in jeopardy one way or the other. No nation can grow if persons working in the strategic sector conduct themselves with such low sense of responsibility. Unfortunately the trade union leadership has failed to display the capacity to control such indiscipline and has in many cases become part of it.

The exercise of powers by the Central Government under the ordinance would be supportable because such action is expected to remove the blockade to democratic functioning brought about by irresponsible disruption of necessary work. The very interest of democratic functioning would, however, require the Government also to act in a democratic manner in implementing the ordinance. The provision that a police officer can arrest without warrant any person even suspected of having committed an offence is thoroughly repugnant to the principle of democracy and natural justice. As it is, the citizens are over-exposed to police harassment and there is not room for adding to the harassment through any legislation. While placing the ordinance before Parliament for its consideration, the Government, it is hoped, would be looking into this aspect of the ordinance and remove this obnoxious provision. The Government has, by providing a time limit of six months for the validity of its order, given evidence of its awareness of the fact that a ban on strike, when imposed, cannot go on indefinitely. There should not be any need for any further extension of such an order. The period of six months should provide ample opportunity to all the parties concerned to sort out the problems and the provision for extension should be dropped. Similarly, the validity of the law incorporating the ordinance, which arms the Government with virtual emergency powers, should be restricted to one year instead of the suggested life of three years. It would be clearly inadvisable to allow a legislation, which provides for summary trial procedure, to remain on the statute book for a longer period.

Any assumption that disruption in economic activity comes only out of the indiscipline of the workers is totally invalid. During 1980 the number of mandays lost on account of lockouts was 5,904,000 compared with 7,007,000 mandays lost on account of strikes. Thus no realistic policy can ignore the threat of lockouts. The function of uninterrupted production calls for co-operation from all quarters. If the impression gains ground that the Government, while punishing the less privileged for breaches committed by them, is interested in overlooking the offences of the more powerful and richer sections of society, the all-round co-operation, which is an essential pre-condition for growth, will not be forthcoming and the very objective of promulgating the ordinance would be vitiated. The Prime Minister has done well, therefore, to make it clear that lay-offs and lockouts come under the purview of the ordinance. This is both just and sensible and the Government should make clear its intention in the bill that it proposes to bring before Parliament. If strikes are banned, lay-offs and particularly lockouts should also be banned.

There has been predictable reaction to the ordinance. While labour leaders have unequivocally condemned it, business leaders have welcomed it. It is conceded that the need for such an ordinance arose because of the widespread sense of irresponsibility of some trade unions who put their own interests before the interest of the mass of citizens of India. The ordinance should awaken the social conscience of trade unions. After all it is before the tribunal of the people that they must place their case and here an outright condemnation of the government measure would only weaken their position. This is so because, whether they like it or not, the fact remains that this measure has been most enthusiastically welcomed by the common man who is needlessly harassed by all manner of industrial actions at bank branches, insurance offices, airports and other places providing essential services.

The trade unions should realise that they cannot further the interests of workers with the public opinion hostile to them for which they should thank themselves. Business and industry leaders should have also suggested certain steps that their community could take to avoid industrial tensions. The all-pervasive social irresponsibility in the field of industrial relations is the root cause of the impasse which led to this ordinance. But such a drastic measure could at best be a palliative. Trade unions themselves should suggest new norms of industrial behaviour which would keep the government out of collective bargaining. If the trade unions do not show a new sense of social responsibility, they will make themselves increasingly irrelevant to the evolution of a just society in India.

Another point that will naturally strike the public mind in this context is the absence of cabinet rank ministers exclusively devoted to the task of promoting industrial development as also of labour. The possibility that the present predicament could have been avoided to a great extent if timely and proper attention had been given to the matter at the highest political level cannot be dismissed altogether. If the Government has found the situation so grave as to be compelled to arm itself with extraordinary powers to deal with the same, is it unreasonable to expect that there ought to be a minister of cabinet rank to deal with the subject of industrial development and a separate minister for labour which is tagged to some other economic ministry?

Ottawa summit or Reagan summit?

THE recent Ottawa summit of seven rich nations of the world—the United States, Japan, West Germany, France, Britain, Canada and Italy—failed to reach even a superficial understanding about common economic policies of the Atlantic Alliance. Despite the host country Canada's efforts to evolve a minimum consensus, leaders of non-communist industrialised countries left Ottawa without giving any quarter to their colleagues' differing views. Two major developments have taken place since the last year's Venice summit meeting—the election of the ultra-conservative Ronald Reagan as the President of the United States and the victory of the Socialist leader, Francois Mitterrand, as President in France whose ideas have emerged as an alternative to anti-Third World Reaganism.

America's partners were worried about three problems: (a) High interest rates in the United States which led to interest rate war which, in turn, led to recessionary conditions and mass unemployment in Europe. (b) America's aggressive attitude towards the Soviet Union. This has started again a cold war which has frightened the Europeans. (c) Total unconcern of Americans about the plight of the Third World which France and Canada thought was short-sighted and not in the ultimate interests of the rich world.

President Reagan has set before himself the paramount aim of fighting inflation through monetary measures. That is why he has raised the interest rates to such dizzy heights that the prime lending rates in the country are 20½ per cent. The inflation rate in the United States is about 10 per cent, but the Reagan Administration refuses to bring down the interest rates. This has affected European economies which are financially integrated with the United States. European leaders complained at Ottawa about the impact of US interest rates on their economies. Mr Mitterrand warned that as a result of high interest rates in the United States, France had to raise the prime lending rate above 20 per cent and Italy to 23 per cent. This has created recessionary conditions and more unemployment. The American policy of interest rates would bring on new social unrest, Mr Mitterrand warned. Mr Reagan promised that by the end of the year the United States interest rates may slightly be brought down. But Europeans feel that when their own interests are concerned, Americans just do not care for the economies of their partners. The exasperation of Europeans was expressed by Mr Gaston Thorn, President of the European Common Market, who turned to the US Treasury Secretary, Mr Donald Reagan, and observed: "Hurry it up, will you; we cannot wait too long". Only Mrs Margaret Thatcher who has created a record unemployment in England by pursuing the Reaganite monetary policy kept quiet but Mrs Thatcher is discredited by economic chaos in the United Kingdom.

The final comunique of the Ottawa summit declared that they were fighting both inflation and unemployment at the same time. This was a hoax. You cannot fight inflation and unemployment at the same time. What happened was that the views of both Americans and Europeans were accommodated in this meaningless statement.

The Europeans were also quite upset about the US posture towards the Soviet Union. The US wanted to adopt a hard line towards the Soviet Union. The West German Chancellor, Herr Schmidt, appealed to the United States to start a dialogue at all levels with the Soviet Union. As regards European trade with the Soviet Union, Mr Reagan pointed out that the US policy had changed fundamentally with his election. Herr Schmidt retorted that it was not possible to change the direction of a convoy just because the captain of one ship had been replaced.

The same difference of approach was visible in regard to the Third World. Mr Reagan is uncompromisingly anti-Third World. He was unashamedly for the rich, both in the United States and abroad. Mr Mitterrand, who wants to open a dialogue with the Third World, could not make any headway because Americans do not want any meaningful North-South dialogue. They have no desire to transfer real resources from the rich to the poor world. So in every sense the Ottawa summit was not the summit of industrial countries of the western world, but the Reagan summit. The reactionary economic policies of Reagan prevailed. Europeans protested, but they are so dependent on the Americans that they could not make their protest effective.

Floods: A hardy annual

THOUGH the south-west monsoon is not yet half way through, floods have been reported from various parts of the country, particularly the northern and eastern regions. During the current monsoon floods are reported to have caused heavy damage in Assam, Bihar, Uttar Pradesh and Rajasthan. To a smaller extent Kerala, West Bengal, Madhya Pradesh, Gujarat and Jammu & Kashmir have also been affected. The floods have so far taken a toll of 367 lives and affected a population of 79 lakhs spread over 7366 villages in 50 districts. The loss to property and crops is estimated at about Rs 5 crores. There have also been heavy loss of cattlehead. Before the fury of the earlier floods had abated in Rajasthan fresh floods have been reported in Uttar Pradesh and Assam.

A brief review of the statewise position reveals that there have been 150 deaths in Rajasthan, 143 in Uttar Pradesh, 50 in Gujarat, 13 in Bihar and 11 in Assam as a result of the floods. The population affected has been the largest in Uttar Pradesh, *viz* 50 lakhs spread over 5,600 villages in 20 districts. In Bihar 23 lakhs people in eight districts have been affected by the floods. In Assam, the floods have hit three lakh people in 1,000 villages in eight districts. In Gujarat, 40,000 people in 116 villages in six districts have been affected by floods while 2.5 lakhs people in 650 villages in eight districts have been hit in Rajasthan. Six villages in Rajasthan including Hingonia (Tonk district) and one village, Barbe (Katihar district), in Bihar have been completely washed away by the floods. Standing crops in one lakh hectares in Bihar have been damaged by the floods.

Floods have become a hardy annual. Some state or the other always becomes the victim of floods. In fact the losses wrought by floods have assumed serious proportions over the years. The damage due to floods amounted to Rs 3,128 crores between 1974-78 as against Rs 3,104 crores between 1954-1974. Thus on an average during recent years floods result in a loss of nearly Rs 800 crores as against Rs 150 crores a year until the early seventies. Last year floods had caused a damage of about Rs 600 crores. It is essential to undertake a long-term programme for flood control as recommended by the *Rashtriya Barh Ayog* (1976) in its report submitted in March 1980, while adopting the much needed short-term measures. The Sixth Plan has provided for an outlay of Rs 1,045 crores, including Rs 175 crores in the Central sector, for reasonable flood control measures over four million hectares out of a flood prone area of 40 million hectares in the country. According to the Plan document, only 32 million hectares of the 40 million hectares are protectable, while till March 1980 an area of 11.15 million hectares was protected. The Annual Plan for 1981-82 provides for an outlay of Rs 178 crores for flood control measures as against an expenditure of Rs 395 crores last year.

It would appear that the implementation of the *Rashtriya Barh Ayog's* recommendations will take a long time, as the State Governments' views on the report are yet to be received and processed. The states have to bear the major responsibility for implementing the flood control programme as it is a state subject. Flood forecasting and preparation of master plans should receive priority in the scheme of operations. Flood mapping from space through satellites may also be resorted to. What is required is better co-ordination between the Centre and the states and monitoring of the programmes. Also there should be no let up in the flood control measures after the monsoon is over, as unfortunately has proved to be the case.

LETTER FROM SRI LANKA

End of "statelessness" for Indians

DALTON DE SILVA

COLOMBO

THE Sri Lankan Parliament recently adopted a legislation aimed at expediting the process of granting Sri Lankan citizenship to "stateless" persons of Indian origin in the country. The legislation, in the form of an amendment to the Act governing the implementation of the agreement between Sri Lanka and India regarding the status and future of persons of Indian origin in this country, provides for the grant of Sri Lanka citizenship in proportion to the number of persons registered as Indian citizens and not to the number repatriated as hitherto. It will have the effect of ending quickly the category of "stateless" persons of Indian origin in the island.

The people of Indian origin concerned are the descendants of labour brought to Sri Lanka from South India by the British about 100 years ago to work on the tea and rubber plantations they were opening here. Their number had swelled to nearly one million people about the middle of this century. The presence of such a large number of people of Indian origin concentrated in the Island's plantations in the hill country presented a serious economic and political problem. Soon after Sri Lanka gained independence from Britain in 1948 these people lost their civic rights, including the right to vote, and five years later they were deemed to be "stateless".

The presence of these people in Sri Lanka gave rise to an issue which came to be called the "Indo-Ceylon problem". The problem strained relations between the two neighbouring countries and defied solution for many years.

A breakthrough was, however, made by the then Prime Ministers, Mr Lal Bahadur Shastri of India and Mrs Sirimavo Bandaranaike of Sri Lanka, during their discussions in New Delhi in October 1964. They signed an agreement under which India accepted the repatriation and granting of Indian citizenship to 525,000 and Sri Lanka agreed to give citizenship to 300,000 together with their natural increase. Sri Lanka was to grant citizenship to four persons for every seven repatriated to India phased over a period of 15 years. At that time Sri Lanka had estimated that there were 975,000 "stateless" people of Indian origin in the country. The two Prime Ministers agreed to consider the fate of the balance of 150,000 at a later date.

Mrs Bandaranaike's Government was defeated at the general elections a few months later and the United National Party (UNP) Government which succeeded it passed legislation in 1967 to implement the agreement. The UNP Government, however, made a change linking the grant of Sri Lanka citizenship to the registration of persons for Indian citizenship by the Indian High Commission in Colombo and not to repatriation. This was to have the effect of granting Sri Lanka citizenship faster as the registration of persons for Indian citizenship by the High Commission came before repatriation which took place many months later.

When Mrs Bandaranaike returned to power at the next general election in 1970 she reverted to the procedure of giving Sri Lanka citizenship to four people for every seven repatriated.

Mrs Bandaranaike also held discussions in January 1974 in New Delhi with the Indian Prime Minister, Mrs Indira Gandhi, on the status and future of the remaining 150,000 "stateless" persons. The two Prime Ministers agreed to divide the number equally and 75,000 were to be repatriated to India and 75,000 were to be given Sri Lanka citizenship after the 825,000 covered under the first agreement were disposed of.

Although the 15-year period stipulated in the 1964 agreement expired last year, only 271,000 had been repatriated to India and 155,000 had been granted Sri Lanka citizenship up to the end of March this year. This meant that a large number of persons still remained "stateless". The position caused concern on both sides of the Palk Strait.

The implementation of the agreement had been retarded by administrative delays particularly in giving the repatriates their provident fund and gratuity monies due to them from their employment in the plantations. Under the agreement a family was allowed to take with them to India assets up to the value of Rs 4,000.

While promising to streamline the administrative procedures, Prime Minister Ranasinghe Premadasa moved in Parliament recently an amending bill designed to revert to the original legislation of 1967 linking the grant of Sri Lanka citizenship to the registration of persons for Indian citizenship and not to repatriation.

The Prime Minister told Parliament that in implementating the agreement the amendment would be advantageous for two main reasons: (a) The objective of the agreement is to resolve the problem of "statelessness" by the grant of citizenship. Once a person is granted Indian citizenship he can be repatriated to India at a time decided by the Sri Lanka Government. (b) There is always a time lag between the grant of Indian citizenship and the time of repatriation. The pace of granting Sri Lanka citizenships would, therefore, be expedited if it is related to the number granted Indian citizenship without waiting for repatriation.

The Prime Minister disclosed that there are 84,510 persons who have been granted Indian citizenship and who are awaiting repatriation. "As the law stands at present", he said, "we have to wait till these persons leave for India to grant Sri Lanka citizenship to a certain number". He said that once the amending legislation was passed, Sri Lanka citizenship could be granted straightway to 48,291 persons, constituting four-seventh of the number granted Indian citizenship and now awaiting repatriation.

Parliament adopted the amendment with 51 voting for and 5 against.

The passage of the amendment was a major triumph for Mr S. Thondaman, president of the Ceylon Workers' Congress, the trade union which represents the vast majority of plantation workers of Indian origin in Sri Lanka. Mr Thondaman, himself of Indian origin and the Minister of Rural Industrial Development, had been largely instrumental in getting the Government to move the amendment in a bid to end the phenomenon of "statelessness" expeditiously.

EDITOR'S NOTEBOOK

Vadilal Dagli

THERE has been a feeling that co-operatives are more socially responsible than the private sector companies. Co-operatives were considered slightly less sacred than public sector plants and in terms of preference, first the public sector, then the co-operatives and then the private sector. But the recent experience of co-operative sugar factories has conclusively proved that co-operatives are as socially irresponsible as any form of economic organisation. In fact, they are hand in glove with private sector sugar companies in extracting the highest possible price from consumer and in exploiting sugar scarcities. Unlike the private sector companies, they are using their political clout in furthering their profiteering motives. In the past the country has seen the incredible picture of joint delegations of co-operatives and private sector companies pleading with the Government for a sugar policy which was decidedly anti-consumer.

So I was not surprised that the Maharashtra State Co-operative Sugar Factories Association recently demanded that the export ban on sugar be lifted with effect from November 15. Why does the Association want export of sugar at a time when sugar prices still rule around Rs 6.50 per kilo which is more than double the price of sugar only two years ago? Normally sugar prices in India were lower than the world sugar prices. But now Indian sugar prices are much higher than the London sugar prices. On July 21 sugar was available at Rs 623 per quintal in Bombay while its price was Rs 383 per quintal in London, the difference being as much as Rs 240 per quintal. If sugar is available at less than Rs 4 per kilo in London why should the Indian consumer pay Rs 6.50 per kilo. If the ultimate aim of the economy is the consumer and not the sugar co-operatives' federation, the sensible thing would be to import sugar rather than export it. So I am glad that the Government is importing about two lakh tonnes of sugar. The main argument of the co-operatives is that the production in 1981-82 is expected to touch 6.8 million tonnes mark. In this situation sugar prices may go down in the next sugar season. What is wrong if the sugar prices go down in India at least to the world price level?

It is not accidental that the sugar co-operatives have started bribing the Government by donating huge amounts to Indira Pratibha Pratishthan. Their association at the recent annual general meeting presented the Chief Minister Mr A. R. Antulay, a cheque for Rs 1.82 crores for the Pratishthan. Earlier the Shetkari Sahakari Sakhar Karkhana, Sangli, alone donated Rs 21.27 lakhs to Mr Antulay. Similarly three relatively small co-operatives have given Rs 12 lakhs to this foundation. Bombay TV dutifully covered this function of handing over the speed money which was euphemistically called donation. If they give lakhs of rupees to Mr Antulay and the foundations of the ruling party, the money will certainly be recovered from the sale of sugar made to you and me. Statistically the situation of sugar seems to be comfortable. At the end of June 1981 the country had a stock of 21 lakh tonnes of sugar as against only 15.7 lakh tonnes a year ago. The Government has asked the industry to divert free sale sugar quota for public distribution system, but the industry is dragging its feet. As long as the Government goes on obliging the sugar industry by releasing sugar in such a manner that prices remain high, the sugar industry would never realise that its prosperity and even profiteering is entirely dependent on government policy.

★

ALL modern governments are faced with the problem of increase in government spendings. Government spending leads to increase in inflationary pressures and inflation again increases government expenditure. This cycle goes on from the richest country like the United States to a poor country like India. Recently the Government of Sri Lanka decided to impose yet another cut in government's spendings so that the budgeted deficit is reduced. They have also made reduction in capital expenditure, and ministries have been asked to limit their expenditure to 90 per cent of the voted funds. In other words, a cut of 10 per cent. Thus the Government of Sri Lanka has evolved two guidelines in the determination of priorities in the public spendings: (i) quick return on capital spent; and, (ii) employment generation. In other words, merely increase in projects with long gestation periods would have low priority insofar as the government expenditure is concerned. While real GNP in Sri Lanka grew by 6.2 per cent in 1979, money supply increased by as much as 29 per cent in that year. In 1980, the growth rate was 5.5 per cent, but money supply was 20 per cent. As a result, in 1979 prices went up by 11 per cent and in 1980 by more than 26 per cent. In the current calendar year also the gap between growth and money supply has been widening still more rapidly.

★

WEIGHT reduction drugs are a multi-billion dollar business in the West. But it seems that to take drugs to reduce weight is waste of money. A recent study carried out by the University of Pennsylvania in the United States has established that weight reducing drugs are a far less effective method to lose weight than the change of the style of life through proper dieting and exercise. One group of persons—mostly women—was given a common drug of weight reduction—'fenfluramine hydrochloride' (which is sold under the brand name of Pondimin). What was the result? The study says: "They got used to having the drugs act for them, and they relied on it very heavily....so when they stopped using it they went back to old habits". Those who took drugs lost weight, but they gained back the weight during the next year. But those who took no drugs at all but changed their lifestyle by taking proper diet and doing regular exercise lost weight and did not become over-weight again. The study has concluded that weight reducing drugs are as good as useless while changing habits covering diet and exercise was more rewarding.

★

ON the eve of the marriage of Prince Charles with Lady Diana the London *Times* has published a small delightful letter from one Major Ralph Rochester which throws light on female psychology. Here is the letter:

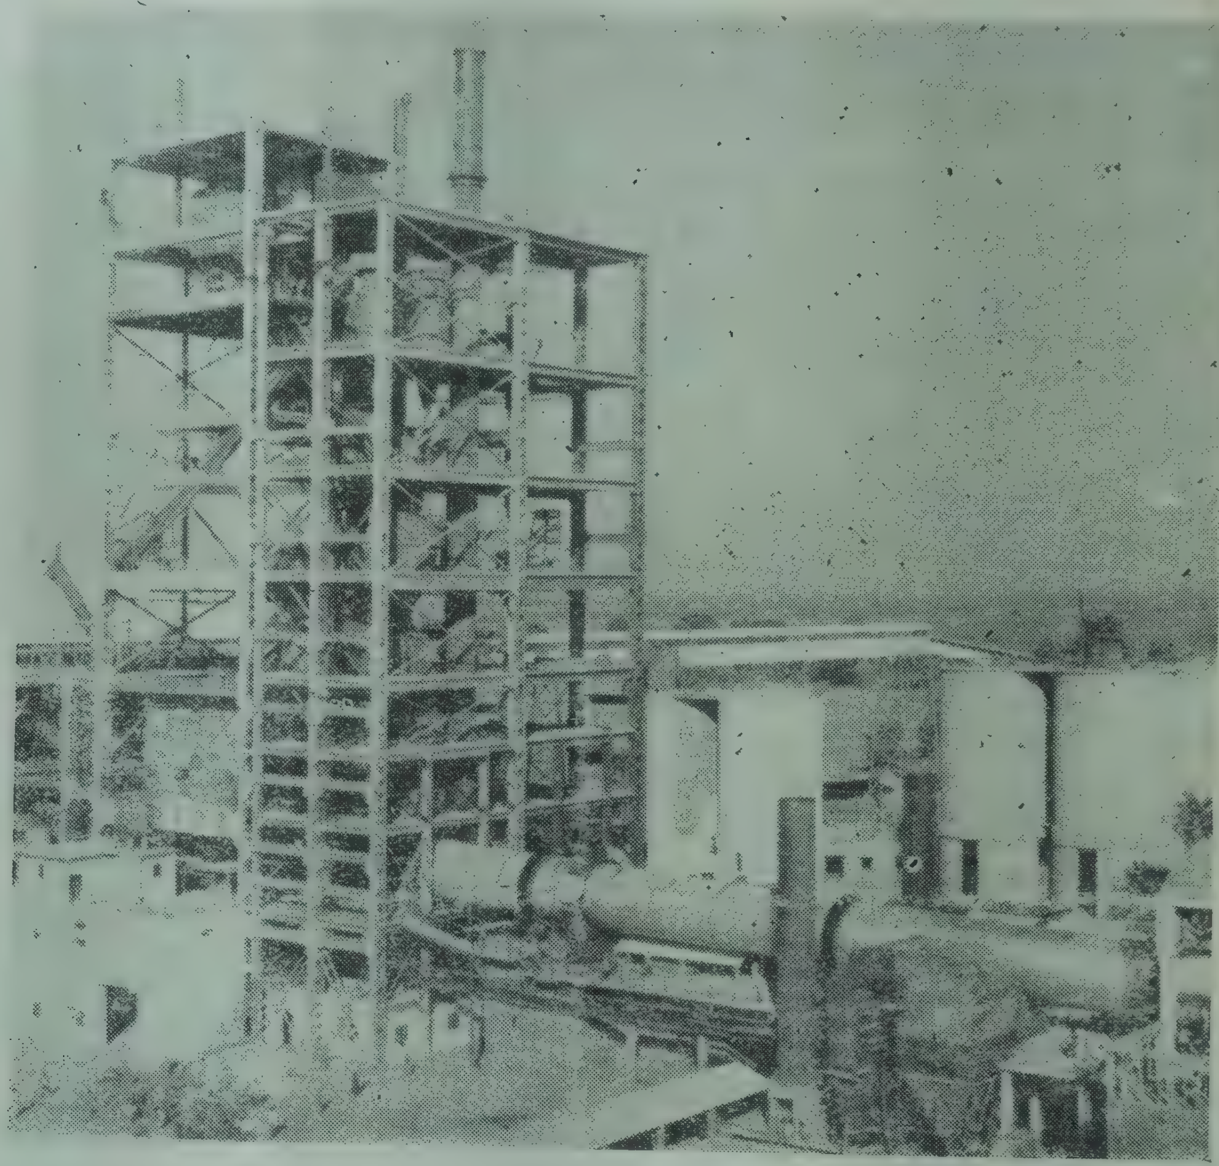
Sir: I have observed of late numerous girls who are taking pains to look like Lady Diana; but, of the boys I have observed, none is making the least effort to look like the Prince of Wales, How should this be?

Yours faithfully,
Ralph Rochester.

SPECIAL ARTICLES

A SHOT IN THE ARM FOR CEMENT

By D. B. Mahatme



A general view of the ACC's Chanda Cement Works in Maharashtra with preheater tower on the left.

THE cement industry, it is estimated, made a capital investment of Rs 175 crores, at the rate of Rs 650 per installed tonne, to increase its capacity by 2.7 million tonnes between 1978 and 1980 to 24.35 million tonnes. But its production dropped from 19.56 million tonnes in 1978 to 17.75 million tonnes in 1980 and the country has still to reap the benefit of this huge investment. Shortage of coal and power and transport bottleneck were among the infrastructural difficulties the industry had to face, as a result of which capacity utilisation dropped from 90.2 per cent in 1978 to 72.9 per cent in 1980 (See Table 1). Obviously also unremunerative retention prices had very much to do with the poor performance of the industry and, while the black market in cement has continued to flourish, some of the cement manufacturing units this year had run into cash losses.

Last week's hike in retention prices for the cement units, has, therefore, come as a shot in the arm for the industry. The increase is of the order of Rs 34.74 per tonne compared to the measly Rs 13.65 per tonne in 1980 against the demand of Rs 28.54 of the industry. This year too the industry had worked out on the basis of the formula laid down in 1978 by the Lavraj Committee that the escalation in cost till May 1981 was Rs 42.14 and the increase in the retention prices by Rs 34.74 does not, therefore compensate the industry fully. But at least the Government has made the higher retention prices operative retroactively from May 3, 1981, and this should enable a company like ACC with a monthly production of five lakh tonnes to close the year in July with a better financial picture than would have been the case with the company running into cash losses.

The Lavraj Committee had recommended in 1978 three-tier retention prices of Rs 185. Rs 205 and Rs 220 per tonne for the existing units and Rs 296 for new units and substantial expansion. Thus, with the two increases of Rs 13.65 in 1980 and Rs 34.74 last week, the new retention prices will be Rs 233.39, Rs 253.39, Rs 268.39 and Rs 344.39 for new units and substantial expansion. The industry is not all happy at the new retention prices but it is not also unhappy. Actually, the Cement Manufacturers' Association has pointed out that there has been an escalation in cost in June and July by Rs 5 a tonne, and cement producers are likely to make a representation to the Government to make good this escalation in cost, as also the shortfall of Rs 7.40, being the difference between the increase in retention price which had been demanded by the industry and the increase of Rs 34.74 granted by the Government.

Power tariffs in such states as Andhra Pradesh, Madhya Pradesh and Bihar have gone up and the Lavraj Committee had recommended that in the event of an increase in the prices of coal, as increase in the freight on coal and hikes in power tariffs, neutralisation of such cost should be provided in the retention prices. The Energy Minister, Mr

Source : Cement Manufacturers Association

A.B.A. Ghani Khan Choudhury, has hinted that an increase in coal prices was under consideration which, if it comes about, should entitle the cement industry to an increase in retention price. Whether the Government will act promptly or pursue the policy of only annual increases while the Lavraj Committee had recommended six-monthly, if not quarterly, adjustments in prices is to be seen. The Government as well may decide to wait for the report of the Cement Development and Price Review Committee, headed by Dr A. K. Ghosh, which is expected to submit its recommendations by the end of this year. In any case the new retention prices announced last week are to be operative till May 3, 1982.

In announcing the increase in retention prices the Government has raised the consumer price by Rs 81.91 per tonne or Rs 4.10 per bag of 50 kg. It will look on paper that cement has been made costlier for the consumer. But this may not be actually the case. The blackmarket has been flourishing in cement and the ordinary consumer has already been paying Rs 100 to Rs 110 per bag of which the controlled price was till recently Rs 30. Politicians and bureaucrats, with the state governments in-charge of distribution of cement, have helped the blackmarket to grow. Some of the cement factories have also exploited the situation. A mere suggestion by these factories that the permit-holders will have to wait in a queue of which the duration was unspecified has made the anxious party concerned to pay some on-money. It is, however, the corrupt official machinery which has exploited the shortage situation most. Official assessments are that there is a shortage of about eight to nine million tonnes and the industry has been going along with this assessment. But imports are of only two million tonnes a year and it is doubtful whether the shortage is as big as is tried to be made out.

The increase in the price of cement, of course, means that the government projects will be costlier. The Government is the largest consumer of cement and purchases 50 per cent of the total production of the industry. If the higher prices lead to some economy in the use of cement in the government projects, they will have served a good purpose. As it is, it is known that there is a wastage of cement in government projects whether for housing, irrigation, electricity or public sector undertakings. Some even allege that part of the cement quota earmarked for government projects finds it way in the blackmarket.

Cement is a basic commodity of which the growth has not been adequate because of the industry being subjected to rigid price controls almost continuously since 1942. That the low retention prices have proved a damper to the growth of the industry can be seen from the fact that in not a single plan period the targets—whether in regard to production or capacity—were achieved. In the First Plan the shortfall was nominal, but the gap widened in the subsequent years (See table 2). It is presumably because of this the Government has already approved adequate additional capacity of the order of 33 million tonnes.

The Sixth Plan proposes to increase the cement capacity to 43 million tonnes and a production target of 34.5 million tonnes for 1984-85 is envisaged. On the basis of a statement in Parliament by the Union Minister of State for Industry, Dr Charanjit Chanana, that the demand estimate for 1980-81 was just short of 28 million tonnes, the industry has calculated that the demand would rise to 38 million tonnes by 1984-85 even on a growth rate of eight per cent per annum. It has also worked out that the capacity required at 80 per cent utilisation will be 48 million tonnes and 85 per cent utilisation 45 million tonnes to meet this demand. The current annual capacity this year was about 26 million tonnes and this would mean that if the country were to become self-sufficient by 1984-85, an additional capacity of the order of 20 to 22 million tonnes has to be created. The capital costs have now risen to at least Rs 800 per tonne and on this basis the industry will have to make a massive investment of Rs 1,600/Rs 1,760 crores. Will this investment be forthcoming if the Government does not bring to bear a pragmatic outlook on the cement pricing policy ? The investment will be quite massive even if the official targets in the Sixth Plan are taken into account. The necessary investment environment must be created by the Government for imports are costly and we have to pay two to three times the price that the domestic producers receive.

It is a healthy sign that the Sixth Plan recognises that lack of adequate infrastructural facilities like coal, power and transport have led to the underutilisation of capacity in the cement industry during the recent years. The percentage of coal received by the cement units was 79.5 per cent of the linkage of nearly 64 lakh tonnes in 1978, 67.5 per cent of nearly 72 lakh tonnes in 1979 and as low as 53 per cent of the linkage of nearly 75 lakh tonnes in 1980. The position had not improved during the current year and the coal supplies were only 61 per cent of the demand during the first five months of the current year.

Power shortage too affects the cement industry. The announcement last week, simultaneously with that of an increase in retention prices, that the Government had also decided to extend the scope of the scheme of subsidy for generation of power for captive power plants set up by cement plants after October 1978 must be welcomed. Strangely enough when the Government decided on a captive power subsidy of 31 paise per kwh for diesel power and five paise per kwh for thermal power in 1978, it said the benefit would accrue to only captive generators existing as of the date of announcement of concession. This has discouraged cement units from going in for captive power even in the days of power shortage. Reportedly four or five cement units generate their own power. But now that the subsidy will be extended to captive generating sets installed even after October 1978, it is expected that at least 15 to 20 companies more will go in for such a programme.

But even if the problems of coal and power availability and transport are solved the critical element in the growth of the industry will continue to be an adequate price. This question is being examined, as stated earlier, by the Ghosh Committee and the cement industry has made its own submissions before the committee. Reportedly it has suggested that fair retention prices should be worked out on the basis of 80 per cent capacity utilisation and not 85 per cent as it is implicit in the Lavraj Committee report. Further, retention price escalations should be granted on a quarterly basis. It has also suggested the setting up of Cement Industry Development Fund to help finance modernisation and expansion of the industry. The Ghosh Committee is expected to recommend whether the three-tier pricing system should continue or it should be substituted by a new one. Also, in the context of increasing capital costs and the ambitious target that the Sixth Plan has set in the creation of cement capacity, it will presumably examine whether new incentives in the form of higher retention prices or subsidies or concessions should be extended to the industry. Originally the committee was expected to submit its report by September-end but the time has now been extended to December-end, and Dr Ghosh is known to be very keen on sticking to this time schedule.

But should the industry be under rigid price control as it has been for the last forty years? Within the industry itself there is a division of opinion. But the recent enlargement of the terms of the L. K. Jha panel on Economic Reforms has given the industry some hopes that it can be at least free partially from the controls. The Jha panel has been asked to go into the question of liberalisation of controls and the industry is preparing its case to be placed before Mr Jha.

At a recent meeting in Madras, the managing committee of the Cement Manufacturers' Association was reported to have considered two alternative approaches—the first one being dual pricing and the second partial decontrol. Under the first scheme the Government would get the cement at controlled price and 50 per cent of the output would be sold to the public at a price of Rs 200 per tonne higher than the price at which it is sold to the Government. This scheme involves the creation of so to say a development and modernisation fund. It proposes that out of extra Rs 10 per bag recovered from the public, Rs 5 should be funded in a joint account of the cement unit concerned and the Government, an account from which money can be drawn only when required for modernisation and development. The balance of Rs 5 will, it is expected, enable the cement unit to meet the escalation costs.

The other scheme involves partial decontrol. It would sell the cement required by the Government at a fixed price but leave free the cement industry as to the price to be recovered from the other consumers. It will give a good-bye to the freight equalisation pool. But the ACC and cement units in southern India would seem to prefer the dual pricing scheme under which the freight pool will continue to operate. Under the pool scheme cement units receive payment from the Cement Regulation Account or have to reimburse the Account depending on whether the freight involved is higher or lower than the average freight taken into account by the Cement Controller. Not surprisingly the southern units do not want to see the operation of the pool disturbed and if the Jha panel has to make a choice between the two it is likely to favour the dual pricing scheme under which the freight pool will continue to operate and the consumer is also assured of cement at a fixed price. It is not likely that the Government in view of the assessed shortage of cement will rely on the cement industry to be fair to the consumer. Of course, the consumer under the present distribution arrangements, which are controlled by the state governments, is not also treated fairly but that is a different question. Under the dual pricing scheme, distribution of cement will not be left with the state governments but with the stockists of cement manufacturers, as before 1977, on the basis of permits issued by the authorities. The industry believes that even if the consumer has to pay a blackmarket price in some instances, it will not be as high as he is doing today with distribution left in the hands of the state governments.

Teble 2: Growth and development of the cement industry during the first four Five Year Plans and each year of the Fifth Plan

* The Fifth Plan was in force only for four years as it was terminated by the financial year ended 31st March, 1978.

Priority allotment of cement against foreign exchange

By BHANU SANGHVI

EVEN in these days of dire shortage and rampart black marketing, one can easily get necessary quantity of cement directly from the manufacturer or his nominee at official price in a jiffy without any pull or pressure or any sort of underhand dealing. There is a government scheme for priority allotment of cement against foreign exchange remittances which is functioning very efficiently and scores of people are taking advantage of it without any difficulty.

This scheme is being handled jointly by scheduled banks operating in foreign exchange business and the concerned state governments. Following is a brief outline of the scheme :

Eligibility : The scheme is meant to provide priority allotment of cement to individuals only, for his personal residential purpose utilisation. Business houses, associations and institutions are not eligible to apply. Even joint applications of more than one person are not accepted. Any Indian national who has returned to India from abroad or relatives of an Indian residing abroad who might have received foreign exchange remittances to purchase the cement from latter can apply for priority allotment.

Time limit : Foreign exchange remittances which are more than three months old on the day of the application do not qualify for this scheme

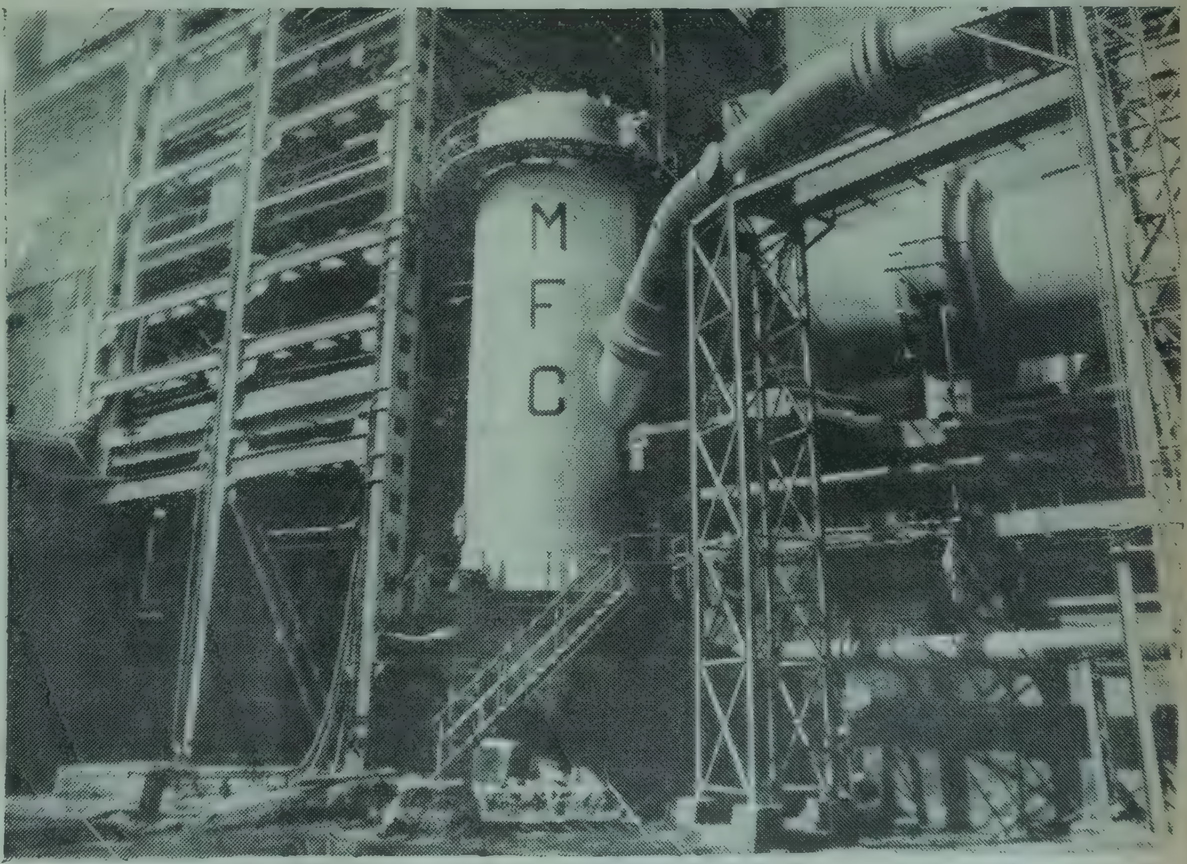
Procedure: Application forms could be obtained free of charge from any scheduled bank authorised to deal with inward remittances of foreign exchange or PRO, Food and Civil Supplies Department, Government of Maharashtra, 2nd Floor, Mantralaya (Annexe) Bombay-400 032. Those residing in Gujarat or other state can obtain such forms from Sachivalaya of their respective states. The application form is very simple and self explanatory. The applicant is required to open "a non convertible account" in his name and credit in it whatever cheque, draft, MT, TT or traveller's cheque he might have received for this purpose and submit his application for cement to the bank. The bank forwards his application to the state government with its endorsement by registered post only. The applicant will receive his allotment order also by registered post only as the government neither receives nor issues any paper in person in this connection. Usually it does not take more than 45 days for applicant to receive his allotment order.

Other details: Non-resident Indians can utilise their balance in foreign exchange external or foreign currency non-resident, (FCNR) accounts for this purpose. Where the applicants have already remitted funds for credit to their non-resident (external) accounts with their bankers and wish to apply for allotment of cement on the strength of those funds, the requisite amount under the scheme should be transferred to a separate 'non-convertible account' to be opened for this purpose. The amounts so transferred will not be eligible to be recredited to the non-resident (external) account or to be remitted abroad except where an applicant desires to cancel his application for priority allotment of cement. Prior permission of the Reserve Bank of India will be necessary for such retransfer.

There are no minimum/maximum limits for allocation. One may apply for as much as quantity as required but all the applications for more than 20 tonnes (400 bags) have to be accompanied by a certificate of a registered architect or engineer, justifying the quantity applied for.

One must bring in foreign exchange at the rate of Rs 700 per tonne of cement applied for. However, only actual prevailing price has to be paid from the account to the supplier and balance amount, if any, could be utilised to make any other local payments.

Mr Sanghvi is an assistant editor in the Gujarati bi-weekly, VYAPAR.



Precalcinator technology developed by Mitsubishi Mining & Cement Co Ltd, Japan, was adopted for the first time in the world at ACC's Wadi Cement Works in Karnataka. This technology results in higher output with the same quantity of fuel introduced at the kiln firing end. Picture shows the MFC precalcinator vessel on one of the kilns at Wadi.

On estimating the household sector savings in currency and deposits

By A. VASUDEVAN

ONE of the aspects of the data of savings of the household sector which has not received due attention relates to savings in the form of currency and bank deposits. In view of the reported formation of a committee on savings and investment, it is essential to have a thorough look at the data of savings, especially of savings in the form of currency and deposits by the households, both from the analytical and statistical angles.

In the household sector's savings, which formed about 77 per cent of the total net domestic savings in the 'seventies, net financial savings accounted for more than 35 per cent. Financial savings are given in *net* terms, by reducing financial liabilities from the financial assets held by the households. The financial assets are : currency, deposits, life insurance fund, provident funds, shares, bonds, debentures of corporate and cooperative sectors, units of the UTI, small savings, loans to companies, securities of term lending institutions and other assets. Among these, the most important are currency and deposits, as they accounted for 62.2 per cent of financial assets of the households on the average during the period 1971-72 to 1979-80. Table 1 gives details in this regard.

The table shows that the average share of deposits during the period in the financial assets held by the sector was about 48 per cent while that of currency was 14 per cent. The proportion of currency and deposits in financial assets was high at 73.3 per cent in 1976-77 and low at 49.1 per cent in 1974-75. The amplitude between the high and the low shares thus was 24.2 percentage points.

It may be asked as to why in a short period of nine years, the amplitude was so high. Does this suggest that the savings behaviour in respect of certain assets changes drastically year to year ? Or, is it something of a statistical derivation? No theory as yet gives any clue as to why savings propensities change in the short run. All that the theory suggests is that the savings behaviour would not show wide fluctuations over time and that it is essentially a function (positive) of income (obviously nominal). But in so far as currency and deposits dominate as forms of savings in total gross financial assets, it is essential to know as to why households *demand* currency and deposits to such an extent, merely to place them under their savings. Implicitly, what is so demanded of currency and deposits is *supplied* by the monetary authorities and the commercial and cooperative banks. In other words, savings in financial assets are, to a considerable extent, dependent upon the supply of currency and deposits *i.e.*, 'broad' money (defined here currency with the public and aggregate bank deposits).

It is interesting to compare the actual increases in currency with the public and in aggregate bank deposits with the savings in the form of currency and deposits for the 'seventies. This comparison, made in Table 2, shows that currency and deposit savings were higher whenever there was an increase in 'broad' money. Currency savings, in particular, were highly positively corelated with the incremental currency with the public, 'r' being 0.9978, and statistically significant. Savings in deposits and increases in deposits too were positively correlated, with the value of 'r' being lower at 0.9683, but statistically significant.

Given these statistical facts, one is left to wonder whether savings in currency and deposits do not automatically follow, by the given linking factor—the 'beta' coefficient or the slope in the regression equation—once there is a certain variation in 'broad' money. Is this a mere statistical derivative or are there any 'behavioural' elements in the propensities to save in currency and de-

posits? Apparently, it looks that the behavioural aspect is not present, and the data of currency and deposits savings are essentially statistical derivations. This may be proved by referring to what is presumed to be the method of estimation of savings in these two forms of assets.

First the currency savings. From the outstanding currency with the public as on March 31, is deducted the cash balances held by the Government and corporate sector in order to arrive at what may be loosely termed as the currency held by the household sector. This procedure is carried out for each year. The difference in the currency with the household sector for any two years is deemed to be saving in currency for the later of the two years. On the average 95 per cent of increase in currency with the public is reported to be savings in currency between 1971-72 and 1979-80.

In respect of deposits, the survey of ownership of deposits of the Reserve Bank of India throws light on the proportions of deposits held by different sectors. Applying these proportions, one can arrive at the sums of deposits held by different sectors. It appears that the sums of deposits held by all those sectors which do not constitute the household sector are first worked out, and reduced from the aggregate deposits, so as to obtain what may be regarded as the deposits held by the household sector. The difference in the deposits of the household sector for any two years gives the savings in the form of deposits for the later of the two years in question. Over the nine year period, 85 per cent of the rise in deposits constitutes the household sector's savings in deposits. In the last three years, the proportion was about 78-80 per cent.

If this is what is broadly followed in estimation, it implicitly assumes that all the increased sums of currency and deposits *demanded and held* by the household sector are saved during the year and that whatever the sector has utilised as transaction (and precautionary) balance is equivalent to the outstanding currency and deposits of the sector at the time of the origin. This point may be illustrated as in Table 3.

Table 3 shows that when the sector increased its holdings of currency and deposits in period t+1, by Rs 1,000 crores, the transaction balance was the same as at period t, *i.e.* Rs 20,000 crores. When the sector reduced by Rs 500 crores its holdings of currency and deposits in period t+3, the sector's transaction balance was deemed to be the same as in period t+2. This means that transaction balances are given by the estimation method of savings rather than by any behavioural factors. This violates one of the important hypotheses in the demand for money, *viz,* the demand for transactions balances is positively correlated with nominal income or output and prices.

It is possible to improve the estimation of savings in currency and deposits by using better analytical techniques. We attempt to sketch them out in brief for purposes of illustration. As regards currency savings, it is first essential to work out the income velocity of currency held by the household (given by the ratio of national income at factor cost at current prices to the currency held by the household sector). If this velocity declines/rises, it means that the demand for currency by the household sector has gone up/declined. Trends in this velocity give an idea of the demand for currency by the households but they do not indicate as to what extent the households demand cash for speculative purposes and to what extent the cash demand is for transaction (including precautionary) purposes.

For knowing the transaction cash balances of the households, one could first relate functionally the income velocity of currency of the households to the weighted short term rates of interest (such as the call money rate and the bank rate), then derive the cash balances that households tend to hold for speculative purposes and finally reduce the speculative cash balances from the outstanding currency with the households. With regard to savings in deposits, it is essential to have an idea of the quantum that households would hold in different types of deposits. The ownership survey will give the amount of fixed deposits that households hold. The difference in the amounts of fixed deposits of households for any two years will give savings in fixed deposits by the households for the later of the two years in question. (By the same token, all the increases in the deposits with non-banking companies may be taken as savings by the household sector).

Table 3 : Outstanding currency and deposits

(Rs crores)

Period	Outstanding currency & deposits of the households	Increases/decreases in currency & deposits (saving (+) or disaving (—)	Transaction Balance in currency & deposits
	(1)	(2)	(3)
t	20,000	—	20,000
t+1	21,000	+1,000	20,000
t+2	21,500	+ 500	21,000
t+3	21,000	— 500	21,500
t+4	22,000	+1,000	21,000

In respect of current deposits debits, data, would provide an idea of current deposit velocity (the ratio of debits to current accounts to current deposits). A rise in current deposit velocity will imply a fall in the demand for current deposits. The amounts oustanding in current accounts which are not debited should be treated as the current deposit balances held by the household sector. The difference in such current deposit balances of the household sector for any two years will give savings in current deposits by households for the later of the two years considered. Here, however, the available debits data relate to 1974-75. As for savings deposits, the time liability component can be regarded as almost term deposits, held by the household sector. The difference in the time liability sums of savings deposits for any two years will give the savings in the form of savings deposits by the household sector.

Both in respect of currency and deposits, increases between March 31 of a year and March 31 of the subsequent year will contain 'shock' effects. It is best to work out averages of outstandings of currency and deposits at the end of each month for the years in order, to know the 'flow' of these two variables through the years.

The alternative method of estimation of savings of the household sector in currency and deposits suggested here would, it is hoped, give a more realistic picture of the households' savings in these two financial assets than what the present estimates show. It is possible to make improvements and to introduce refinements in our suggested method, by using additional and qualitatively better data of short term rates of interest, the size of different money markets and debits to current deposits.

Another year of steady growth for INDIAN BANK

SIGNIFICANT PERFORMANCE AREAS

- **Total Deposits up** by 18.8%—to Rs. 1164.0 crores
- **Total Advances up** by 15.4%—to Rs. 681.9 crores
- **Priority-Sector Advances up** by 20.5%—to Rs. 185 crores (32.1% of all advances)
- **Agricultural Credit up** by 30.6%—to Rs. 65.8 crores
- **Adopted Villages grew** to 1113
- **Advances to Small-Scale Industries grew** to Rs. 84.9 crores—on 30,783 accounts
- **Branch Network up** by 37—to 825
- **Total Income up** by 30.6% (Rs. 25.8 crores)

STRONGER CONCERN FOR WEAKER SECTIONS

- **Credit under 20-Point Programme up** by 29.5%—to Rs. 44.8 crores
- **Small Depositors** formed 89% of all Deposit accounts
- **Small Borrowers** formed 94% of all Credit accounts
- **Small & Marginal Farmers** received 64% of direct agricultural credit
- **Weaker Sections** helped under DRI Scheme grew to 40,482 accounts
- **Scheduled Castes/Tribes** accounted for 35% of total credit under DRI Scheme

INTERNATIONAL BANKING DISTINCTION

- **Foreign Branches' Deposits up** by 57.9%; Advances by 64.2%
- **Pioneered** Deposit Taking Company at Hong Kong, on consortium basis
- **Singapore Branch** undertook both off-shore & on-shore Banking
- **FCBU inaugurated** at Colombo
- **Continued** consultancy to PT Bank Rama, Jakarta
- **Submitted** bankable schemes Survey Report to Govt. of Sri Lanka

Extracts of BALANCE SHEET as at 31st December, 1980

as at 31 - 12 - 1979 Rs. (crores)	Capital & Liabilities	Rs. (crores)
6.00	Capital (wholly owned by Government of India)	6.00
1.27	Reserve Fund and other Reserves	1.79
980.17	Deposits and other accounts	1,164.04
44.45	Borrowings from other Banking Companies, Agents, etc.	49.94
11.70	Bills Payable	13.59
51.94	Bills for collection being Bills Receivable as per contra	64.42
12.86	Other Liabilities	18.23
59.13	Acceptances, Endorsements and other Obligations as per contra	92.93
0.21	Balance of profit (after transfer to Reserve Fund & provisions for bonus) to be transferred to Central Government	0.21
1,167.73	Total	1,411.15

as at 31 - 12 - 1979 Rs. (crores)	Property & Assets	Rs. (crores)
127.04	Cash	142.08
8.36	Balance with other Banks	5.94
12.02	Money at Call and Short Notice	6.16
269.17	Investments	358.56
591.13	Advances	681.94
51.94	Bills Receivable being Bills for collection as per contra	64.42
59.13	Constituents' Liabilities for Acceptances, Endorsements and other Obligations as per contra	92.93
2.05	Existing Premises & Buildings under construction	3.49
5.60	Furniture, Fixtures etc.	6.08
41.29	Other Assets	49.55
1,167.73	Total	1,411.15

Extracts of PROFIT & LOSS ACCOUNT for the year ended 31st December, 1980

Year ended 31-12-1979 Rs. (crores)	EXPENDITURE	Rs. (crores)
56.65	Interest paid on Deposits, Borrowings, etc.	75.24
17.50	Salaries & Allowances, Provident Fund, Gratuity, etc.	22.70
7.84	Operating and other Expenses	9.83
0.86	Depreciation on and Repairs to Bank's Property	0.95
1.64	Balance of Profit	1.60
84.49		110.32

Year ended 31-12-1979 Rs. (crores)	INCOME	Rs. (crores)
76.24	Interest and Discount	100.47
6.65	Commission, Exchange and Brokerage	8.06
0.17	Rents	0.20
0.09	Net Profit on Sale of Investments and Various Assets	0.05
1.34	Other Receipts	1.54

In My View

Where's the government?

By AJIT BHATTACHARJEA

A PUBLIC opinion poll to select the most inefficient ministers of the Government of India would come up with some intriguing results. The first problem, of course, would be that most members of the public, even in the bigger cities, may not be able to recall too readily even the names of all the members of the Union Cabinet, let alone their portfolios. Presumably, the pollster would have to take with him a list of the ministers' names and the departments of which they hold charge, with ticks to indicate whether the persons polled think they do their jobs effectively, adequately or badly. A separate box can indicate whether the minister concerned is also regarded as corrupt.

In the present Cabinet, only three ministers may pass public scrutiny as both effective and honest (whether one agreed with their policies or not) : Mrs Indira Gandhi, Mr Narasimha Rao and Mr R. Venkataraman. Over the others hangs a question mark. I doubt if any would survive if their future depended on a favourable result at the polls.

If public memory were not so short, at least two should have been forced out of office long ago. Not even a year ago, the Minister of Energy, Mr A. B. A. Ghani Khan Chaudhury, was charged specifically on the floor of the Lok Sabha with misusing his official position to persuade the authorities to issue 133 coal permits to persons not entitled to get them. Almost the entire quantity had been smuggled to Bangladesh. It was pointed out that the coal allocation had been made to Malda district in West Bengal, part of the Minister's constituency, shortly after the Lok Sabha elections.

Though present in the House, Mr Ghani Khan Chaudhury, did not deign to reply to the charges. Instead his colleague, Mr C. M. Stephen (whom we shall come to later) described the charges as "a non-issue". This was bad enough, but worse was to follow. Mr Stephen justified the issue of permits to favourites with a rhetorical question. If his colleague's friends approached him for permits, he asked, "could he keep quiet?". Another colleague, Mr P. Shivshankar demonstrated his eminent suitability as the minister in charge of Law and Justice by ruling: "If he (the minister) nurses his constituency, there is nothing wrong in it."

With such defenders, Mr Chaudhury needed no critics. They represented the prevailing ministerial standards better than he. The Railway Minister, Mr Kedar Pande, was therefore possibly fortunate that Parliament was not in session when the crowded Samastipur-Barmankhi passenger, with hundreds travelling on the roof, fell from a bridge into the turbulent, silt-laden Bagmati river on July 6. As many as 246 bodies were recovered, most of them by naval divers working in horrifying conditions, but many more were swept away. Some estimates put the toll at 2,000.

This was certainly the worst disaster in rail history. A quarter century ago, Mr Lal Bahadur Shastri, resigned the Railway portfolio, after a far smaller accident. But there was not even a squeak from Mr Pande. The chairman of the Railway Board made things worse by suggesting that the train has been blown off the bridge by a freak cyclone, even though it left no trace of its devastating passage anywhere else in the vicinity.

Last week, 41 passengers died in another train accident near Bilaspur and another 22 when the Ahmedabad-Delhi mail derailed near Mehsana. But these can hardly disturb a minister who was unmoved by the Bagmati disaster. When Parliament reassembles next month, Mr Stephen or Mr Shivshankar may well describe any charges against Mr Pande as another "non-issue". The Law Minister, if still holding the portfolio, may also see nothing wrong in trains being overcrowded in the Railway Minister's home state.

Eloquent in defending his colleagues, Mr Stephen excels in defending himself. The unfortunate telephone users in this country will never forget his suggestion in Parliament last year that they surrender their phones if dissatisfied with the service. In Delhi, particularly, many exasperated phone users would enjoy throwing the instrument at him if he dared make the offer outside.

On an average, it takes three wrong numbers to get through to the right one. Wrong numbers are not confined to local calls. STD calls to distant places suffer the same disability. After repeated attempts to dial Bombay, I once got through to London! But Mr Stephen would probably justify all this as a unique way to increase revenue by increasing inefficiency.

The minister may also not quite realise the mess the system is in. After getting three numbers, innumerable wrong connections, hearing strange sounds in the receiver and then wasting ten minutes awaiting assistance from 199, I called his own residential number. It rang, but no one picked the phone. I then called his office and got through promptly, only to be informed that the minister was still at home. On insisting that nobody seemed to be at the residence, I was told that the minister must be in transit. Perhaps he is.

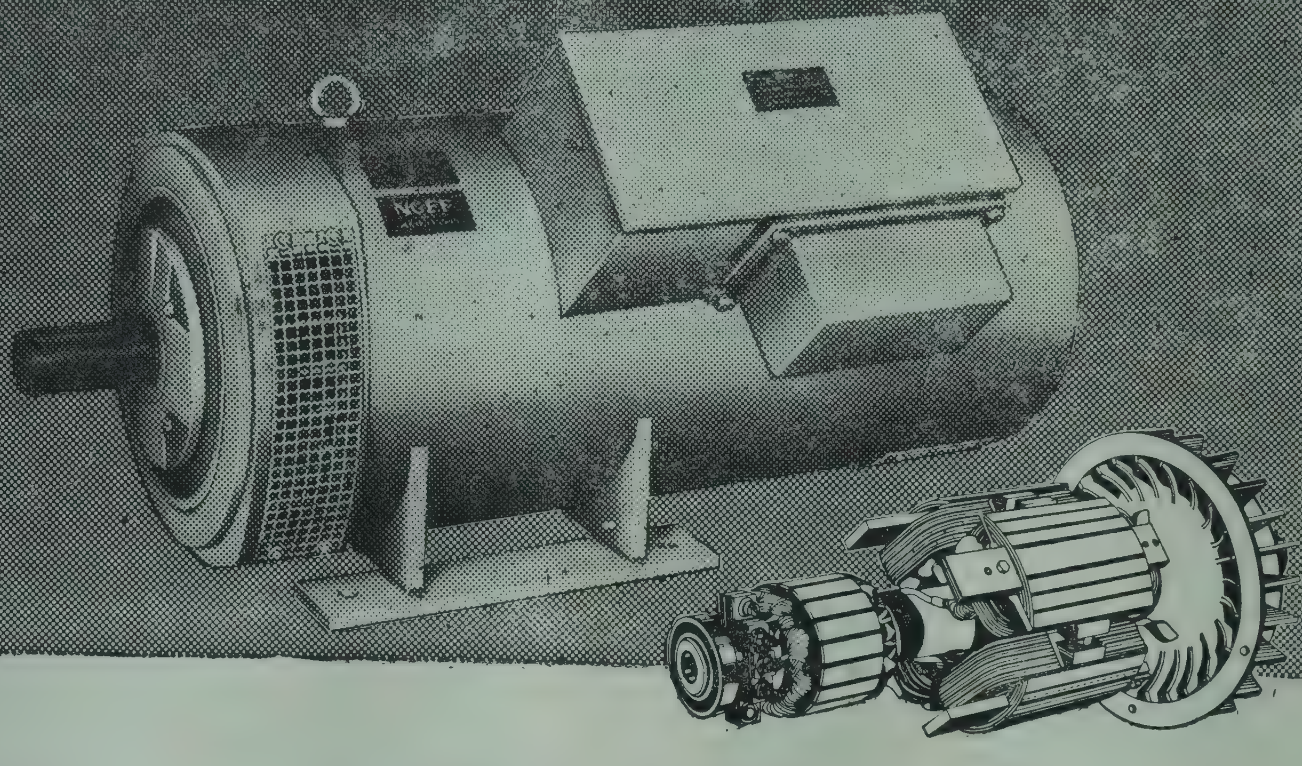
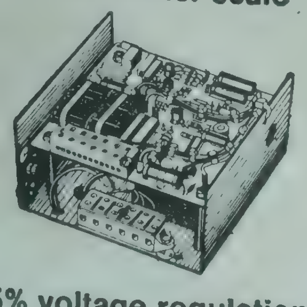
NGEF brings the latest proven, reliable technology of AEG-TELEFUNKEN in the widest range of Brushless Alternators — 8 kVA to 1150 kVA with superior Class 'F' insulation



Special highlights:

- Less maintenance due to the absence of brushes, sliprings and commutators
- No failure of insulation or risk of fire hazards due to the absence of carbon dust
- Class 'F' insulation for all electrical parts — non-hygroscopic, preventing absorption of moisture
- Compact, sturdy electronic regulator common for all outputs that can withstand shocks up to 4 g on the Richter scale



- ±0.5% voltage regulation at all loads
- Reference voltage adjustment up to ±5%
- Fast voltage build-up enabling better motor starting
- Fast transient response (No-load to Full-load — 200 to 600 milliseconds)
- Smaller size of base plate resulting from high output to weight ratio
- Ideally suited for parallel operation with the grid or other generators

In the mid-sixties NGEF introduced, for the first time in India, the latest IEC frame sizes and class 'E' insulation instead of class 'A' insulation for AC electric motors. Over the years, this technology has proved itself, with other manufacturers following suit. Now NGEF does it again, introducing the widest range of Brushless Alternators with class 'F' insulation.

NGEF Alternators conform to IS: 4722, VDE 0530 and BS 2613. NGEF also offers special types suitable for marine duty as per the specifications of Lloyds, Indian Register of Shipping, American Bureau of Shipping and others, applications requiring constant voltage to frequency ratio and machines with sinusoidal wave forms, etc.

The normal radio interference up to grade 'G' as per VDE:0875 is provided, but NGEF can also offer as per grade 'N' or 'K' for special applications.

Cheap foodgrains for urban areas

By ARVIND BHANDARI

DATELINE NEW DELHI

NOW that the fall-out of controversy over import of foodgrains is beginning to settle, it would be worthwhile to have a look at the public distribution system to sustain which the controversial decision is supposed to have been taken. In the initial stages the system had some meaning. It was introduced in the wake of the Bengal famine of 1943, and continued into the post-war and immediate post-independence period in view of the prevailing food shortage in the country. After the improvement in the food situation in 1955, when all restrictions on zonal movement of foodgrains were removed, the system could have been dismantled, but it was not. As the PL-480 grain arrived in shiploads in 1956 the existing network of fair price and ration shops came in handy to serve as a conduit for distribution and absorption of the imported grain at throwaway prices. Thus a system introduced originally to relieve genuine distress became an instrument for pampering the urban classes by providing them with cheap foodgrains. Since then, because of political considerations and despite the green revolution, the humbug continues to be perpetrated in the name of food security. It is worth reflecting whether the country can afford to provide subsidised foodgrains to four-figure and five-figure income earners who, according to various reports, have been the main beneficiaries of the public distribution system. The Government should no doubt keep an emergency buffer for unforeseen contingencies. It could with equal justification procure foodgrains for the Food-for-Work Programme in order to bring food within the reach of the millions who have no money to buy it. Perhaps there is also a case for providing subsidised foodgrains to those with an income up to, say, Rs 600. Rest of the apparatus should be dismantled. This would, roughly speaking, halve the quantity required to be procured by the Government and it could be taken in the form of a levy, either on the farmer or on the wholesaler. Lessening of governmental interference in the foodgrains market would enable determination of natural prices which, considering the improvement in production and, therefore, supplies, could be expected to be not much higher than those prevailing. Natural prices, it can hardly be gainsaid, would also give a further fillip to production. The clamour for higher and higher procurement prices, with all the noisy politics involved, would become less deafening. The burden of food subsidy on the public exchequer would become lighter. The ignominy of food imports would be avoided. The costly functioning of the white elephant called the Food Corporation of India would be suitably truncated. In a recent letter to Mr Bhanu Pratap Singh, MP, the Finance Minister said : "The FCI is being allowed a cash credit for its foodgrains transactions at a concessional rate of interest by the banks. Besides, the Government has also given dividend-free support to the Corporation of the order of Rs 250 crores as on March 31, 1981." In case the task of collecting the food levy could be entrusted to state food departments the FCI could very well be wound up. Also worth examining is the feasibility of having, as in Japan, a centrally monitored national grid of small godowns run on co-operative principles. Apart from making up the existing lacuna in warehousing facilities, this would also reduce the cost of transportation of foodgrains.

Stoking inflation

Consistency, goes the aphorism, is the hobgoblin of weak minds. Little wonder, therefore, that the Government has opted for such mental strength that one can virtually detect no method in its madness. Of the various economy-watchers I have spoken to in the last few weeks not one disagrees that the net result of the measures taken by the Government in the name of inflation would be to exacerbate inflation. Asked as to the rationale behind the hike in the prices of petroleum products, a highly-placed source in the Petroleum Ministry candidly said : "For various reasons, including failure of the bearer bonds scheme, they needed money." If it is money they needed, was it necessary to adopt a method that has stoked inflation, further squeezed the common man and slowed down the economy, if not actually caused stagflation?' Since it is being said that one of the main purposes for which the additional money is being raised is the financing of oil exploration, there is a strong opinion that a comparatively less burdensome method would have been to simply raise the Rs 1,000-odd crores in the international money market. If governmental behaviour lacks method, it betrays a surfeit of make-believe—or hypocrisy. Not a day passes when some minister or the other does not, like a modern-day Don Quixote, tilt at the black money windmill, blaming the scourge for the inflation and prescribing his own little remedy for it. But none of the ministerial sermonisers has the guts and the gumption to even indirectly admit the underlying nexus between black money and politics. Mr Morarji Desai asserted in Bhopal a few days ago : Corruption among politicians is the main factor responsible for the rising prices. They accept money from business houses and then leave them free to earn as much as they like from the common consumer." This may be too simplistic an explanation for the soaring price graph, but it does contain an element of truth, especially in a set-up that is riddled with controls. Last October there were widespread reports of a secret understanding between Gujarat groundnut oil manufacturers and the state's politicians who looked the other way when vanaspati rates were jacked up to scandalous levels. During the past few months there has been much talk of collusion between certain leaders of the ruling party and sugar magnates. Again, had it not been for active complicity between cement distributors and influential people at various levels, this commodity would not have freely sold in black market at fancy prices. Unless the Government of the day summons up the will power and tenacity of purpose to strike at the root of black money neither black money nor its contribution to inflationary fires can be lessened. This requires electoral reform, tax reform and a close examination of the system of controls. Mere tinkering with the problem short of this is akin to schoolboyish anxiety to mark attendance in a classroom.

BOOKS & IDEAS

Traditional items, the key to higher exports?

India's Export Performance—Some Policy Implications

By DR K. S. DHINDSA

Published by Intellectual Publishing House, 23 *Daryaganj, New Delhi*-110 002; *Pages* 243; *Price Rs* 70.

India has always been in the grip of tight balance of payments and, with the oil crisis, it has become really imperative that the foreign exchange reserves be in surplus so as to meet any eventuality. Needless to say this would enable India to accelerate its pace of industrialisation and economic growth. But then the foreign exchange position can be in surplus only if India is able to export more than what it imported. How best are we to increase our exports and keep down the imports to the barest minimum? This question has engaged the attention of policy makers and administrators for quite sometime. Quite a lot of literature has also been written on the subject and many suggestions offered to improve our export performance.

However, the publication under review looks at the problem in a different way. According to the author, export performance could be improved only by effecting a substantial improvement in the earnings from the traditional export commodities such as tea, cotton textiles and jute manufactures. Scrutinising the export performance of these traditional commodities over the last three decades, he has pointed out how very important these items are, as even a slight decrease in their exports would adversely affect the earnings of the country. The importance of monitoring their export trends with caution to keep them competitive in the world market is thus of paramount consideration.

Beginning with a bird's eye-view of India's foreign trade and their trends, the author has highlighted the export pattern of traditional commodities. He has tried to identify the major causes of decline or slow growth in the export of each of these commodities and his detailed analysis makes an interesting reading.

The aim of India's trade agreements, he has pointed out, has always been to obtain capital goods and raw materials without straining foreign exchange resources, creating markets for non-traditional export goods, reducing dependence on traditional export markets, and stabilisation of prices of traditional exports. Terms of trade agreements usually go against the economically weaker nations and hence the imperative need for strengthening the export base.

In his study, Dr Dhindsa has analysed the data from 1950 to 1972 and in some cases until 1978. While admitting the fact that owing to non-availability of data in some cases, the discussion would not be complete or up to date, he has tried to incorporate the latest figures, wherever available, to prove his points. The publication, it may be stated, is a revised version of the author's doctoral dissertation submitted to the University of London in 1975. The study covers the period 1950 to 1977 and is based on data available from published sources.

He has given several tables to substantiate his analysis and conclusions and inferences drawn therein have been quoted from valuable sources like *Statistical Abstract* and *Monthly Statistics of Foreign Trade*—Central Statistical Organisation; *Report on Currency & Finance* and *Reserve Bank of India Bulletin, International Financial Statistics*—IMF; *FAO Commodity Review & Outlook.* various plan documents, etc.

The determinants of export performance in various countries have been reviewed in the recent study. The author has specifically thrown light on two main schools of thought and discussed their theories. One is that of Professor Nurkse who was an ardent advocate of the demand deficiency thesis, taking trade as an engine of growth in the nineteenth century as discussed by him in his book *Patterns of Trade and Development*. On the other hand, Prof A. K. Cairncross supported the supply deficiency thesis in his book *International Trade and Economic Development.* He has reviewed the literature on this subject and concluded that several factors such as relative prices, export taxes, export credit facilities, non-price factors like quality, regularity of export supplies, export marketing services, after sales services, etc and internal and external demand are mainly responsible for export performance in association with demand and supply forces.

The author has then created an export model with two hypothesis. He first analyses world exports of each major traditional commodity and then reviews India's share of these commodities followed by critical analysis of decline in world exports and possible remedies. He has not only critically reviewed the decline but also thrown light on possible remedial measures and future outlook which add to the utility and usefulness of the publication.

One chapter is devoted to summarising statistical results and enunciating policy implications which are an outcome of the analysis, for the benefit of decision-makers, while another chapter puts forth some broad action plans that ought to be taken to promote trade in tea, cotton textiles and jute manufactures, keeping in view the prospects of world market. Some policy implications derived from the study are increasing relative profitability of foreign sales by removing export taxes and central excise duty, etc, promote quality of traditional exports by incentives and subsidies, undertake intensive publicity campaigns, intensify research and development efforts in traditional commodities, etc.

The inclusion of an exhaustive bibliography of important works consulted and which have provided an important insight to the author in crystallising the ideas which have gone into the study would prove to be very helpful to future researchers on the subject. The study is a useful publication not only for the boards and associations of the traditional commodities *viz* tea, cotton textiles and jute manufactures but also for researchers and students, as also for bodies such as FICCI, export promotion councils and other institutions interested in export trade.

The last chapter on "Future Prospects" neatly summarises the position on the export front, especially in the case of the traditional commodities, and suggests measures for improving them. One cannot but agree with the author when he says that to boost exports of cotton textiles and jute goods, due attention should be given to restrain domestic consumption of superfine cloth and cut production costs of the latter. Further, both cotton textiles and jute goods have to face effective competition from synthetic substitutes. But then, the question basically is how much one can reduce costs, lower domestic consumption and improve quality. The publication, however, does not throw light on this.

The book is a welcome addition to the literature in the market and is bound to be useful for both the policy maker as well as the researcher.

Raghu

Growth of urban cooperative banks

Statistical Data on Economic Position of Urban Cooperative Banks in Maharashtra for 1979-80 (Marathi)

*Published by The Maharashtra State Cooperative Banks Association Ltd, Oricon House, K. Dubhash Marg, Bombay-*400 023.

There were 325 urban cooperative banks with a total branch network of 497 in Maharashtra at the end of June 30, 1980. In the 1979-80 cooperative year the number of branches went up by 67, and of them 90 per cent were in western Maharashtra alone. Of the 325 urban cooperative banks, 219 were in audit group A, 69 in group B and 11 in group C. The dispersal of 325 banks was as follows : western Maharashtra 287, Vidarbha 28 and Marathwada 10.

This information is brought forth by the publication under review. Among other salient information mention can be made of the following :— the number of regular members of urban cooperative banks rose 21.8 per cent to 13.22 lakhs as on June 30, 1980; deposits went up to Rs 486.38 crores by about 26.8 per cent, and of this increase in deposits 45.7 per cent was in time deposits and 33.6 per cent in savings deposits. The number of banks with deposits of over Rs 2 crores rose from 39 to 49 during the period, while those with deposits of rupees one crore to two crores increased from 34 to 53. However, those between Rs 51 lakhs and rupees one crore declined from 63 to 54, indicating that more banks from this group moved up to the next group.

A lot of valuable data are presented over nine tables giving the position district-wise, bank-wise, deposits-wise, etc, etc. A really useful reference publication indeed.

The wings of progress

AIR transport can contribute vitally to the Third World development, according to Dr Assad Kotaite, president of the Council of the International Civil Aviation Organisation (ICAO). In an article in the *Development Forum,* published by the United Nations University and the Division of Economic and Social Information, Mr Kotaite said : "It has been said with some justification that a mile of road leads nowhere but a mile of runway can lead anywhere. Surface transport systems in many countries of Latin America, Asia and Africa are severely limited, with unpaved roads often subject to wash-outs during the rainy season and unsuitable for heavy trucks. Lending agencies such as the World Bank and the International Development Association (IDA) are well aware of these deficiencies and are making great efforts to correct them. But the task is formidable and the conclusion inevitable that — at least over the medium term — it may be more economical in many instances to use air instead of surface transport for carriage of certain consignments even though the air freight rate is much higher than the surface rate.

Dr Kotaite adds : "The trend is unmistakable. During the past three decades, civil aviation has emerged as an important and flexible instrument of national development policy. For the medium and longhaul carriage of passengers on international and domestic routes, air transport has become established as the dominant mode. For a growing number of countries, it accounts in terms of value for a significant and rising share of freight movements. Air transport is frequently the only reliable means of access to remote or geographically isolated areas. Aerial work (crop-spraying, aerial photography, medical evacuation) and general aviation are also important domestic activities.

"Civil aviation is one of the few areas of economic activity in which the Third World, is, in many ways, catching up with the industrialised countries. A few figures will prove the point. More than half of the world's airlines and international airports belong to developing countries. The share of world traffic carried by the airlines of the developing world has increased steadily — from 17 per cent in 1969 to 24 per cent in 1979. The highest average annual rates of growth were recorded by the airlines of developing countries in Asia and the Pacific (20 per cent), the Middle East (18.4 per cent), Africa (13.4 per cent) and Latin America and the Caribbean (12.4 per cent).

"This is a great achievement by developing countries, for many of them had to start their aviation development after reaching independence. Nonetheless, figures reveal also that they still have a long way to go. Putting it in another way : all airlines registered in Africa and the Middle East carried less scheduled passenger traffic on their international and domestic routes than the largest single United States airline."

Arrested growth of chemical industry

By P. C. MAHANTI

EASTERN INDIA TODAY

IT is an oft heard complaint in local industrial circles today that while the western region has achieved considerable progress in the production of basic organic chemicals, pharmaceuticals, dyestuffs, high polymers, solvents, insecticides and pesticides, the eastern region has been conspicuously lagging behind. The region consumes as much as 20 to 25 per cent of these products but produces only a small part of what it requires. The production of chemicals in the region has indeed been insignificant.

The reasons for the slow growth of the chemicals industry in the region are several. As Mr B. A. Nagari, president of the Indian Chemical Merchants' and Manufacturers' Association, Calcutta, has enumerated, the factors are broadly the energy crisis, the oil crisis, inadequate supply of industrial raw materials, coal and wagon shortages and high cost of bank credit. Not only have these factors inhibited the growth of new units but even kept a good deal of the installed capacity underutilised. In the plastics industry of the region, for instance, only 57 per cent of the capacity is being utilised. When the olefin complex of the Indian Petrochemicals Corporation went into operation expectations were aroused that the processing of thermo-plastics like low density polythene, high density polythene, polypropylene and PVC would start on a large scale but these expectations have not materialised in any worthwhile sense.

A joint committee set up by a local chamber of commerce to study the possibilities and the potential of the development of chemicals and petrochemical industries in the region has pointed that the only way to get over the present limitations is to build up adequate capacities for heavy organic and inorganic chemicals, basic drugs, dyestuffs and intermediates and pesticides etc. The region does produce a wide variety of chemicals like caustic soda, sulphuric acid, alum, nitric, some fertilisers and some pharmaceuticals including formulations but the quantities in each case are small even to meet the region's need to any appreciable extent.

The committee has suggested that with the resources available in the region it is possible to develop organic chemicals industry. The sick textile industry of the region very much depends on the starting of a dyestuffs and intermediate industry. As for drugs and pharmaceuticals, the eastern region is currently producing only half of what it requires. Out of 64 important drugs and formulations units only seven are located in the eastern region and even then their raw materials are not timely and adequately available. The development of coal tar and allied chemical industries will greatly overcome this problem.

The eastern region grows a variety of cash and plantation crops like jute and tea which need a large quantity of pesticides. As for synthetic detergent units these are beginning to get an impetus from the factory put up in Haldia by Hindustan Lever and in due course the eastern region is likely to develop as an important detergent production centre.

Power crisis

The power problem in West Bengal has become intractable despite what the State Ministry may say. This week for four days (between July 22 and July 25) high tension power consuming industries have been asked to cut their consumption by 50 per cent, priority industries and continuous process plants being the only exceptions. The order came so suddenly that the industrialists were taken by complete surprise and naturally very annoyed that they were not allowed sufficient time to prepare themselves for such a drastic cut. The reason for the cut is the shutdown of a 50 mw unit by the Calcutta Electric Supply Corporation. With the DVC supply being erratic and that by Durgapur Projects practically nothing, the State Government probably had no choice but to impose the cut especially when supplies to domestic consumers have been less than the minimum required. But the point is that could not the power department have taken the major industrial consumers into confidence before taking the step?

The Chief Minister, Mr Jyoti Basu, requested his counterpart in Orissa for a 50 mw power supply for the days that the Calcutta Electric Supply Corporation unit would be down for repairs. With its own position however none too comfortable at the moment, Orissa did not oblige. Mr Basu thereafter requested the Central Energy Minister, Mr Ghani Khan Chaudhury to use his influence. Orissa did at last respond to West Bengal's SOS for some power, but not until the Central Power Minister had intervened. A supply of 30 mw has been promised for five days from July 26 as against 50 mw requested. One expected greater neighbourly co-operation between the two states in the same region no matter which political party ruled where when there is a serious power crisis to be expeditiously tackled.

Objection to ONGC

An interesting commentary on the notion that some of our states and ministers have of their autonomy, whether or not guaranteed by the constitution, is provided by Nagaland recently. While the example shown by Assam is being written into history Nagaland looks like emulating that neighbour. It is objecting to the Oil and Natural Gas Commission exploring oil within the State's territory on the ground that no resolution of the State Assembly has authorised the Commission to do oil exploration here. In doing this the State Government is falling back on Article 321(E) of the constitution which says that "no transfer of land and resources of Nagaland can be made without a resolution passed by the State Assembly".

There are possibilities of a substantial oil discovery in the State. In fact the Commission has already struck oil in the Changhang area of Workha district. It is in national interest that oil resources wherever they are found in the country should be explored and exploited by national agencies like the Oil and Natural Gas Commission. Moreover the constitution also lays down that resources found under the earth fall under the control of the Central Government and as such do not belong to the land or resources that the Article 371(E) visualises. If there is a conflict between the two constitutional provisions, national interest should harmonise it.

Doubly Deadly Shelltox®

2-in-1 Household Insecticide

knocks down mosquitoes dead, and kills cockroaches, bed-bugs, ants.

Shelltox—the most powerful 2-in-1 insecticide

Shelltox contains two powerful insecticides—one has a quick, knock-down-dead effect on flying mosquitoes and insects. The other has a longer-lasting, persistent effect that kills cockroaches, ants, fleas, bed-bugs, etc.

Shelltox comes ready-for-use

Shelltox is safer since you do not have to mix it before spraying. Just pour Shelltox into your sprayer. Close all doors and windows and start spraying. First into space, then behind furniture, curtains, beds—wherever cockroaches and insects hide in the house. Then leave the room and keep it closed for 15 to 20 minutes.

Shelltox is available in ½ litre, 1 litre and 5 litre tins from leading stores and chemists.

Text of ordinance on maintenance of essential services

THE following is the text of the Essential Services Maintenance Ordinance, 1981, *promulgated by the President on July* 27, 1981 :

1. (1) This ordinance may be called the Essential Services Maintenance Ordinance, 1981.

(2) It extends to the whole of India : Provide that it shall not apply to the state of Jammu and Kashmir in so far as it related to any essential service connected with matters with respect to which Parliament has now power to make law for that state.

(3) It shall come into force at once.

2. (1) In this ordinance, unless the context otherwise requires,—

(A) "Essential Service" means :—

(i) Any postal, telegraph or telephone service, including any service connected therewith;

(ii) Any railway service or any transport service for the carriage of passengers or goods by air or any other transport service for the carriage of passengers or goods by land or water with respect to which Parliament has power to make laws;

(iii) Any service connected with the operation or maintenance of aerodromes, or with the operation, repair or maintenance of aircraft, or any service in the International Airport Authority of India constituted under section 3 of the International Airports Authority Act, 1971;

(iv) Any service in, or in connection with the working of any major port, including any service connected with the loading, unloading, movement or storage of goods in any such port;

(v) Any service connected with the clearance of goods or passengers through the customs or with the prevention of smuggling;

(vi) Any service in any establishment of, or connected with, the armed forces of the Union or in any other establishments or installations connected with defence;

(vii) Any service in any section of any industrial undertaking pertaining to a scheduled industry on the working of which the safety of such undertaking or the employees employed therein depends:

Explanation : For the purposes of this sub-clause, the expressions "industrial undertaking" and "scheduled industry" shall have the meanings respectively assigned to them in clauses (D) and (i) of section 3 of the Industries (Development and Regulation) Act, 1951;

(viii) Any service in, or in connection with, the working of any undertaking owned or controlled by the Central government being an undertaking engaged in the purchase, procurement, storage, supply or distribution of foodgrains;

(ix) Any service in, or in connection with the working of, any system of public conservancy or sanitation, hospitals or dispensaries in any Union territory, cantonment area or undertaking owned or controlled by the Central government.

(x) Any service in connection with or in relation to banking;

(xi) Any service in any oilfield or refinery or in any establishment or undertaking dealing with the production, supply or distribution of petroleum and petroleum products;

(xii) Any service in any mint or security press;

(xiii) Any service in connection with the election to Parliament or to the legislatures of the states;

(xiv) Any service in connection with the affairs of the Union, not being a service specified in any of the foregoing sub-clauses;

(xv) Any other service connected with matters with respect to which Parliament has power to make laws and which the Central government being of opinion that strikes therein would prejudically affect the maintenance of any public utility service, the public safety or the maintenance of supplies and services necessary for the life of the community or would result in the infliction of grave hardship on the community, may, be notification in the official Gazette, declare to be an essential service for the purposes of this ordinance.

(B) "Strike" means the cessation of work by a body of persons employed in any essential service acting in combination or a concerted refusal or a refusal under a common understanding of any number of persons who are or have been so employed to continue to work or to accept employment, and includes—

(i) Refusal to work overtime where such work is necessary for the maintenance of any essential service.

(ii) Any other conduct which is likely to result in, or results in cessation or substantial retardation of work in any essential service.

(iii) Any reference in this ordinance to any law which is not in force in any area and to any authority under such law shall, in relation to that area, be construed as a reference to the corresponding law in force in that area and to the corresponding authority under such corresponding law.

(iv) Every notification issued under sub-clause (xv) of clause (A) of sub-section (1) shall be laid before each house of Parliament immediately after it is made if it is in session and on the first day of the commencement of the next session of the house if it is not in session and shall cease to operate at the expiration of 40 days from the date of its being so laid or from the reassembly of Parliament, as the case may be, unless before the expiration of that period a resolution approving the issue of the notification is passed by both houses of Parliament.

Explanation : Where the houses of Parliament are summoned to reassemble on different dates, the period of 40 days shall be reckoned from the later of those dates.

3. (1) If the Central government is satisfied that in the public interest it is necessary or expedient so to do, it may, by general or special order, prohibit strikes in any essential service specified in the order.

(2) An order made under sub-section (1) shall be published in such manner as the Central government considers best calculated to bring it to the notice of the persons affected by the order.

(3) An order made under sub-section (1) shall be in force for six months only, but the Central govern-

ment may, by a like order, extend it for any period not exceeding six months if it is satisfied that in the public interest it is necessary or expedient so to do.

(4) Upon the issue of an order under sub-section (1)—

(A) No person employed in any essential service to which the order relates shall go or remain on strike.

(B) Any strike declared or commenced whether before or after the issue of the order by persons employed in any service shall be illegal.

4. Any persons :—

(A) Who commences a strike which is illegal under this ordinance or goes or remains on, or otherwise takes part in, any such strike; or

(B) Who instigates or incites other persons to commence, or go or remain on, or otherwise take part in, any such strike, shall be liable to disciplinary action (including dismissal).

In accordance with the same provisions as are applicable for the purpose of taking such disciplinary action (including) dismissal on any other ground under the terms and conditions of service applicable to him in relation to his employment.

5. Any person who commences a strike which is illegal under the ordinance or goes or remains on, or otherwise takes part in, any such strike shall be punishable with imprisonment for a term which may extend to six months or with fine which may extend to Rs 1,000 or with both.

6. Any person who instigates or incities other persons to take part in, or otherwise acts in furtherance of, a strike which is illegal under this ordinance shall be punishable with imprisonment for a term which may extend to one year, or with fine which may extend to Rs 2,000 or with both.

7. Any person who knowingly expends or supplies any money in furtherance or support of a strike which is illegal under this ordinance shall be punishable with imprisonment for a term which may extend to one year, or with fine which may extend to Rs 2,000, or with both.

8. Notwithstanding anything contained in the code of Criminal Procedure, 1973, any police officer may arrest without warrant any person who is reasonably suspected of having committed any offence under this ordinance.

9. Notwithstanding anything contained in the Code of Criminal Procedure 1973, all offences under this ordinance shall be tried in a summary way by any metropolitan magistrate, or any judicial magistrate of the first class specially empowered in this behalf by the state government and the provisions of sections 262 to 265 (both inclusive) of the said code shall, as far as may be, apply to such trial.

Provided that in a case of conviction for any offence in a summary trial under this section, it shall be lawful for the magistrate to pass a sentence of imprisonment for any term for which offence is punishable under this ordinace.

10. The provision of this ordinance and of any order issued thereunder shall have effect notwithstanding anything inconsistent therewith contained in the Industrial Disputes Act, 1947 or in any other law for the time being in force.

11. During the continuance in force of this ordinance, the Essential Services Maintenance (Assam) Act 1980, shall have effect as if—

(A) in sub section (1)—

(i) clause (A) had been omitted;

(ii) for clause (B) the following clauses had been substituted, namely :

(B) Essential service means :

(i) Any transport service for the carriage of passengers or goods, by land or water, with respect to which the legislative assembly of the state of Assam has power to make laws;

(ii) Any service connected with the production, storage, supply or distribution, as the case may be, of gas or water;

(iii) Any service connected with the maintenance of public health and sanitation, including hospitals and dispensaries;

(iv) Any public services and posts in connection with the affairs of the state, and also persons appointed to the secretarial staff of the legislative assembly of the State of Assam;

(v) Any other service or employment or class thereof, connected with matters with respect to which the legislative assembly of the State of Assam has power to make laws and which the state government being of opinion that stirkes therein would prejudicially affect the maintenance of any public utility service, the public safety or the maintenance of the supplies and services necessary for the life of the community, may, by notification in the official Gazette declare to be an essential service for the purpose of this act.

(BB) "State Government" means the state government of Assam :

(2) In sub-section (2) for the words brackets and figures "under subclause (v) had been substituted.

(B) In sections 3 and 9 for the words "appropriate government", wherever they occur, the words "state government" had been substituted.

Ottawa summit

The following are excerpts from the communique issued at the end of the summit meeting at Ottawa of seven leading nations—Canada, France, Italy, Japan, West Germany, the UK, and the US :

WE support the stability, independence and genuine non-alignment of developing countries and reaffirm our commitment to co-operate with them in a spirit of mutual interest, respect and benefit, recognising the reality of our interdependence.

It is in our interest as well as in theirs that the developing countries should grow and flourish and play a full part in the international economic system commensurate with their capabilities and responsibilities and become more closely integrated it.

We look forward to constructive and substantive discussions with them, and believe the Cancun summit offers an early opportunity to address our common problems anew.

We are committed to maintaining substantial and, in many cases, growing levels of official development assistance and we will direct the major portion of our aid to poorer countries, and will participate actively in the United Nations Conference on the Least Developed Countries.

We point out that the strengthening of our own economies, increasing access to our markets, and removing impediments to capital flows contribute larger amounts of needed resources and technology and thereby complement official aid. The flow of private capital will be further encouraged in so far as the developing countries themselves provide assurances for the protection and security of investments.

The Soviet Union and its partners, whose contributions are meagre, should make more development assistance available, and take a greater share of exports of developing countries, while respecting their independence and non-alignment.

We will maintain a strong commitment to the international financial institutions and work to insure that

19 AUG 1981
C.F.T.R.I., MYSORE

they have, and use effectively, the financial resources for their important responsibilities.

We attach high priority to the resolution of the problems created for the non-oil developing countries by the damaging effects on them of the high cost of energy imports following the two oil price shocks. We call on the surplus oil-exporting countries to broaden their valuable efforts to finance development in non-oil developing countries, especially in the field of energy. We stand ready to co-operate with them, in a spirit of partnership, possible mechanisms, such as those being examined in the World Bank, which would take due account of the importance of their financial contributions.

We recognise the importance of accelerated food production in the developing world and of greater world food security, and the need for developing countries to pursue sound agricultural and food policies. We will examine ways to make increased resources available for these purposes.

We reaffirm our strong commitment to maintaining liberal trade policies and to the effective operation of an open multilateral trading system as embodied in the GATT.

We will work together to strengthen this system in the interest of all trading countries, recognising that this will involve structural adaptation to changes in the world economy.

We will implement the agreements reached in the multilateral trade negotiations and invite other countries, particularly developing countries, to join in these mutually beneficial trading arrangements.

We will continue to resist protectionist pressures, since we recognise that any protectionist measure, whether in the form of overt or hidden trade restrictions or in the form of subsidies to prop up declining industries, not only undermines the dynamism of our economies but also, over a period of time aggravates inflation and unemployment.

We welcome the new initiatives represented by the proposal of the consultative group of eighteen that the GATT contracting parties convene a meeting at ministerial level during 1982, as well as that of the OECD countries in their programme of study to examine trade issues.

We will keep under close review the role played by our countries in the smooth functioning of the multilateral trading system with a view to ensuring maximum openness of our markets in a spirit of reciprocity, while allowing for the safeguard measures provided for in the GATT.

We endorse efforts to reach agreement by the end of this year on reducing subsidy element in official export credit schemes.

Slower recovery for industrial countries

THE *OECD Economic Outlook* for July 1981 foresees a much slower recovery for the economies of the developed countries than envisaged six months earlier in December 1980. The recovery is now expected to take six months more to begin by December 1981—with important differences in the rates of growth in Europe, Japan and the United States.

In Europe, partly because of important exchange rate changes and tighter monetary policy, output in the bigger countries could decline by about 1 per cent this year, before growing by 1½ per cent in 1982, helped by a depreciation-assisted boost to exports. In Japan, GNP may grow at about 3-3½ per cent until next year, when it could accelerate. The outlook for the United States is subject to more than usual uncertainty. The OECD forecast is that the recent buoyancy will give way to only modest growth, accelerating through the ½-2½ per cent range during 1982, with continuing high interest rates moderating the recovery. Should inflation slow more quickly than in this forecast, growth could be correspondingly more buoyant, particularly next year. Published forecasts from other sources range from growth rates below those of the OECD to real growth for 1982 in the region of 5 per cent, which is the outcome foreseen by the United States Administration.

Unemployment on these projections will rise in most countries throughout the next eighteen months, perhaps from the present rate of just under 7 per cent of the labour force to nearly 7½ per cent, some 26 million-people, by the second half of 1982. In Europe the rate could be over 9 per cent. The unemployment rates of relatively disadvantaged groups will be even higher; youth unemployment in some European countries may top 20 per cent.

Inflation: As the oil price pulse and its subsequent price effects gradually dwindle, the annual rate of inflation should, on that count, drop progressively. Weak commodity prices, a quiescent oil market in coming months and moderating wage growth should assist this. Taking all the main factors into account, the outlook is for a progressive deceleration of OECD consumer price inflation, from a rate of around 10 per cent (annual rate) in the first half of this year to about 8½ per cent in the second half of 1982. The divergence between countries is likely to be considerable: among the larger countries, inflation in Germany could be around 3½ per cent in the latter part of next year, whereas in Canada the rate could still be 10 per cent, and in Italy about 15 per cent. And of the smaller countries, half seem likely to have double-digit inflation by the end of next year, while a few may succeed in bringing inflation down to around 5 per cent.

Current balances: The 1981 current deficit for the OECD area should

Growth of real GNP/GDP

Percentage changes seasonally adjusted at annual rates

	From previous year			From previous half-year			
	1980	1981	1982	1981 I	1981 II	1982 I	1982 II
United States	−0.2	2½	1	5	½	½	2½
Japan	4.2	3½	4	3½	3	4	5
Four major European countries	1.3	—1	1½	—½	—½	2	2¾
Other OECD countries	1.6	1½	2¾	1½	2	3	3¼
Total OECD	1.3	1¾	2	2½	1	2	3

be lower than in 1980. Differential GNP growth rates, in combination with past movements in competitive positions, could lead to an increased dispersion of current account positions this year. Next year, however, as the lagged adjustment of trade volumes to the recent exchange rate changes becomes important, the dispersion of current account positions of major countries could narrow considerably. Germany, which now has the biggest current account deficit, could well see a significant improvement. On present evidence none of the major countries seems likely to have a 1982 deficit much larger than $5 billion. The smaller OECD countries will take a bigger share of the area deficit—perhaps between $25 and $30 billion.

Overall the OECD area deficit may fall by around $30 billion between 1980 and 1982. The OPEC current surplus seems likely to fall somewhat, from about $110 billion this year to a still-substantial $60-70 billion next year. The decline is being slowed by the European currency depreciation, which improves OPEC's terms of trade.

The deficit of the developing countries, by contrast, seems likely to increase this year, perhaps by around $10 billion, and is unlikely to fall in 1982. This projection is based on a cautious view of the finance likely to be available to developing countries. If financing were to be more or less restricted than assumed, developing country imports would alter accordingly.

It is necessary to resist, in this transitional period of slow growth, protectionist or market-weakening measures. Unfortunately, a plethora of inappropriate incentives to export, sometimes in combination with disincentives to import, becomes increasingly tempting. The situation may be exacerbated to the extent that the protection of domestic industry offsets the positive effects on inflation that might be expected when demand is weak, and interferes with desirable medium-term structural change by reducing competition among enterprises.

Experience shows that direct intervention in price and wage formation may simply create distortions and pent-up inflationary pressures. It remains true, however, that as well as resisting inflationary behaviour by non-accommodating financial policies, there is much to be said for trying to harmonise the income claims of business and labour in tune with available resources. In particular, increased awareness may be necessary where there is reduced scope for increases in private real incomes, given reduced growth potential, worsened terms of trade, rising public expenditure or the need to improve profitability and productive investment.

Boosting investment in physical and humans capital must be a key objective of economic policy in most countries to assure both the more vigorous expansion of productive potential and the creation of adequate new employment opportunities. Such an expansion may, however, be difficult to achieve in circumstances of relatively weak demand growth and hence limited pressure on existing productive capacity. Nevertheless, the change in the relative price of energy may in some countries provide an incentive to invest. Moreover there is evidence that stimuli working through the expected rate of return to enterprises can have a significant effect on investment even in the absence of strong demand pressures. A restructuring of fiscal systems where they weigh against investment—particularly through distortions associated with the effects of inflation on company profits—might be the most promising approach. Temporary or targeted measures may also have some scope, though such actions probably have stronger effects on the timing of investment than on the total undertaken, and may introduce administrative distortions.

THE STANDARD MILLS COMPANY LIMITED

Registered Office : Mafatlal Centre, Nariman Point
Bombay 400 021.

NOTICE is hereby given that the EIGHTYSIXTH ANNUAL GENERAL MEETING of the Members of THE STANDARD MILLS COMPANY LIMITED, will be held at Patkar Hall of S.N. D.T. Women's University, 1, Nathibai Thackersey Road, Bombay-400 020, on Tuesday, the 1st September, 1981, at 3-00 P.M. to transact the Ordinary and Special Business set out in the NOTICE dated 14th July, 1981.

The said Notice dated 14th July, 1981, along with the relevant Explanatory Statement pursuant to Section 173 of the Companies Act, 1956, and the Annual Report and Statements of Accounts for the financial year ended 31st March, 1981, are being posted to the Members individually at their registered addresses.

Pursuant to the provisions of Section 194 of the Income-tax Act, 1961, Members (not being Companies) desiring to file Tax Exemption Certificates issued by the Income-tax Officer or Statements in Form No. 14-B (in duplicate), are requested to forward the same so as to reach the Company's Share Department at Rustom Building, 29, Veer Nariman Road, Bombay-400 023, on or before 12th August, 1981, in order to get the dividend without deduction of tax at source. Blank 14-B Forms will be supplied to the Shareholders on request.

NOTE : A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER

By Order of the Board
B. D. DATAR
SECRETARY

Dated : 14th July, 1981

Potential output growth can also be damaged by loss of skills and reduced training, as well as by labour market inflexibilities which impede sustainable employment growth. Measures to improve the quality of training and the responsiveness of labour markets, which are also useful in the battle against inflation, have a role to play here. They might include reducing non-wage labour costs, targeting employment subsidies towards the marginal participants in the labour market, fostering labour mobility by transfer, retraining and housing policies, and reforming unemployment insurance schemes, apprenticeship schemes, training programmes and minimum wage laws.

Public sector : Reducing the share of public sector expenditure in GNP is in many countries a goal in its own right, but care may have to be taken to ensure that reductions in public expenditure do not weaken needed public investment, which too often proves to be the least difficult expenditure item to cut. Where expenditure cuts are appropriate they could to some extent be offset by tax cuts to stimulate saving, support demand or reduce prices. Furthermore, a review of governmental regulation could permit markets to operate more effectively, without significantly impairing the achievement of the goals currently sought by regulation.

—A FEATURE

Textile Machinery: SLACKNESS IN DEMAND

A profile of textile machinery in India

By A SPECIAL CORRESPONDENT

THE textile machinery industry in India has made rapid progress in the manufacture of complete machinery as well as components and accessories in the last few years. There are about 100 machinery manufacturers in the large and medium scale sectors manufacturing complete machinery and over 250 manufacturers in the small scale sector manufacturing components and accessories. The industry's licensed capacity at current prices for complete machinery is estimated at Rs 360 crores and the installed capacity at Rs 240 crores. The industry has been producing machines not only for the cotton type of spinning system, but also for the other fibre groups like jute, wool, synthetics and man-made fibres, and natural silk. It produces the complete range of equipment required for spinning and spinning preparatory, weaving and weaving preparatory, processing and finishing operations. Besides, it also produces a number of electronic testing equipments and controls. Thus the industry is a comprehensive industry covering practically every need of the textile industry.

Years	Complete machinery (Rs crores)	Components/ accessories (Rs crores)
1975-76	80.39	53.96
1976-77	95.68	53.31
1977-78	89.53	54.02
1978-79	134.31	67.39
1979-80	170.00	70.00(I)
1980-81 (E) ..	200.00	90.00

The Indian textile machinery industry has entered a new era of sophistication. Most of the major machinery manufacturers have gone in for new collaboration agreements with reputed foreign machinery makers. Accent will definitely be on producing and supplying machinery of better quality, improved design, higher speeds and greater productivity. Following is a list of new collaborations, new technologies, and new items that would be made available to the user industry during the next two or three years :

Modernisation

The Indian textile machinery industry will be investing on expansion programmes and technological upgradation over Rs 100 crores in the next five

Name of Company	Collaboration with	Items to be manufactured
Spinning Preparatory and Spinning Machinery :

years. The approximate break-up of the investments will be about Rs 70 crores in spinning and spinning preparatory, about Rs 20 crores in weaving and weaving preparatory and about Rs 35 crores in processing, finishing and other types of machinery. With these additional investments and expansions, the textile machinery industry's production programme for the next four years is expected to be as shown in the table on page 5.

The well known soft loan scheme floated by the Industrial Development Bank of India is more better known as the mill modernisation scheme. This was meant primarily to permit mills whose age worn machinery made them unprofitable to operate and this acted as a drag to the company's revenue earning efforts. This also proved a boon to Indian textile machinery manufacturers who coincidentally were having a slack period at the time the scheme went into operation. The order books of the machinery manufacturers soon filled and deliveries became the number one problem with complaints from customers that they took anything from two to five years. However, major manufacturers refuted this charge saying that they were able to deliver the goods within a year and a half at the most.

At present the order book position is comfortable through nothing to be ecstatic about. One of the reasons is

ECONOMICS

When you invest in textile machinery from MMC, you automatically become a beneficiary of our "Equipment Economics".

What does it all mean ? It means first that MMC, with its cumulative experience in engineering, takes into account varied customer needs when establishing parameters for designing and manufacturing textile equipment. It also means that each MMC textile machine embodies the enduring qualities of efficiency, economy and reliability.

The value you are assured in MMC textile machinery, will ultimately be translated into profitability.

MMC Equipment Economics delivers value. Can you afford less ?

that market conditions for the textile industry have taken a turn for the worse. Another is that quite a number of mills have already implemented the first phase of their modernisation programme. They were waiting to go in for the second phase which would take some time. Fresh applications for loans under the scheme have become fewer although this is not apparent from figures released by the Textile Machinery Manufacturers Association (India) (TMMA) which show that on March 31, 1981 243 applications worth Rs 358.76 crores were sanctioned as against 193 worth Rs 268.57 crores on the same day the year before.

A recent delegation of the TMMA to Bangladesh under the leadership of Mr Atul Bhagwati, chief of Associated Textile Engineers, arrived at the conclusion that a huge scope prevailed for the export of Indian textile machinery to Bangladesh because of its proximity, similar working conditions as in India and low cost of services.

In its report, however, the delegation cautioned against underestimating the competition from West Europe, Japan and China who were offering various facilities in payment and attractive prices on C & F basis.

The psychology of buyers in Bangladesh and the stage of development there, was nearly the same as what the machinery manufacturers faced in India during the fifties and early sixties. Frequently a small problem was exaggerated much more than its worth. Bangladesh being a smaller country and having major industrial development around Dacca and Chittagong, people came to know very fast about such problems. One of the cases of Indian supplies of velvet looms and processing equipment had been repeatedly posed to the delegation at all meetings.

In view of the huge expansion and modernisation programme that Bangladesh has planned, the TMMA has advised members to explore the possibility of manufacturing components, spare parts and simpler machines in Bangladesh under joint ventures or technical collaborations.

The report concluded that the Bangladesh market should be given special importance as far as the textile machinery industry was concerned so that full advantage could be taken of geographic proximity and similar working conditions.

The background to the visit of the delegation was reports that India's competitors in Europe and Japan were engaged in a subtle excercise in downgrading Indian textile machinery by exaggerating some minor problems connected with Indian machines. India has already supplied two complete spinning mills of 25,000 spindles each and balancing machinery for two other mills. In Bangladesh, all the spinning mills and composite mills are nationalised and managed by the Bangladesh Textile Mills Corporation (BTMC). The government has now planned to set up 33 spinning mills each of 12,500 spindles. 30 mills would be permitted to be set up in the private sector and three mills would come up under the aegis of the BTMC. As Poland, Romania, the UK, West Germany, Japan were known to be offering lines of credit even on a government to government basis, the TMMA pursuaded the Industrial Development Bank of India to offer a line of credit up to Rs 15 crores.

Gold-mine in the Philippines?

Another delegation to the Philippines, Hongkong, Taiwan and Bangkok came away with considerably less optimism than the one which went to Bangladesh for the very reason that Taiwan which has four million spindles and 72,000 looms has incorporated the most sophisticated machinery including the latest open-end spinning and air-jet looms. To this, one can add 6500 circular knitting machines and 600 warp knitting machines. Hongkong also proved a disappointment as they were able to get looms from China at very low rates with which India could not hope to compete. Even in Thailand, where the textile industry is controlled mostly by people of Indian origin, the delegation feels that intensive and continuous efforts might provide a breakthrough into the Thai market.

Only in the Philippines did the delegation strike gold. The Filipino textile industry consists of a hundred mills of which only 24 are integrated. The total number of spindles is 1.23 million and looms 25,777. 80 per cent of the spindles need replacement or modernisation. The government has initiated a programme for scrapping 501,000 spindles which are pre-1965. Nearly 2,74,000 spindles installed between 1968 and 1974 have to be rehabilitated and an expansion planned to reach 480,000 spindles up to 1985. 916 looms are also to be immediately replaced, 12,000 to be rehabilitated and 40,000 new looms to be installed up to 1985. The textile industry in the Philippines has a knitting capacity for 23.3 million *i.e.* 15.4 million sq metres and a finishing capacity of 621.2 million metres. There are 60,000 people employed by the industry. The World Bank has extended to the Filipino textile industry a loan of US $ 150 million which was likely to be repeated for two more years making an aggregate of US $ 450 million. Since the disbursement of the loan is to be done through a committee consisting of representatives from the Board of Investment, Development Bank of the Philippines and the ministry of industries, none of whom are technically qualified, the Shirley Institute has been appointed as consultants. Deliberations with them has revealed that global tenders would be called for, for the supply of equipment/utilities and civil engineering. They also gave the delegation to understand that the apart from being utilised for the purchase of capital equipment a significant portion of the loan would be allocated to meeting the training needs of the country in the textile field which would cover not only the existing personnel but utilised in setting up academic institutions for providing training in textile technology to make available trained textile manpower on a continuous basis for the future. To enable the existing personnel to be trained, short-packed courses and in-built training programmes would also be planned.

The delegation received a good coverage in the local press and got a half-hour live broadcast on Manila TV where Mr Kapadia was interviewed.

A revolutionary concept in heat transfer

By NANDISH MEHTA

EVER since the formation of OPEC people the world over have become conscious about conservation of fuel, either by saving in energy with direct reduction in it's use or by devising means to reduce consumption for the same output or by re-using the energy which was released to atmosphere as spent fuel.

Textile processing machinery manufacturers are no exception to this general trend and practically all of them have attempted to contribute to saving in energy — in particular that of stenters either to pre-heat the air or heat the water required for other processes.

A revolutionary new concept of using evaporated moisture from the fabric as heat transfer medium and thereby saving fuel to the extent of 35 per cent with corresponding increase in production by 40 per cent has been practically implemented by Primatex Machinery Pvt Ltd, Bombay in their new stenter model FS-400 which was exhibited at India-Itme.

Why is it necessary to have an exhaust in a stenter? There could only be two reasons : (1) To remove effectively the evaporated moisture from the fabric in the machine. (2) To remove the volatile matter if any, from the evaporated vapour for safety reasons.

Now, let us consider each of these reasons in their proper perspective.

Exhausting for removal of moisture

It is general knowledge that if the evaporated moisture of the fabric is not effectively removed from the circulating hot air in a Stenter, the over-all drying efficiency will reduce as the moisture might condense. And to remove one part of moisture effectively and economically it has to be mixed with nine parts of dry air by weight.

Hence, the exhausting capacity of a stenter has to be equivalent to exhaust ten times the moisture evaporated by it.

Exhausting of such a large quantity results in a low pressure inside the machine and leads to rushing of atmospheric air into the machine. Additional energy has to be consumed to heat this fresh atmospheric air to the required temperature.

The only way of saving this additional energy is to see that no fresh air enters the machine, and the only way to ensure that fresh air does not enter the machine is to see that the pressure inside the stenter is slightly higher than that of the atmosphere. How can this be achieved ? Of course, by stopping the exhaust and accumulating the evaporated vapour, provided in that the vapour so accumulated does not condense.

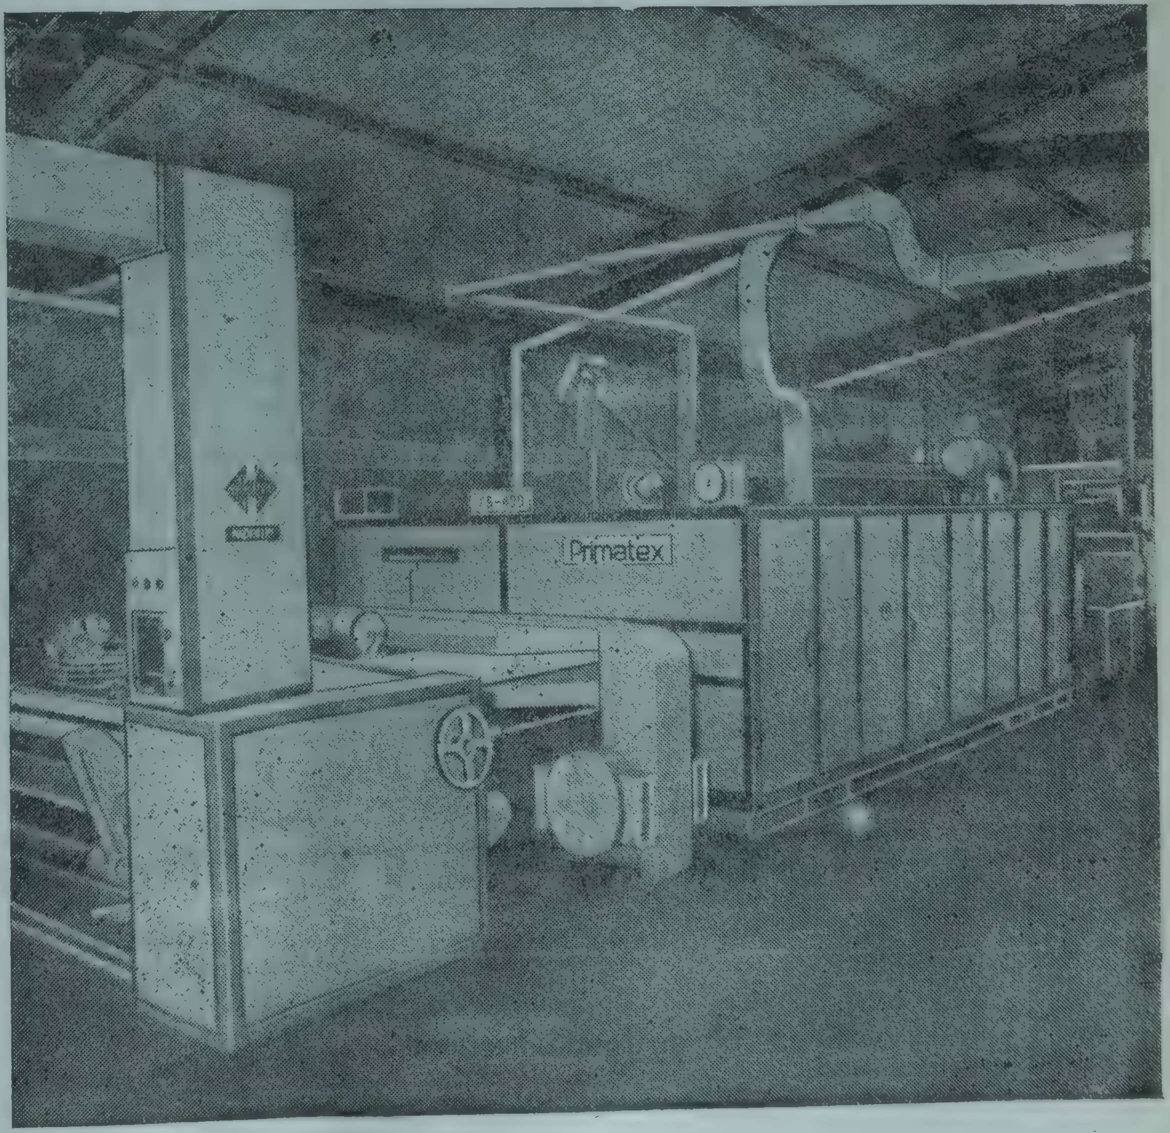
Exhausting of volatile matter

In the event of the evaporated moisture consisting of any volatile matter, it is definitely a safety hazard if the same is not exhausted. However, the volatile matter is hazardous only when it's pressure and the contents exceed the explosive limits. Therefore, if a device was incorporated inside the machine to continuously sense the pressure and automatically start the exhausting of the volatile vapour at a set safe pressure, then it will be quite safe to keep the exhaust normally closed. By not exhausting the vapour most of the time, as explained above, no fresh air would enter the machine, resulting in considerable saving in fuel consumption.

The revolutionary new concept for saving of energy on stenters, invented and developed by Primatex, is based on this basic concept explained above. It will be interesting to understand as to how this new concept has helped the company to achieve a fuel saving of 27.7 per cent without affecting the production and further, as to how this new concept has been integrated with the new stenter model FS-400 which runs at 40 per cent higher speed both for drying and heat-setting, and fuel economy of 35 per cent for every kg of water evaporated.

New concept on existing stenters/dryers

The principle of energy saving by stopping of exhaust on the existing stenters and dryers can be applied, provided that : (i) Condensation of water vapour is totally avoided *i.e.* no part of the machine or the circulating medium is at a temperature below 120°C (a safe tempe-

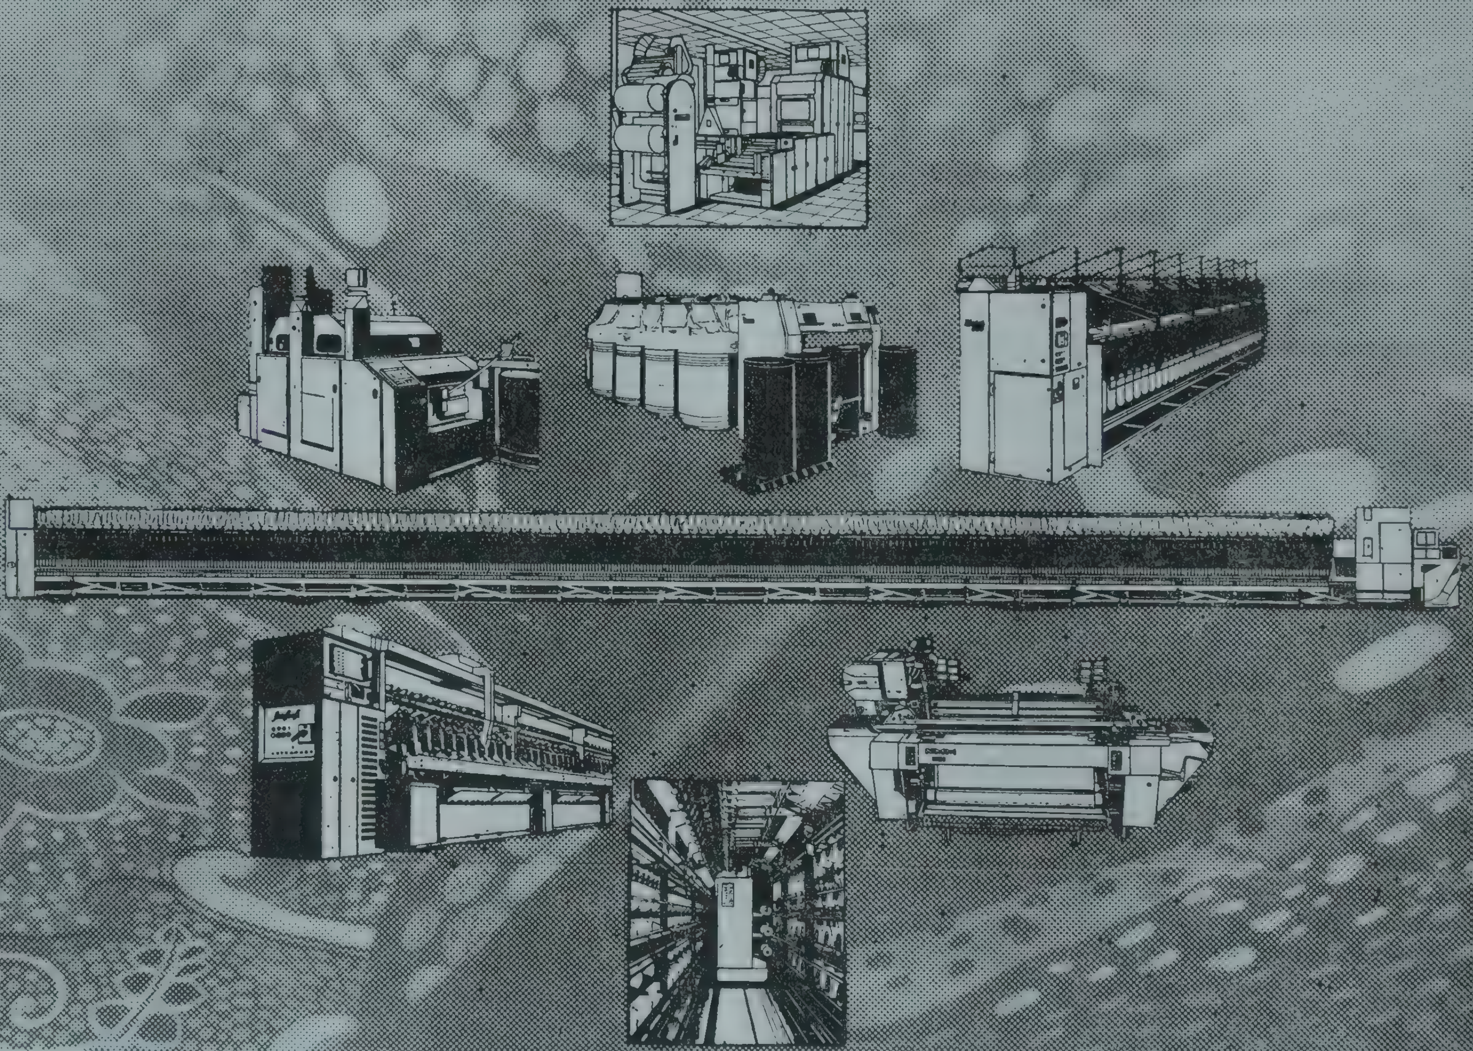


Primatex Stenter Model FS-400

Mr Mehta is managing director, Primatex Machinery Pvt Ltd, Bombay.

Mafatlal Engineering Leadership is helping produce more & better textile machinery...

enough to keep pace with growing demands.



The Sixth Plan envisages an increase of 360 million kg. in yarn production and 2,800 million metres in cloth production by 1982-83. And Mafatlal Engineering Industries is fully geared to produce a variety of highly sophisticated textile machinery, to help achieve this target. In this, Mafatlal Engineering Industries is backed by collaborations with leading textile machinery manufacturers of the world. This is how Mafatlal Engineering technology is helping the textile industry grow, year after year. Mafatlal Engineering Industries' commitment to the textile industry is bringing manifold benefits in manifold ways.

a name you can trust.

rature for avoiding condensation). (ii) Adequate alterations are made to sense the pressure inside the machine and automatically control the exhaust.

Assuming that the consensation does not take place on existing machines, the energy saving can be worked out as under :

The capacity of a chamber (field) of a stenter/float dryer available today is generally specified as 180 kg of water evaporated/hr for a standard cotton fabric of 110 gms/m unsized and unbleached, containing 100 per cent initial moisture and 8 per cent residual moisture after drying, provided that the temperature of the air heated over the radiator inside the chamber is maintained at 150°C.

Capacity of exhaust air required: = 9 x wt of water evaporated = 9 x 180 kgs/hr = 1,620 kgs/hr.

Therefore, the quantity of fresh air entering the machine will be 1,620 kgs/hr. Heat required to raise the temp of this fresh air from 30°C to 150°C will be 1,620 kg/hr x average specific heat x temp diff = 1,620 x 0.243 Kcal/kg/°C x (150° — 30°) = 47,239.2 Kcal/hr. Therefore, in the event of stopping of exhaust, the energy saved per chamber would be 47,239.2 Kcal/hr.

The total heat required on a stenter for evaporating 180 kg of water/hr is = heat required for evaporating water + heat taken away by fabric + heat required for heating the fresh air due to exhaust + conduction losses through insulations = 180 x (100°—70°) x 1 + 180 x 540 + 180 (150°—100°C) x 0.464 (specific heat of vapour) + 180 kgs (Wt of fabric)/hr x (100—30) x 0.32 (specific heat of fabric) + 47,239.2 (Heat required for heating fresh air) + 5,122 (Minimum loss of heat due to radiation/hr/chamber) = 113,976 + 4,032 + 47,239.2 + 5,122 = 1,70,369.4 Kcal/hr

Saving of heat due to stopping of exhaust will be

$$\frac{47,239.2 \times 100}{1,70,369.4} = 27.7\%$$

(It will be interesting to note that the steam consumption in this stenter will be :

$$\frac{1,70,369.4 \text{ Kcal/hr}}{494 \text{ (Kcal per kg of steam at 7 kg/cm pressure)}} = 344.877 \text{ kgs of steam/hr or } \frac{344.877}{180} = 1.915 \text{ kgs of steam/kg of } H_2O$$

evaporated and claims of steam consumption of less than this figure are totally baseless, provided that the rates of 9 : 1 for air to moisture is maintained in the entire chamber).

Now, let us examine the problem of condensation of water vapour on the existing stenter chambers if the exhaust was to be totally closed. As mentioned before, the minimum temperature anywhere in the machine should never be less than 120°C for avoiding condensation.

Considering the prevailing conditions in the mills, the temperature of circulating medium after heated by steam radiators is in the region of 130°C/135°C and for such conditions the minimum quantity of circulation of vapour can be worked out as under :

Quantity of vapour to be circulated

$$= \frac{\text{Total heat required — Heat in exhaust}}{\text{Sp heat of vapour x Sp wt of vapour x Drop in Temp.}}$$

$$= \frac{1,70,369.4 - 47,239.2}{0.464 \times 0.5797 \times (132.5^\circ - 120^\circ)} = 36,591 \text{ m}^3\text{/hr.}$$

Therefore, on the existing stenters and dryers, where the circulation of medium is maximum up to 32,000 m³/hr, there are chances that the vapour will condense in some part of the machine and the droplets of condensed vapour will fall on this fabric.

Even if, by some means, the circulation per chamber on the existing stenters is increased above 36,591 m³/hr, it is absolutely necessary that the vapour after striking the fabric and having lost the heat whereby its temperature has dropped to 120°C, is returned immediately through proper, guided return passages to the radiators for re-heating, before it starts condensing.

Problem of volatile vapour

As discussed earlier, the exhaust system will have to be provided where the stenter/dryer is used for evaporating volatile matter from the fabric. Assuming that an automatic system of opening the dampers in the exhaust duct coming out from the top of the machine is installed in the existing machines, so that the dampers would open where the pressure in the machine exceeds the safety limits, the problem of condensation would still remain, because the damper in the exhaust duct would be generally closed and the temperature of ducting would be almost room temperature. In the eventuality of the damper being opened when the vapour pressure inside the machine exceeds the set limit, vapour coming in contact with cold ducting would condense and droplets will fall on the fabric.

Therefore, in order to successfully use this new concept of energy saving by stopping the exhaust on existing machines, the present system of exhaust from top of the machine will have to be considerably modified.

Problem of drying efficiency

In the above analysis of energy saving, by changing the medium from air to vapour, we have always assumed that the drying efficiency remains unchanged and hence the evaporation capacity of chamber remains 180 kgs/hr. Is this assumption correct ? Any logical mind would react with a loud "impossible"! Because how can water vapour, even though in the form of superheated steam at 150°C further remove water from the fabric at the same rate as that of dry air at the same temperature !

Theory of fabric drying

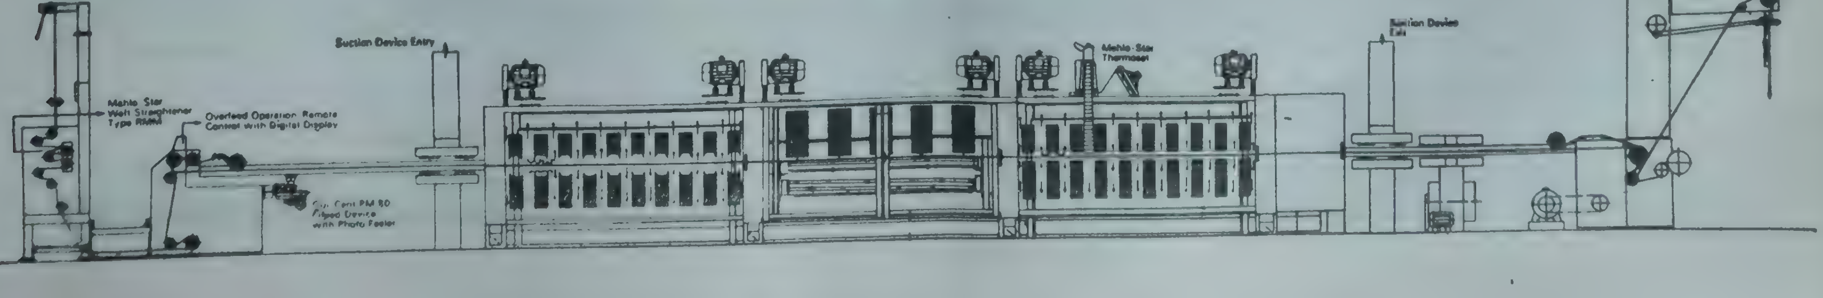
Evaporation of moisture from fabric in a forced convection system like the one adopted in a stenter/dryer, can be divided into two phases : (1) Raising of water temperature in the fabric from 30°C to 100°C. (2) Change of phase from water to its vapour.

The phenomenon of temperature of water in the fabrics rising from 30°C to 100°C is purely a process of heat transfer by conduction and the rate of heat transfer by conduction is directly proportional to the product of specific heat and specific mass of the medium supplying the heat. Therefore, when the heating medium is changed from air to steam, the rate of heat transfer will be increased in the proportion of

$$\frac{0.464 \text{ (Sp heat of steam) x } 0.5797 \text{ (Sp wt of steam)}}{0.243 \text{ (Sp heat of air) x } 0.833 \text{ (Sp wt. of air)}} = 1.328$$

Therefore, the rate of heat transfer for raising the temperature of water in a fabric from 30°C to 100°C, with steam as a medium, is 32.8 per cent more than with air as a medium.

In the second phase, *i.e.* change of phase from water at 100°C to its vapour,



HARISH ROTARY ND4

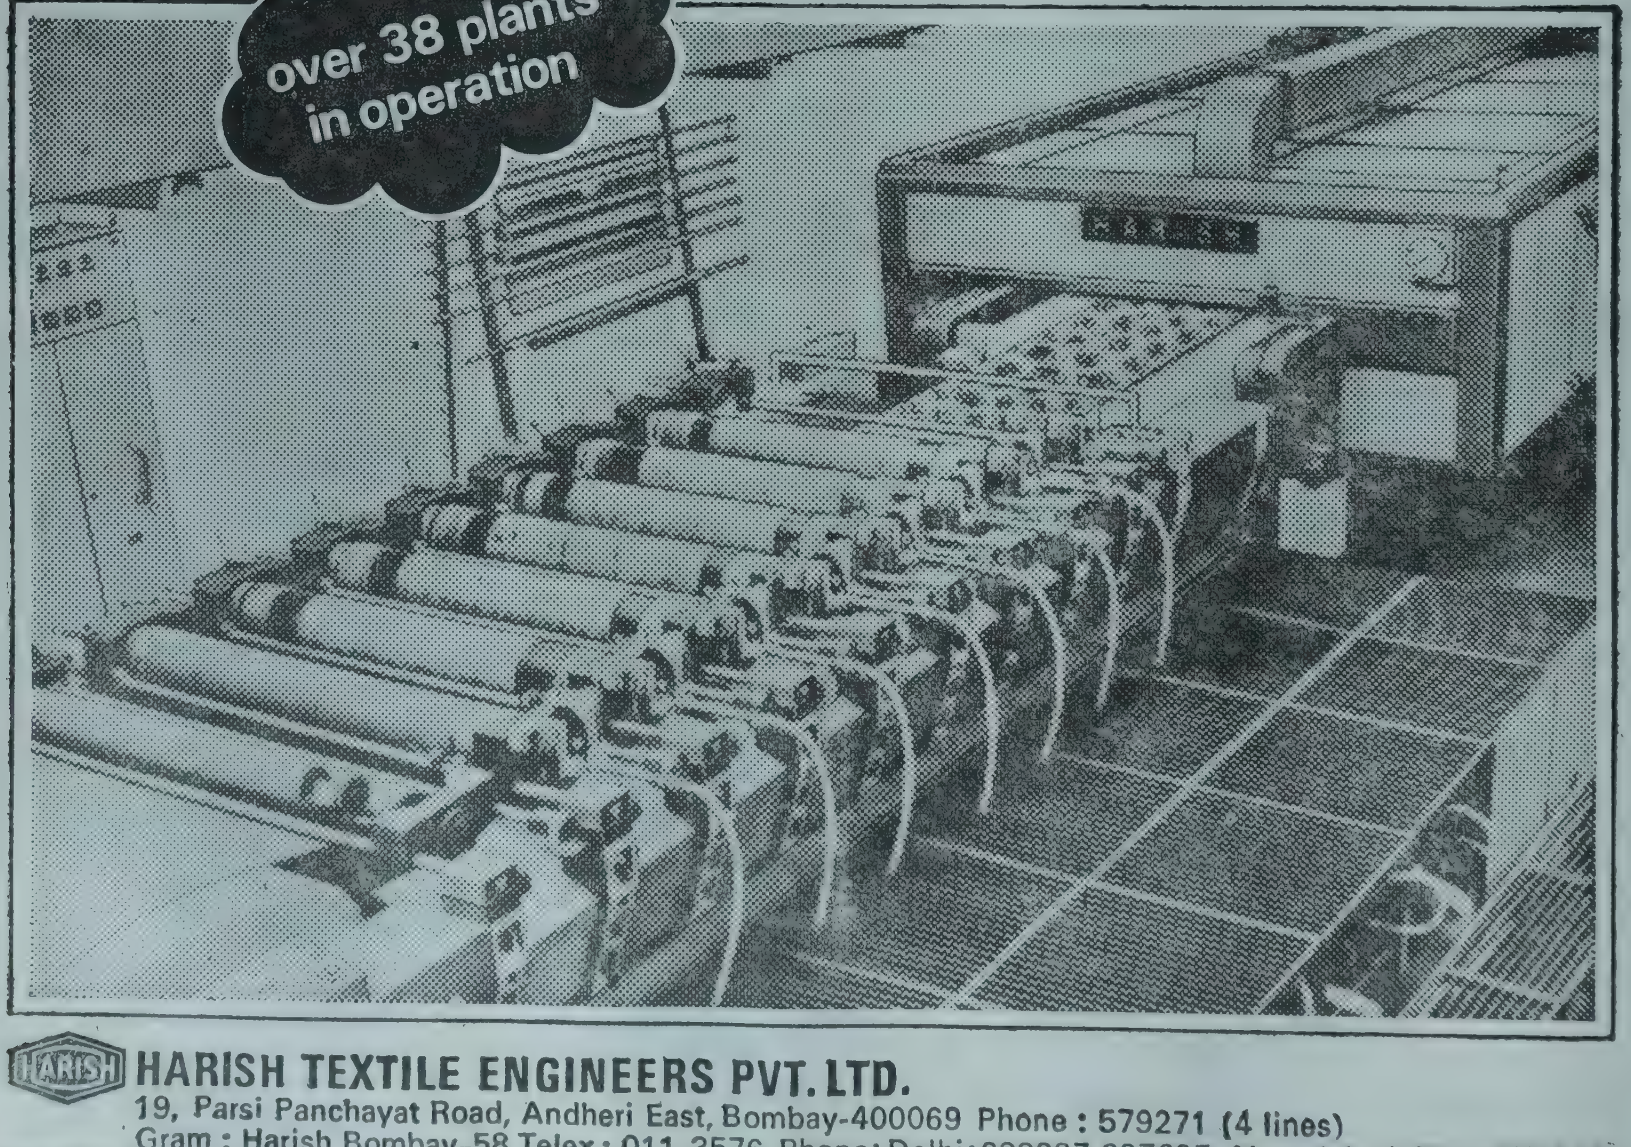
THE TIME TO KNOW THE DIFFERENCE IS NOW

Harish Rotary Screen Printing Plant ND4 incorporates the latest innovation in textile printing technology. No doubt a large number of major textile processing houses prefer the Harish Rotary ND4 as their prime choice.

The special features of Harish Rotary ND4 include :

★ Choice repeat 457 or 640 mm.
★ Finger touch controls for hairline registration and diagonal adjustments of Screens.
★ Magnetic squeegee with improved magnetic beams for even and cushioned pull.
★ Perfectly ground squeegee rods.
★ Automatic blanket lowering at printing stoppage stage to ensure rotation of screens. Thus no damage to cloth.
★ A range of screens for every requirement. Harish Nickle Screens for colour penetration. Harish Rider Screen for hairline sharpness impressions. Harish 2-ply Screen for durability and economy. Combination of all three screens to produce a two-tone effect and where design consists of heavy blotch with fine outlines.

The entire range of textiles-from synthetics to the extreme range of needle felt carpetings-Harish Rotary ND4 has proved its versatility.



IMAGEMAKERS-HTE-81-1

HARISH TEXTILE ENGINEERS PVT. LTD.
19, Parsi Panchayat Road, Andheri East, Bombay-400069 Phone : 579271 (4 lines)
Gram : Harish Bombay-58 Telex : 011-3576 Phone: Delhi: 633287, 637695 Ahmedabad: 77002, 78836

the phenomenon is that of combined heat and mass transfer. The rate of combined heat and mass transfer is governed by the formula :—

$$\text{Sp. heat} \left| \frac{\text{Thermal conductivity}}{\text{Sp. heat} \times \text{Sp. Wt.} \times \text{mass Diffusivity}} \right| 0.67$$

$$\text{Therefore, } \frac{\text{rate of mass transfer with steam}}{\text{rate of mass transfer with air}}$$

$$= \frac{0.464}{0.243} \times \left| \frac{0.0171 \times 0.243 \times 0.833 \times 0.99}{0\ 0193 \times 0.464 \times 0.5797 \times 1} \right| \frac{0.67}{} \quad 0.67$$

$$= 1.909 \times (0.66) \qquad = 1.909 \times 0.757$$

$$= 1.445$$

Therefore, the change of medium from air to steam will result in 44.5 per cent increase in the rate at which the water at 100°C will change its phase into its vapour.

The combined effect of increase in heat transfer rate of 32.8 per cent for phase 1 and 44.5 per cent of phase 2 will mean an overall increase of heat transfer of 43.2 per cent as computed below :—

$$\frac{(100-30) \times 1.328 + |\,540 + 0.464 \times (150^\circ - 100^\circ)\,| \times 1.445}{(100-30) \times 1 + |\,540 + 0.464\,(150^\circ - 100^\circ)\,| \times 1}$$

$$= \frac{92.96 + 813.8}{70 + 563.2} = \frac{906.76}{633.2} = 1.432$$

The actual trials conducted on the existing Primatex hot air stenter has shown that the efficiency of heat transfer and thereby the evaporation capacity of the chamber has gone up by 40 per cent when the circulating medium was changed from air to steam.

Model FS 400

From the foregoing, we can conclude that, the new concept of using evaporated water from the fabric as a circulating medium in stenter/dryer can be implemented effectively provided :

(1) The rate of circulation in the machine is maintained above 36,591 m^3 /hr. (2) Adequate return passages for every strike of vapour jet over the fabric are provided to avoid condensation of vapour. (3) The heat transfer capacity of the radiator is maintained at a minimum of 200,000 Kcal/hr. and (4) The exhaust position is changed below the fabric line with adequate safety precautions.

Considering these four parameters, Primatex has designed the new stenter model FS 400 with the following features :

1) Increased circulation from 32,000 m^3/hr to 40,000 m^3 /hr by providing two additional circulating fans per chamber within the same available space and without reducing the nitch size.

2) Jet nozzles radically modified for providing adequate and guided return passage for the circulating vapours without reducing the jet velocity.

3) Existing radiator design being of 200,000 Kcal/hr capacity has been retained without any modifications.

4) Exhaust suction points have been shifted at the bottom, below the fabric line and a new safety device has been developed for sensing the chamber pressure and to automatically control the exhaust operation for a pre-set pressure.

With these new features, Model FS 400 has (1) Increased evaporation capacity of 260 kg of water/hr/chamber. (2) The consumption of fuel is 35 per cent less for the same production *i.e.* 1.43 kg of steam/kg of water evaporated or 700 Kcal/kg of water evaporated.

In addition to the feature explained above, Model FS 400 also incorporate certain additional features as explained below :

(1) *Overfeed computer* : The new overfeed device for Model FS 400 stenter provided with a slat chain, whereby the advantage of the toothed belt of earlier design is retained and the overfeed drive is without a slip. The overfeed control is motorised and a digital device indicates the actual overfeed of the fabric by sensing the speed of fabric at entry and exit.

While the digital indication is provided at the entry control board, the push buttons for adjusting the overfeed are both at entry and exit so that excess overfeed can be avoided and/or machine speed can be adjusted. With this novel method, the optimum parameters of the heat setting process can be ascertained directly on the machine without resorting to elaborate laboratory tests.

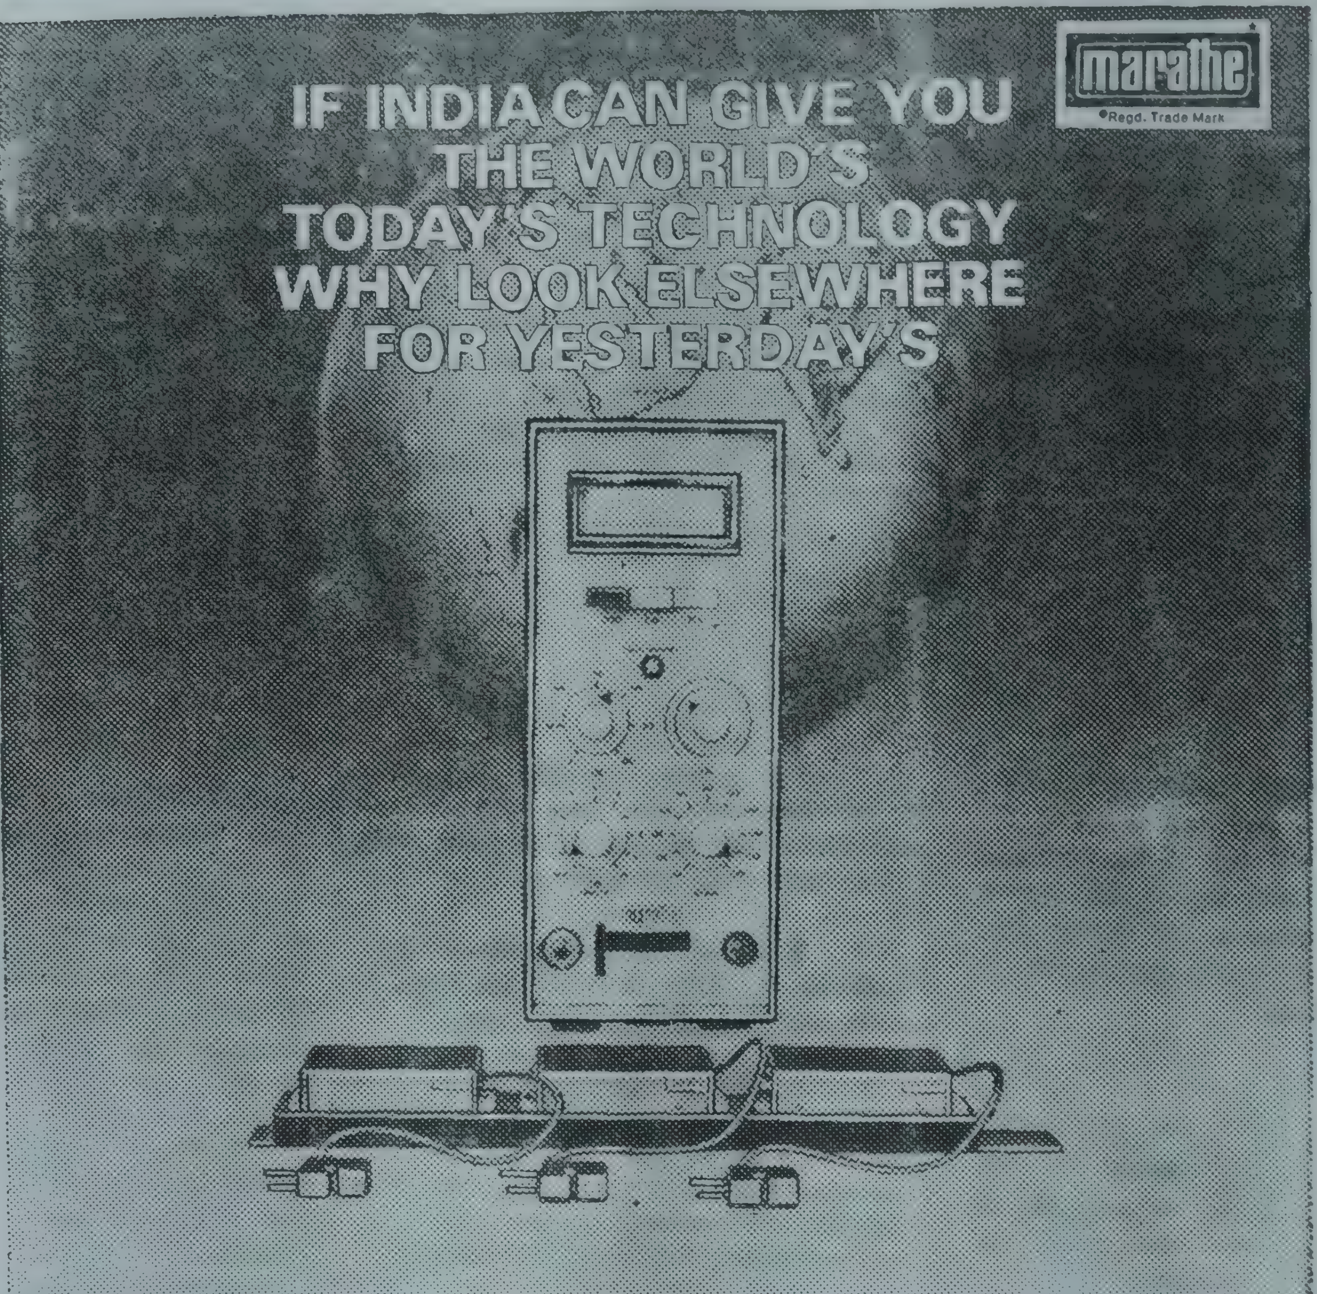
(2) *Quicent PM* 80 : In order to utilise the higher heat setting production speeds of the order of 80 to 120 metres/min on pins, the Model FS 400 is now equipped with photocell feelers in conjunction with DC variable speed feeder motor alongwith rack and pinion mechanism. The proportionate characteristic of this device enables accurate pinning within the selvedges. The entire electrical circuit is made of solid state technology avoiding frequent maintenance required to the electrical contacts in the present feeders, or attending to the carbon brushes and commutators of the DC generator in feeders of similar types.

(3) *Clips* : The twin ball bearing type Primatex clip does not need any introduction. However, it is worth nothing that, only such clips can stretch the fabric weftwise to the required width independent of warpwise shrinkage and/or elongation without leaving any cuts on the selvedges and adding to frictional losses.

When not in operation, the pin bar carrier folds inside in the direction opposite to the weftwise tension in the fabric. Hence, the chances of pin bar carrier collapsing does not arise when the fabric is stretched inadvertently while running on pins.

Since the pin bar carrier folds inside *i.e.* by 90° while not in use there is no chance of any accidental damage to the delicate pins. However, pin bars being routinely consumable the Model FS 400 incorporates clips with modified design to facilitate the change of pin bars practically in no time.

New forced atomised spray lubrication system is provided for improved lubrication. This new stenter has already been installed at New Vinod Silk Mills, Kandivli and results of actual trials have shown fuel saving to the extent of 46 per cent. In terms of money, the saving on account of fuel and power alone works out to Rs 12,00,000



MARATHE YARN CLEARER
CLEARLY AN EXAMPLE

'Today's technology' in electronic controls is in India's compound. And it is with Marathe.

Marathe Electronic Yarn Clearer. It offers a complete electronic yarn clearing system based on optoelectronic principles.

It aims at measuring the thickness and length of the yarn faults and cutting the thread at the defect. The use of infrared light system for sensing and most advanced integrated circuits for detection lead to very reliable detection and removal of unwanted thick places including smallest size neps to thick ends and spinners doubles.

The yarn clearer consists of centralized control unit, controlling amplifier–sensor unit for ten spindles and above.

All these features put Marathe Electronic Yarn Clearer on par with the best and the latest the world can give. So now you don't have to look elsewhere for a Yarn Clearer – especially not for the ones made with outdated technology.

Ribbon and sliver lap machines

A new strategy for export

By AN INDUSTRIAL CORRESPONDENT

PRODUCTION of the Indian textile machinery industry has increased significantly during the last three years, mainly as a result of a surge in demand from the domestic textile mill industry. Total production during the three year period was as under :

Years	Complete machinery (Rs. crores)	Components/ accessories (Rs. crores)	Total (Rs. crores)
1978-79	134.31	67.39	201.70
1979-80	170.00	71.58	241.58
1980-81	221.39	81.30	302.69

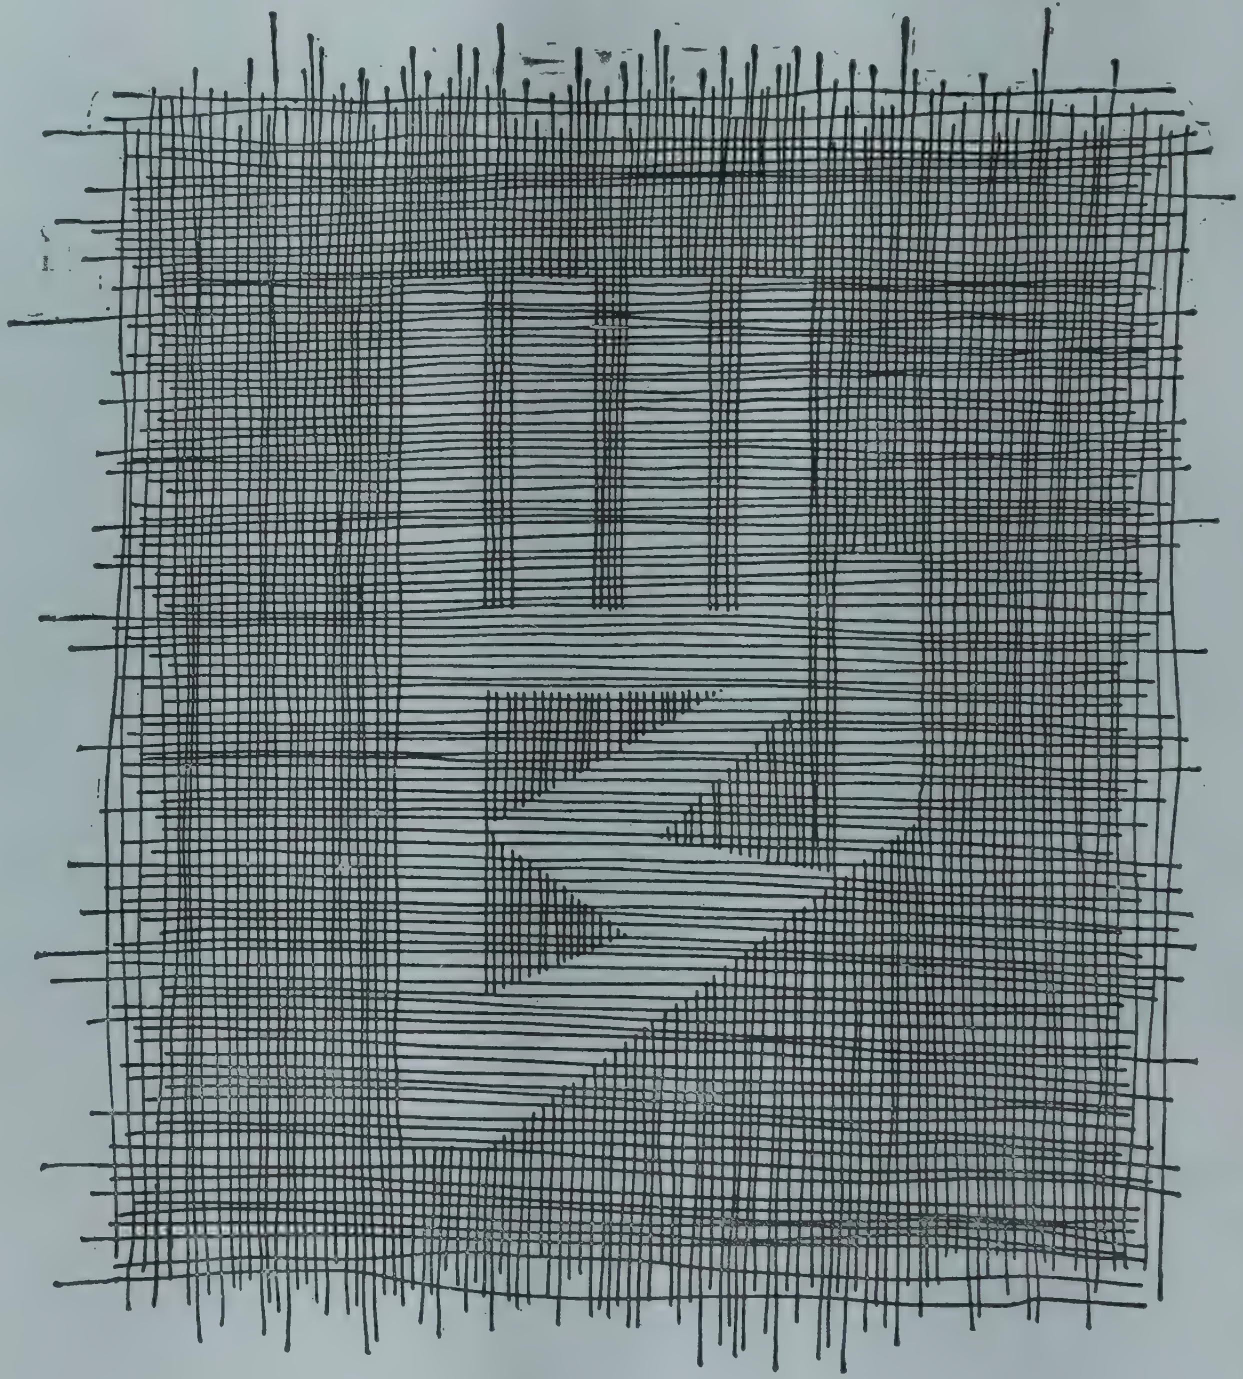
The industry is poised for a further leap forward in the next four years. Over Rs 100 crores are being spent on acquisition of new technology, modernisation of equipment, manufacture of new items, expansion of capacity, etc. An approximate break-up of the new investments will be about Rs 70 crores in spinning & spinning preparatory, about Rs 20 to 25 crores in weaving & weaving preparatory and about Rs 25 crores in processing, finishing and other types of machinery. The user industry will therefore get not only more machines but also the most modern machines with an accent on improved performance and productivity and lower running costs.

With the planned investments in the machinery industry, the total production of textile machinery components and accessories will shoot up to about Rs 460 crores by 1984-85 from the current levels of Rs 302.69.

The TMI has not only been catering fully to the requirements of the domestic textile mill industry, but has also been contributing regularly to the export market. The export performance of the industry over the last five years was as under :

Year	Rs crores
1975-76	22.79
1976-77	15.30
1977-78	10.06
1978-79	12.04
1979-80	13.50

It will be quite obvious from the above figures that though the industry's capacity to produce has increased, the export performance has declined. From a peak of Rs 22.79 crores in 1975-76, the export earnings of the industry have come down to Rs 13.50 crores in 1979-80. The textile industry, being very sensitive to market conditions suffers violent fluctuations in its fortunes from time to time and the textile machinery industry in turn, suffers from the backlash by way of ups and downs in the demand for machinery, components and accessories. A strong export base for the industry is thus not only expedient but has become



CROMPTON GREAVES
INTO THE VERY FABRIC OF THE TEXTILE INDUSTRY

Crompton Greaves expertise is woven into the very fabric of India's textile industry, playing a silent yet significant role.

From ginning, carding, spinning, weaving to dyeing and printing, the Crompton Greaves motor is there. Tailor-made to suit all applications. With a choice of electric drives, so vital to the efficient running of any textile mill.

ULKA-TE

an economic necessity. It takes time to establish the image of an industry as a regular supplier of quality goods in an export market. In an industry like textile machinery, technologies change very fast and a manufacturer-exporter has to continuously update his technology. Markets have to be studied, their preferences noted and personal contacts with the buyers built up. A regular after-sales-service must be assured to the buyer and an information system developed, to enable manufacturers to make prompt bids for export projects. All these things called for a long-term plan and a definite strategy in identifying markets and products.

Concerned with the downward trend in exports the Textile Machinery Manufacturers' Association (TMMA) appointed a Sub-Committee to study the total scenario and submit its findings. Specifically, the Committee had the following terms of reference: (a) To study the factors leading to decline in the export performance of textile machinery industry. (b) To identify markets and the products to be exported with a view to improving the overall performance of the industry. (c) To evolve a strategy for increasing the exports of textile machinery. (d) To specify the steps necessary to be taken by the manufacturers and at the Association level, to achieve the higher targets of exports set for the industry. (e) To enunciate the assistance required from the Government, Indian embassies and EEPC offices abroad.

Apart from identifying certain external factors responsible for the downward trend, the Committee did some soul-searching and came up with some interesting answers. According to the Committee's analysis, the following are some of the principal constraints faced by the Indian textile machinery manufacturers in exporting their products:

1. *Shortages*: Inadequate availability of inputs such as raw-materials, components, power, shipping space etc. In the past, execution of some of the project orders have been delayed because of these shortages, with the result the foreign buyers lost confidence in our ability to supply machinery on schedule and therefore no repeat orders came our way.

2. *After-sales-service*: Here again, against some of the orders secured by Indian machinery manufacturers in the late 60's and early 70's, some of the technical problems that cropped up with the machines were not solved in time and supplies of spares and components were also tardy. This further eroded the confidence of the foreign buyers in our exporters.

3. *Technology*: In the early stages of the industry's development, a wide gap existed between the technology offered by the Indian machinery makers and that available in the developed countries. Many of the foreign buyers therefore preferred to go in for more advanced technology offered by the European nations and Japan. Though the Indian industry in recent years has been producing machines of latest technology the initial period of backwardness lost for the industry a number of export orders.

4. *Local demand*: Unlike the foreign machinery makers who have necessarily to export over 80 per cent of their production for sheer survival, the Indian textile machinery industry has no such compulsion to export because almost 90 per cent of its production is grabbed by the gigantic domestic textile industry. During the last three years, with the availability of the 'soft loan' and the improved market conditions, the Indian textile industry launched upon a massive programme of modernisation and acquisition of new machinery. This has put tremendous pressure on the indigenous textile machinery makers and many of them were booked for a period of 18 to 24 months and some even longer. Virtually no special effort was therefore made by manufacturers to tap new export markets.

The Committee has recommended adoption of a new strategy to effect a breakthrough in the export market and increase the industry's export earnings from Rs 18 crores at present to Rs 40 crores by 1985. The following are the principal elements of this strategy.

1. Manufacturers who accept export as an essential obligation should set apart a certain percentage of their production for exports.

2. Where feasible, 100 per cent export oriented units should be set up.

3. Warehouse-cum-spare-parts depots must be established in different parts of world where the industry has the maximum export potential. This will ensure quick and efficient after-sales-service. Besides, Indian manufacturers should either train the staff of agents or keep their own service engineers in the agents' territories.

4. Indian entrepreneurs should be encouraged to take up joint textile mill projects in third countries so that Indian capital equipment could be exported against Indian equity participation.

5. Where Indian manufacturers are not able to get full textile mill projects they could tie-up with companies in third countries for either a part of the project or supply of individual items of machinery or services.

6. In addition to export of machinery, accessories and components, a greater thrust should also be given to the export of utility equipment such as air-conditioners and humidification plants, fire-fighting equipment, boilers, water treatment plants and electrical equipment. In the case of turnkey projects, the machinery makers could also increase foreign exchange earnings by way of undertaking building construction for the textile mills, housing colonies and other infrastructural facilities. They can also export technical and skilled man-power and management services for such projects.

Taking into consideration various factors both national and international, the Committee has recommended following export targets for the industry:

Year	Rs. crores
1981-82	25
1982-83	30
1983-84	35
1984-85	40

The Committee while admitting that a deeper study will be necessary to assess the potential of each market, has nevertheless pinpointed most promising areas for undertaking a vigorous export drive:

	Percentage of target Fixed (Approximately) (%)
Neighbouring countries like Pakistan, Bangladesh. Sri Lanka & Burma —	20
East African countries like Kenya, Tanzania, Zambia, Uganda —	10
North African countries like Nigeria, Ghana, Zimbabwe, Cameroon, Gabon. —	10
West Asian countries like Iran, Iraq, Syria & Turkey —	10
South East Asian countries like Indonesia, South Korea, Thailand, Vietnam, Malaysia, Philippines. Taiwan, Singapore, Laos. —	20
East European countries like Poland, Bulgaria, G. D. R. & Hungary, Rumania, Czechoslovakia, Russia & Yugoslava. —	10
Developed countries —	5
Other countries including Latin American countries and China —	5
	100

In conclusion, while fixing export targets, which are quite modest and well within the reach of the industry, is a mechanical exercise, the biggest gain that has resulted from the work of the Committee is the realisation on the part of the industry that export has to be cultivated consciously as a culture and not merely be a hit and run affair. If some of the infrastructural constraints are removed and also additional export assistance is given by the Government, there is no reason why the export performance of the industry should not exceed the targets the industry has set for itself.

NSE - INGOLSTADT present
Blow Room to Ring Frame
Bale opening to Fine Spinning
A complete spinning mill package
from NSE in collaboration
with SCHUBERT & SALZER Maschinenfabrik Aktiengesellschaft INGOLSTADT

1

Improved yarn quality and saving in mill operation

By S. J. CHANDIRAMANI

FOR weaving of cloth, yarn must be suitably prepared. Unless preliminary operations are carried out efficiently, weave-room is bound to suffer. Yarn is prepared for the manufacture of cloth on what is known as winding and warping machines. Barber-Colman is one of the most efficient winding and warping machines that prepare yarn to run efficiently and to give best possible production results in the weaving room. Development of Barber-Colman automatic winding and warping system has practically eliminated human elements. Operators of spooler are required only to place bobbins in position to be handled by the automatic mechanisms; and to remove full package. Machines are, therefore, not subject to such human characteristics as fatigue, carelessness, indifference or errors that are frequently found on manually operated machines. Operations performed by the workers on the machines are extremely simple. Work is of high quality, with only reasonable supervision required, and such production is continuous at great reduction in cost.

In most cases, it is desirable to break out gouts, bad piece-ups, thick places and wild yarn which may later cause loom stoppage or defects in the cloth. Barber-Colman automatic spoolers are equipped with automatic cleaning devices known as snick plates. These snick plates remove foreign matter and imperfections without injury to the yarn. Their efficiency is highly regarded where production of quality yarn is required. Constant improvement in the design of this unit has assured maximum efficiency in removing undesirable matter.

Loom beams from Barber-Colman warpers weave with less breakages than those from ordinary beams. Low, uniform tension on the yarn provides equal stretch to all strands and preserves elasticity for better strength to stand the loan at the loom. Less breakages of the warper results in better work of the slasher and straighter warps at the loom. High quality yarn, mechanically-tied weaver knots, elimination of spooler kinks and removel of imperfections combine to reduce loom stops and seconds in the cloth room.

Mr Chandiramani is manager, Textiles Department, Batliboi & Company Ltd.

To facilitate handing the yarn from spooler to warper without damage, a cheese carrier is used. The cheeses, handled on tridents, are much less liable to injury than by other methods where spools may be thrown into boxes or roughly handled damaging the yarn.

There is minimum tension on yarn handled by Barber-Colman system of spooling and warping. On the spooler, no tension is applied to the running thread except that which is caused in winding off from the bobbin and from air friction. No tension is applied to the yarn on warper except that created as the yarn comes off the cheeses overend. Air is the only element that adds friction, and this provides uniform tension equally to all running threads resulting in superior beams. As a result of minimum uniform tension the strength and life of yarn are fully preserved for the loom.

The advantage of weaver's knots and their importance in processes following spooling are generally recognised throughout the textile industry. More uniform distribution of mass of the knot around the yarn, less bulk and decreased tendency to slip, allow the weaver's knot to pass more readily through harness eyes and reed dents. The result is fewer stops. This type of knot also passes more freely through the eyes of needles when the yarn is used in knitting machines. Knots with short ends bury themselves more completely in cloth than those having long ends. Long ends on knots frequently cause many loom stops due to tangling with adjacent threads. This is especially true on certain classes of work such as leno weaves. The present weaver's knotter is standard equipment on automatic spoolers. It ties knots with short ends, is entirely mechanical and is not subject to the variations found in hand-operated knotters.

INTERVIEW

Industry's prospects bright in 80s and beyond says Suresh Mehta

In a tete-a-tete with Mr Leon Lobo of Commerce, Mr Suresh Mehta, chairman, Star Group of Companies and former chairman respectively of the Textile Machinery Manufacturers' Association (India) and the Engineering Export Promotion Council, painted an optimistic picture of the textile machinery industry on a wide canvas at the same time making no bones about what would have to be done by both industry and government if the targets set for production and exports were to be met.

(1) *Unqualified success though it was, what lessons has India-ITME 80 imparted to Indian textile machinery manufacturers? What directions will the industry take as a result-in R & D, production and export?*

More than 1,000 different textile machinery exhibits were displayed by 106 Indian and 18 foreign participants in an area of about 6,200 sq mtrs floor space in three different Halls in India Itme 80. The exhibition brought out a number of new developments, designs, technologies and machines displayed for the first time under a single roof. While the exhibition brought home the need to reduce the technological gap between Indian manufacturers and their foreign counterparts, it showed that technologically even the small and hitherto less known manufacturers had made substantial advances so as to hold their heads high in an international exhibition and received large Indian and foreign enquiries and orders. The user industries especially the cotton textile industry, was also able to see the significant advances made by Indian industry and gained greater appreciation of the production capability of Indian industry to meet its requirements. The exhibition has given a further stimulus to greater R & D efforts by Indian manufacturers which, I am sure, has been given a great fillip and simultaneously larger number of technological tie-ups with foreign manufacturers having advanced technology on a selective basis.

(2) *Since you were the Chairman, Steering Committee, looking back, what were the short-comings of the fair (1) organisational (2) otherwise and how would you endeavour to overcome these in future?*

The approach of the Steering Committee of India-Itme 80 was professional and the exhibition was largely functional so that it could operate as an instrument to generate larger sales of textile machinery and components at home and abroad.With the rigid time limit of about two months all that was humanly possible was done to make the exhibition a great success. The major lesson to be drawn was the imperative need for a large and permanent exhibitions complex at Bombay which is the industrial, commercial and financial capital of the country so that more time is devoted to enlist significantly larger participation both by Indian and foreign manufacturers. It also showed what a colossal loss of scarce resources is involved in putting up magnificient pavilions and stalls and other infrastructural facilities at great cost and pulling them down within a short spell of time at the end of the exhibition.

(3) *You would recall that you had told newsmen at the time that efforts were being made to retain Bandra Reclamation Ground as a permanent exhibition site, considering the enormous effort and expense that went into setting up India-ITME 80. Have these fructified? If not why? What alternative plans have you made for the next India-ITME? Have you been offered an alternative site for a permanent exhibition centre on the lines of Pragati Maidan, New Delhi. One would imagine that Bandra, from all angles, offered the best scope.*

Notwithstanding the strenuous efforts made by the organisers of India-Itme '80 and spokesmen of the Central Government, it was not possible to retain the structures and the facilities created for India-Itme '80 at Bandra Reclamation Grounds, Bombay, on a semi-permanent basis until a permanent exhibitions complex is created at Bombay. The outstanding success of India-Itme '80 has stimulated major industries and their associations in Bombay to join hands with the India-Itme Society for undertaking the setting up of a large and well-equipped permanent exhibitions complex at a suitable site in Bombay to serve the requirements of exhibitions at Bombay for all industries. We are very hopeful of getting a suitable site, and spokesmen of other major industries such as engineering, machine tools, clothing, agree with the India-Itme Society that the permanent exhibitions complex should be so planned and executed that it would not only meet the requirements of today but it should be adequate for the requirements of 1999.

(4) *What are your projections for the next India-ITME? Will you also organise a technical congress as you did last time?*

The Steering Committee of India-Itme Society has decided to hold the next India-Itme at Bombay in the second half of November 1984. This commitment stands unchanged and I am hopeful that by then the first stage of the permanent exhibitions complex, constructed.

(5) *Coming to the textile machinery scene, both domestic and international what are the current trends? How does the textile situation in both areas influence the demand for machinery. What effect has inflation and raw material inadequacy had on production and sales?*

The fortunes of the textile machinery industry are closely linked with those of the textile industries in general and the cotton textile industry in particular. The cotton textile industry enjoyed relatively favourable climate in terms of demand at home and abroad during the past three years, and this in turn, helped to maintain an expanding demand for the products of the Indian textile machinery industry. So far as the international picture is concerned, the relative overall recession in demand continues further, but there has been a strong revival of demand in select countries for textile machinery since the beginning of this year. The Indian textile mill industry is currently facing difficulties in terms of consumer resistance to increase in prices and escalation of costs, especially, prices of raw cotton which constitutes the bulk of the unit cost of production. Besides, fuel costs and electricity cuts are adversely affecting the cost-economics particularly of yarn production. It is, however, hoped that appropriate steps would be taken by the Government to sort out the difficulties of the textile industry which is the largest and the oldest industry of the country. In common with other industries, the growth and the expansion of production of the textile machinery industry suffer from substantive escalation in the costs of raw materials, besides foreign exchange fluctuations of the value of the Indian rupee in terms of the US dollar and the appreciation of the US dollar in terms of the major Western European currencies.

(6) *How much has mill modernisation under the IDBI's soft loan scheme helped machinery manufacturers in India? What are the drawbacks of the scheme, if any?*

The Soft Loan Scheme of the IDBI has been the most important single factor in greatly increasing the demand for the indigenous textile machinery, components and parts. There is a huge backlog of modernisation of the textile mill industry yet to be carried out and it is essential that the Scheme is continued and the annual level of disbursement of loans is maintained at Rs 250 crores so that the modernisation is completed quickly and a stable demand is maintained for the products of the textile machinery industry which would be encouraged to undertake the neglected investment in expansion of capacity and modernisation of existing equipment. The principal limitations are the uncertainty as to how long the scheme would continue and Government should unequivocally announce that the Scheme would continue atleast during the entire Sixth Plan period.

(7) *What developments do you forsee for Indian textile machinery during the decade of the eighties? What about the international scene?*

(9) *What about exports of textile machinery? Will they grow during the eighties? What new markets can we expect? What strategies should be adopt?*

(10) *What about export of consultancy services and turn-key projects? We have made a beginning; where will this lead? What are the prospects—Short-term as well as long-term?*

In my view, the textile machinery industry is poised for tremendous expansion of production and a significant increase in exports abroad during the 80s. The total production of textile machinery, components and accessories reached the level of Rs 241 croses in 1979-80. The textile machinery industry has set a target of the expansion of production of machinery and components of Rs 460 crores by 1984-85. Given assured availability of raw materials, spare parts and power supplies, there is no reason why this level should not be achieved by the end of the Sixth Plan. The textile machinery exports had reached Rs 22.79 crores in 1975-76 but due to internal and international factors, the total exports tended to decline in the three years ending 1978-79. Provisional figures show that total exports would reach about Rs 19 crores in 1980-81. The Textile Machinery Manufacturers' Association (India) has set a target of exports of Rs 20 crores for 1981-82, but I consider this target to be very low. The current year's target should be raised atleast to Rs 25 crores and preferably to Rs 30 crores. As chairman of the Textile Machinery Panel of EEPC, we have begun an exercise of intensive consultation and analysis to increase the export targets for the forthcoming years not only with the TMMA & AMMTMS, but also with prominent merchant exporters, project exporters and consultancy organisations. I am confident that the export contribution of our industry including non-textile machinery exports and consultancy and services exports, can be raised to Rs 40 or even Rs 50 crores for the next year and up to Rs 100 crores by 1984-85.

There is reason to believe exports would continue to grow on a diversified basis during the 80s. The principal markets for Indian textile machinery and components are the developing countries of South-East Asia, Africa, Latin America and some of the East European countries. Pakistan, Bangladesh, Ceylon, Egypt, Tanzania, Sudan, Nigeria, Ghana, Iran, Iraq, Turkey, Indonesia, South Korea, Malaysia, Philippines provide considerable scope for exports of Indian machinery, consultancy services and management contract services for a number of reasons. Climatically, these countries have conditions similar to those in India and they also face difficulties of power supply, coal supply, fuel supply and inadequacy of trained and skilled labour force. Indian machinery which has proved the test of time under difficulties of this kind would be more suitable to the stage of economic development and the available local skills than highly advanced, sophisticated, automative machines of advanced countries. Moreover, these countries require training of the personnel in different fields of textile engineering. They also require trained managers to modernise their existing textile units, rehabilitate them with new equipment and commission and operate them for a reasonable period of time until their own personnel are able to take over. Many of the large textile machinery manufacturing units and textile companies, including companies having consultancy, management and development services are in a position to provide these requirements of the development countries. There is also considerable scope for expanding our exports to advanced countries such as West Germany, France, etc.

(8) *Do you favour more rigorous basic R & D by Indian manufacturers or judicious collaborations to induct high level technology or a favourable blend of the two? If the latter, who will define areas of R & D so that there is no overlapping?*

There is a very large scope for establishing in-house research & development centres by Indian textile machinery manufacturers and this must be done. In the end effect, research suitable for our own needs and suited to our conditions, can only be done by us and not by others. Jute is a case in point. You cannot expect other countries which do not produce jute to carry out research in jute processing or jute machinery. In my opinon, both our user and machinery making industries have so far paid scant respect to R & D with a few significant exceptions. This being said, it is pointless in the textile machinery field as an other industrial fields, to waste resources in developing advanced technologies which have already been proved and operated by advanced countries.

In such cases, it is economical and practical to negotiate technical collaboration agreements with suitable foreign manufacturers and then indigenous R & D effort should be directed to adapt the imported technologies and machines to local conditions and to develop prototypes of improved designs. The decision on where to draw the line between imports of technology and corresponding indigenous R & D effort is a matter which must be the responsibility of the manufacturer concerned and to my mind, the only basis can be the cost economic evaluation of carrying out indigenous R & D in terms of both money spent and time required *vis-a-vis* the cost of importing technology, taking also into account the indirect factor of likely dependence for ever on foreigners in this important area. Outside agencies which do not know the latest advances made by particular R & D centres would not be in a position to take decisions in the matter. Moreover, technology is changing so fast that the upgradation of the technology with a view to narrowing the gap should be decided by knowledgeable people directly in charge of the industry and not by outside agencies.

(11) *What do you expect from the government in the shape of policies and incentives to make a success of your export efforts?*

The Government of India in the Union Commerce Ministry are fully seized of the vital importance of stepping up exports and are anxious to examine the difficulties and problems and to provide necessary help to overcome the limitations. The export effort has to be a continuous process, and it cannot be a switch-on and switch-off kind of operation because regular delivery of supplies of acceptable quality is indispensable for building up and maintaining confidence of foreign buyers in Indian manufacturers as reliable suppliers of these products. If there is an interruption of supplies even for a short period, well-nursed markets may be lost for ever. Against this perspective, the export effort or strategy of the country cannot be divorced from or formulated in isolation of the production strategy of the country. A sustained export effort requires expansion of export production capacity so that genuine export surpluses are created and assured supplies of infrastructural and basic inputs including shipping. These are matters which involve consideration by and decisions of more than one Ministry and that is why delays occur in the formulation and announcement of policies and their implementation at the cost of expanded production and increased exports abroad.

(12) *What are your prognostications for the textile machinery industry as a whole in India and world-wide in th context of textile trends both current and anticipated.*

Clothing is a basic and primary need of individuals — men, women and children — all the world over. Given th growth rate of populations, the demand for clothing woul continue to rise from year to year. Man-made fabrics, artificial fabrics certainly have greater appeal to consumers an man-made fabrics would continue to play a significant role i meeting the clothing requirements of world populations. Tha being said, cotton would continue to hold the field as th major material to meet the clothing requirements because o durability and climatic conditions in different parts of th world. From a long-term point of view, the prospects for th textile industry and the textile mill industry in India and developing countries of the world are bright. However, the sharp hikes in crude oil prices by the OPEC countries have dislocated economies of both the advanced and the developing countries and set in motion an era of continued inflationary pressures, cost and price increases and foreign exchange fluctuations.

These factors have produced stagflation in economies o many advanced countries with adverse reactions on the world demand and encouraged protectionist tendencies. As a result, there are fluctuations in the world-wide demand for textiles and textile machinery products. However, 1981 has ushered in hopes of revival of world demand and containing of inflation and if these favourable trends continue, the prospects for both the Indian cotton textile industry and the cotton machinery industry are bright during the 80s. So far as the textile machinery industry is concerned, three factors, Government's textile policy with emphasis on expansion of spinning capacity, import policy to permit imports of critical spares and the Soft Loan Scheme of the IDBI, provide a strong base for increase in investment, expansion of production including modernisation and up-grading of technology to meet the requirements of machines and components of our mill industry and the expected increase of the textile mill industry in the developing countries

Conservation of electricity in textile industry

By **A. V. WAGLE**

THE textile industry which is one of the largest and oldest industries in India has been passing through crisis on account of uneconomic working due to outdated production techniques and equipments. Fortunately the government as well as private owned textile groups are aware of the need for modernisation and steps in this direction are underway.

The power and utility play a vital role in running the wheels of textile and other related sectors. In the past the power and utility cost of textile sector was only 3-4 per cent of total cost structure, but due to recent price hike of coal and fuel oil, this cost has gone upto 8-10 per cent. The electrical tariffs are expected to go up further and are likely to double in the next few years.

Indian textile mills are facing stiff competition about their products, qualities and products costs in India as well as in the export market. This additional increase in power and utility cost has compelled them to relook at their machinery and system which consume power. Concern for making efficient use of our valuable energy resources is now of critical importance in conserving them.

Energy conservation—scope in a textile mill

There are two major sources of energy used in a textile mill *i.e.* Electrical energy and Steam energy derived from electricity, oil and/or coal.

Industries account for about 70 per cent of electricity used in India. It is used for motive power *i.e.* motors, for heating and melting, for illumination and for electrolysis. In the textile sector electrical motors consume 90-95 per cent of the total electric power, while the rest is shared by illuminating load, resistive load etc. There is a very great scope for reduction of electricity consumption without affecting the level of production.

Energy factors in the selection of electric motors

Choosing a motor most suitable for a particular application is based on many factors, including the requirements of the driven equipments, service conditions, motor efficiency and motor power factor. Good energy management is the application of the motor and its components that results in the least consumption of energy.

Motor efficiency : Motor efficiency is a measure of the effectiveness with which a motor converts electrical energy into mechanical energy to perform work. It is defined as the ratio of power output to power input or in terms of electrical power, watts output to watts output plus watts losses. Watts losses are electrical energy that is not converted into useful mechanical energy, but is transformed into heat and dissipated through the motor frame. Watts losses represent electrical losses, friction and windage.

Thus, motor efficiency is a function of watts losses. The lower the watts losses of a given motor, the higher the efficiency. Even in higher horsepower motors that typically have higher efficiency percentages than lower horsepower motors, watts losses are significant and cannot be ignored.

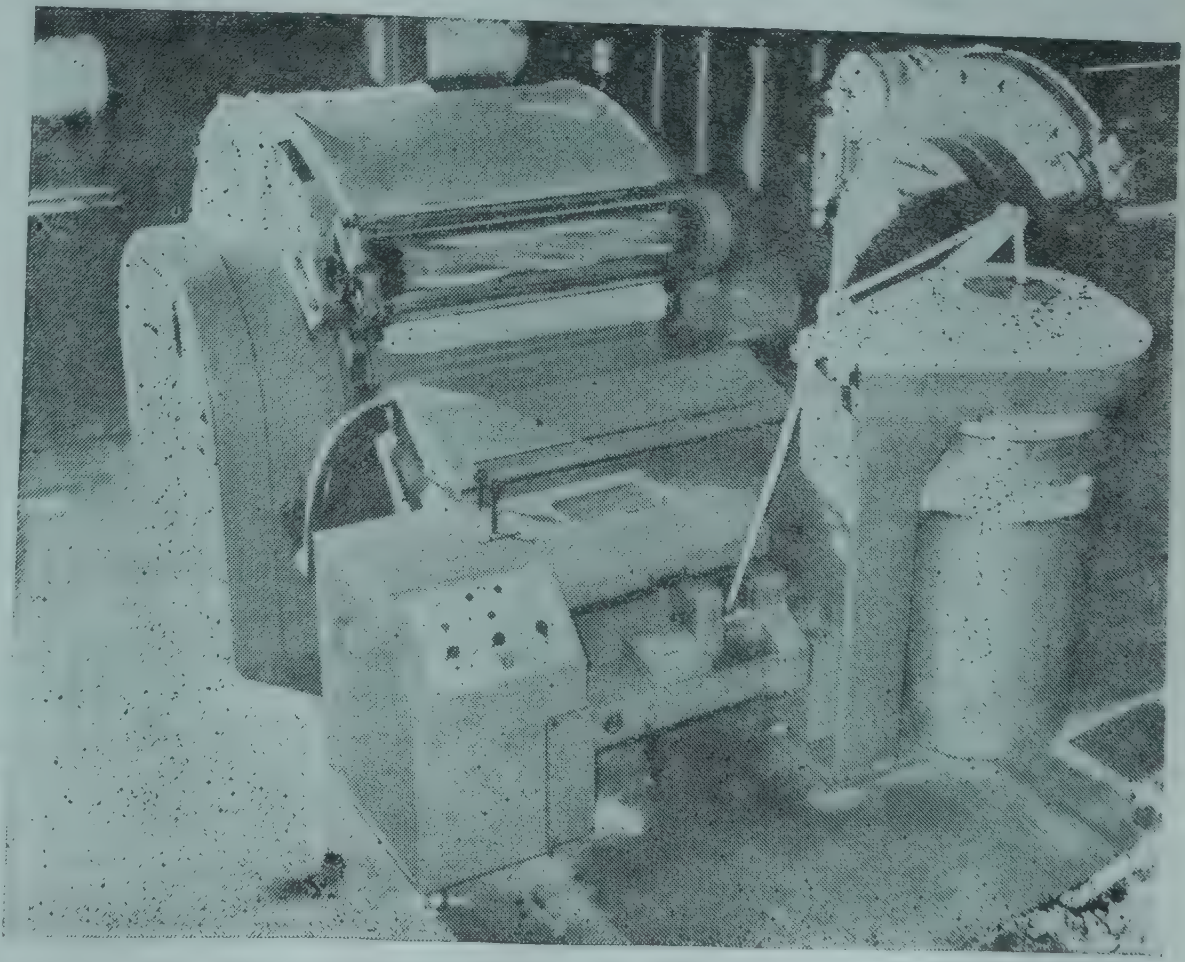
Every AC motor has five components of watts losses that contribute to motor inefficiency : 1) Iron, 2) stator $I^2 r$, 3) rotor $I^2 r$; 4) Friction and windage and 5) stray load loss. The losses are associated with three common elements of motor construction : 1) losses in the circuits which carry current ($I^2 r$ losses); 2) losses in the circuits that carry magnetic flux (Iron) and 3) losses in those parts which help support and ventilate or cool motor parts (friction and windage loss). Stray load losses can occur in any or all these elements.

Improvement in motor efficiency is the result of reducing watt losses. Simply stated :

Reduced losses—Improved efficiency

In terms of existing state of electric motor technology, a reduction in watts losses can be in various ways. (1) Increasing the cross-sectional area of the winding using a greater number of conductors, or large conductor cross section, increasing slot fill and reducing stator $I^2 r$ losses; (2) Adding more core steel, to reduce operating flux density; (3) Utilise low loss, core steel for stator and rotor laminations to improve magnetic properties; (4) Using low-loss motor cooling fans to reduce windage losses.

All of these changes to reduce watts loss also possible with existing motor design and manufacturing technology. They do, however, require additional materials and for the use of higher quality materials resulting in increased motor cost.

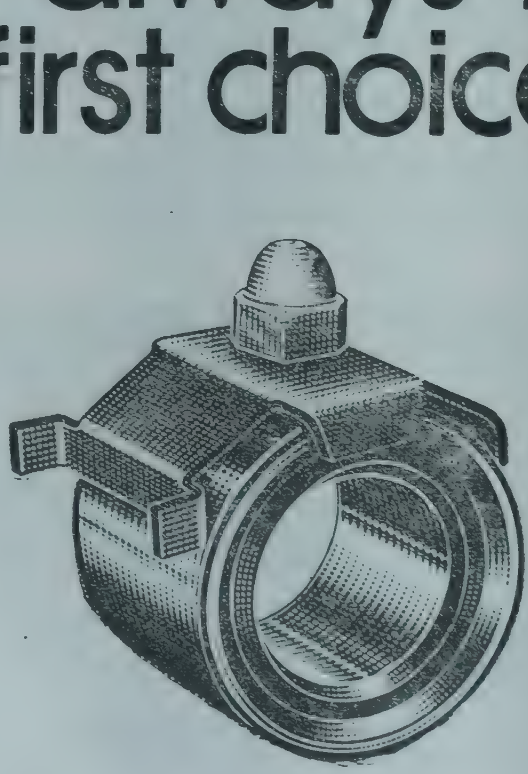


High production card

Mr Wagle is chief design engineer, Crompton Greaves Ltd, Bombay.

When the most reputed textile machinery manufacturers select bottom roller bearings

KCI, is almost always their first choice.



In fact, nine out of ten bottom roller bearings in use today are branded KCI. Simply because the most reputed textile machinery manufacturers know they can depend on KCI quality and performance. The same holds true even for replacements. Among textile mills, KCI is once again the first choice.

The reason ofcourse is quite obvious. The best technology and rigid quality control goes into every bearing. With prompt after-sales service, an ever-ready standby.

KCI...Where reliability is a tradition.

Power factor and energy costs : An induction motor uses both actual (real power KW) and reactive power (reactive KVAR). Real Power-KW runs the motor and results in useful work. Reactive KVAR performs no useful work, but oscillates back and forth between the motor and the utility's generators. Together they form total KVA : Power factor is the ratio of real power-KW to total KVA and is directly affected by the reactive KVAR.

Industrial power costs are determined on the basis of three energy components : Real power — KW costs; power factor penalties and demand charges.

Real power : Real power-KW is measured by a watt-hour meter and is billed at a given rate (Rs/KWH) by the utility. The quantity of real power consumed depends on the total watts converted by the motor from electrical energy into mechanical and the energy lost in this process due to motor's inefficiency.

Power factor penalties : Power factor is the ratio of real power-KW to total KVA. Total KVA is the vector sum of real Power-KW and reactive KVAR. Although reactive KVAR performs no work, an electric utility must maintain an electrical distribution system to accommodate this additional electrical energy. A utility will often pass this cost on to customers in the form of a penalty when power factor fall below a certain value.

Demand charges : The third energy component is a demand charge based on the peak or maximum power consumed or demanded by an industrial customer during a specific time interval. Because peak power demands may require an electric utility to increase generation capacity a penalty is assessed when demand exceeds a certain level. This power demand is measured by a demand meter and is usually assessed as a multiplier to the Real Power-KW consumed.

Power factors in industrial plants are usually low due to the inductive or reactive nature of induction motors, transformers, lighting and certain other industrial process equipment. Low power factor is costly. Low power factor also reduces the amount of real power that a plant electrical distribution system can handle. Low power factor increases line currents that will increase losses in a plant's distribution system.

Power factor can be improved through the use of synchronous motors in the power system or by the use of properly sized power factor correction capacitors. These corrective measures offset or reduce the KVAR — reactive component.

Just as the efficiency of any induction motor is reduced as its load decreases, the same is true for the power factor only at a faster rate of decline.

Factors affecting efficiency of induction motors

How do system parameters and motor characteristics relate to the efficiency at which a motor operates ?

Voltage and frequency operation at other than rated voltage and frequency may decrease efficiency and adversely affect other performance characteristics. The precise effect depends on the individual motor design. Table 1 indicates the effect of voltage and frequency variation on the performance of the motor.

Voltage unbalance — A balanced 3 — phase supply is essential to efficient operation. A voltage unbalance of 3.5 per cent can increase the motor losses by about 20 per cent. Care must be exercised threfore, to allocate loads equally when taking single-phase loads from a 3-phase supply.

Load — Motor efficiency changes as the load changes. Operation at loads substantially different from rated load may also result in a change in efficiency (Fig. 1).

Horsepower — The efficiency of a motor operating at rated load increases as the motor horsepower rating increases. High HP motors are more efficient.

Speed — For the same horse power rating, motors with higher speed generally have a higher efficiency at rated load than motors with lower rated speeds. Table 2 compares 5 HP motors as to performance at various speeds.

This does not mean that it is wise to use a high-speed motor and then use pulleys and gears or other speed changing mechanisms to produce the speed required by the load. The additional power losses could reduce the system efficiency to a value lower than that obtained by a direct drive, lower-speed motor.

Slip — Slip is a measure of the losses in the rotor winding of a polyphase induction motor. Therefore, the higher the slip, the lower the efficiency. For applications involving pulsating inertia loads, such as punch press or oil well pumping, the overall efficiency of motors with high slip may be higher than that of motors having a slip of less than 5 per cent. High-slip motors may be necessary for applications requiring high starting torque.

Multi-speed designs — The efficiency of a multispeed motor at each operating speed is somewhat lower than that of a single-speed motor having a comparable rating. Single winding multi-speed motors are generally more efficient than two winding multispeed motors, and it may be possible to make a significant saving in energy by operating on low speed whenever possible and using high speed only when necessary.

Duty cycle — Motors that operate continuously and for long periods of time provide energy reducing opportunities. A small change in motor efficiency will make a significant change in total energy consumed. Examples are pumps, fans, blowers etc.

Selection of motors for energy conservation

High efficiency motors—In the recent past, users of electric motors have considered other factors such as size, weight and various operating characteristics as being far more important than the efficiency of the motor. At the same time, the motor's first cost was considered more important than its lifetime operating (power consumption) costs. However, with the rise in the power rates, cost evaluation is focussing more attention on motor operating efficiency. At present, running cost of a motor even for a year is much more than the initial capital cost of the motor. As energy costs continue to escalate rapidly, it becomes profitable for users to evaluate motor on a life cycle cost basis (*i.e.* initial cost and operating cost). With high energy costs it is profitable to pay higher initial cost for a premium efficiency motor and reap the saving in energy cost for differences during the life of the motor.

The impact of motor efficiency on operating costs is highlighted in Table 3 for 20 HP motor driving a ring frame in a textile mill.

Type of motor—Selecting "high efficiency" motors is not always the only answer to lowering watts losses and achieving higher efficiency. Many times, a rather simple upgrading of the motor type from a single phase split phase to a single phase, capacitor start capacitor run can improve efficiency. Where power supply permits, changing from a single phase to a three phase improves efficiency and reduces watts loss.

Motor rating—One of the most common source of increased motor watt loss is the result of a motor not being properly matched to its load. The use of motors having an output rating greater than the load requires, can cause a reduction in operating efficiency and in the system power factor (Fig. 1) that results in added losses in the distribution system. In application where motors

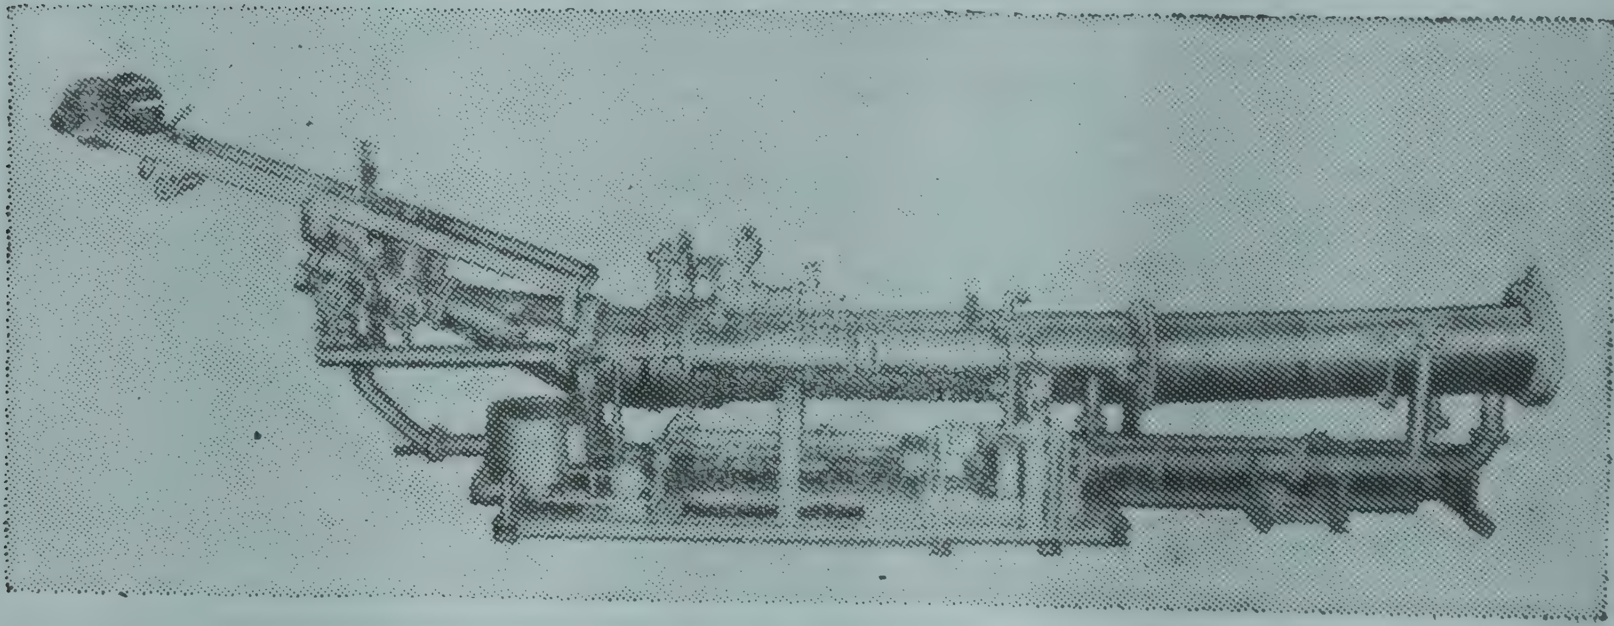
Jet your fabrics into a new age!

STAR-HISAKA
RAPID JET DYEING



The world's most advanced Rapid Jet Dyeing Plant that completely outdates every other machine.

The Star-Hisaka Rapid Jet Dyeing models CUT F/FL – India's 3rd generation machines, outdate every other machine and set fantastic new standards in speed, production, economy, versatility and never before dyeing excellance.

Some of the revolutionary features:

- Reduced Dyeing Cycle – only 60 minutes irrespective of fabric type.
- 12 to 14 batches guaranteed per three shifts.
- Low Dye liquor ratio – 1:6 to 1:8, depending on fabric type.
- Universal application – Georgettes to Heavy Corduroys (40 to 600 gms/linear metre)
- No anti-creasing, defoaming, levelling or dispersing agents or carriers required.

run idle for an extended period of time at no load, energy could be saved by shutting down the motor and restarting it at the next load period.

Table 4 shows three different alternatives. In first case a correct HP motor is operating on a spinning frame and is loaded to 10 HP. In second case the same machine is driven by a 15 HP motor which is loaded to 2/3 load (*i.e.* 10 HP) and in the third case 20 HP motor is loaded to ½ load.

Special motors for textile industry

Special motors are required for textile industry basically on account of three factors: (1) Special environmental, (2) operating and (3) drive conditions.

Using a standard motor in such cases would only result in unsatisfactory performance, more energy losses, reduced life and greater hazard. The present day trend is therefore to use specially designed motors for textile industry. Table 5 summarises the special features of motors for textile industry.

The following Indian standards on motors for various textile applications are given here as guidelines for motor selections.

IS 2972	Part I	Loom motors
IS 2972	Part II	Card motors
IS 2972	Part III	Ring frame motors

'Clean flow' construction

Normally considerable amount of cotton fluff is present in textile mills. The fluff has a tendency to accumulate on the fan cover grids as well as in the ventilation passage. Accumulation of fluff leads to restriction in motor ventilation, which results in increase in motor heating and motor losses and ultimately burning out of the winding. TEFC Motors with 'clean flow' construction (Fig 2) are suitable for applications such as spinning, doubling, ring frame, draw frame, fly frame, speed frame etc where a moderate amount of fluff is present. Table 6 compares the energy consumption and insulation life of standard motor v/s. Motor with clean flow construction driving a ring frame.

Motor for pump application

Pumps are important components in most industrial installations and even relatively small energy savings per pump will mount up on an industry and national basis.

Most pump drives have fixed-speed electric motors and the volume of liquid is controlled by valves or by on-off control of the pumps. These crude control methods are often very wasteful, since much of the energy is used to work

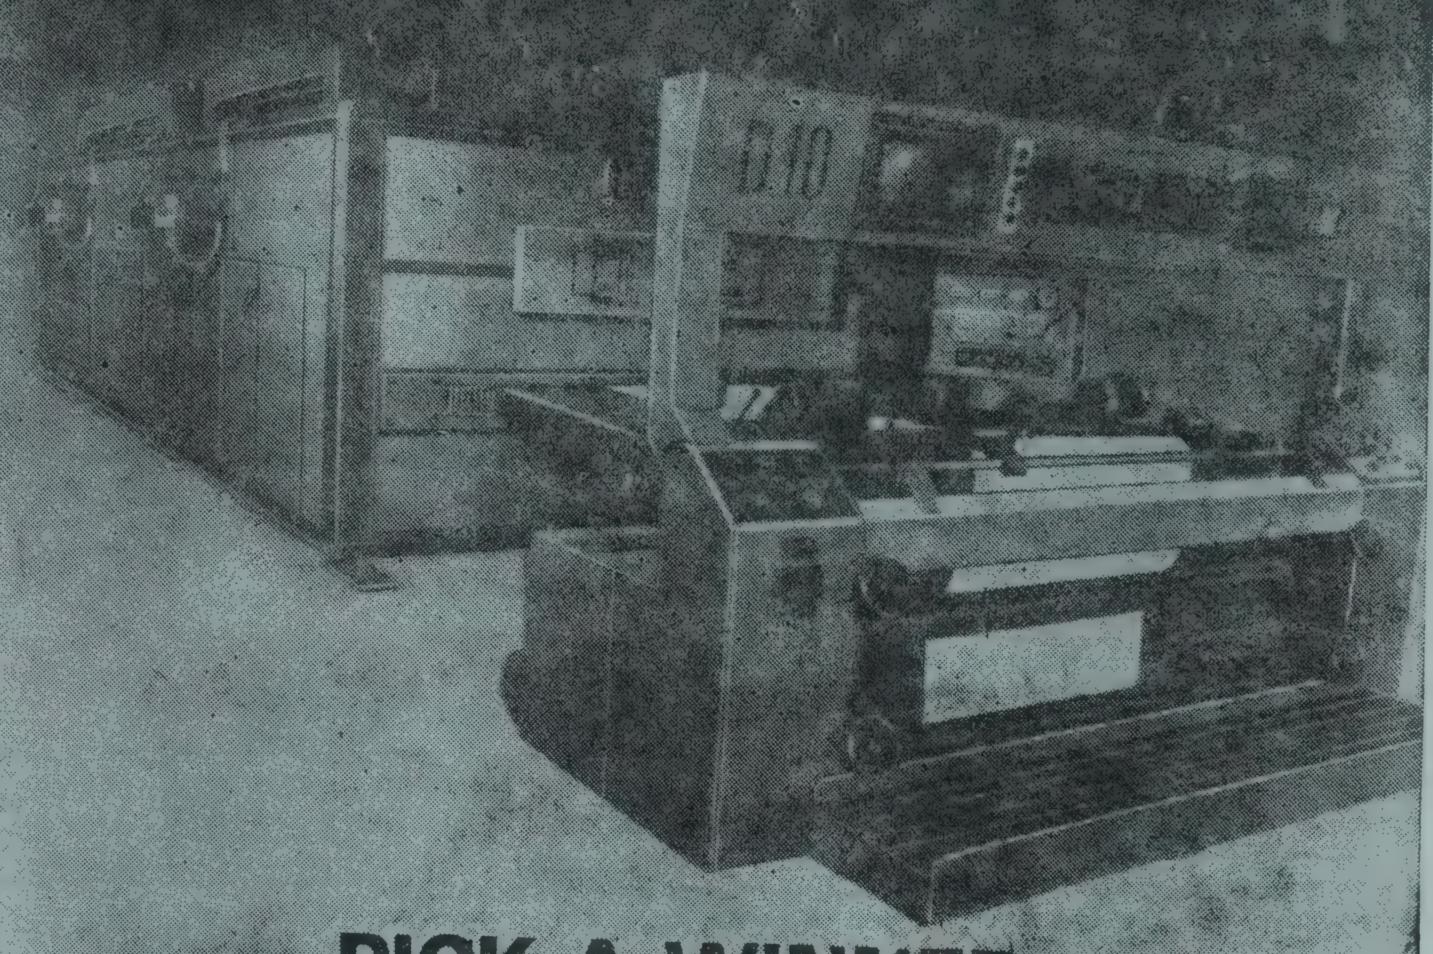
HARISH D10
THE ELECTRONIC STENTER



PICK A WINNER

The Harish D 10 is a modular unit of Harish stenters incorporating the latest in technology and specifically the '2 × 2' counterflow system.
The Harish D 10 includes:—

A '2 × 2' counterflow system in which two identical compartments are countered. This eliminates loss of energy and the innovation in the float dryer helps increase production by 20%.

The D 10 incorporates the latest in drying technology the flow through system—an improvement over the conventional impingment technique. This results in substantial energy savings, increases fuel efficiency and optimises air changing and re circulation within the dryer. Drying capacity increases between 50% and 80%.

The D 10 is available optionally with a gas burning system or with an oil burning system and helps save over 20% of fuel losses.

The D 10 also incorporates computerised overfeed and shrinkage control for perfect quality control. More Digital programmable PID, temperature controls to ensure correct heat setting, photo electronic edge sensors with zero backlash feeders to achieve straight line pinning are exclusive features that make D 10 ready for tomorrow's needs — today.

Energy consumed KWH (5000 hrs in a year)	84290	83350
Running cost Rs	29500	29170
Insulation life hrs	30000	100,000

Note: Winding temperature of standard motor when operated in cotton fluff atmosphere is higher by 20°C and the efficiency is reduced by 1% due to higher I^2r losses.

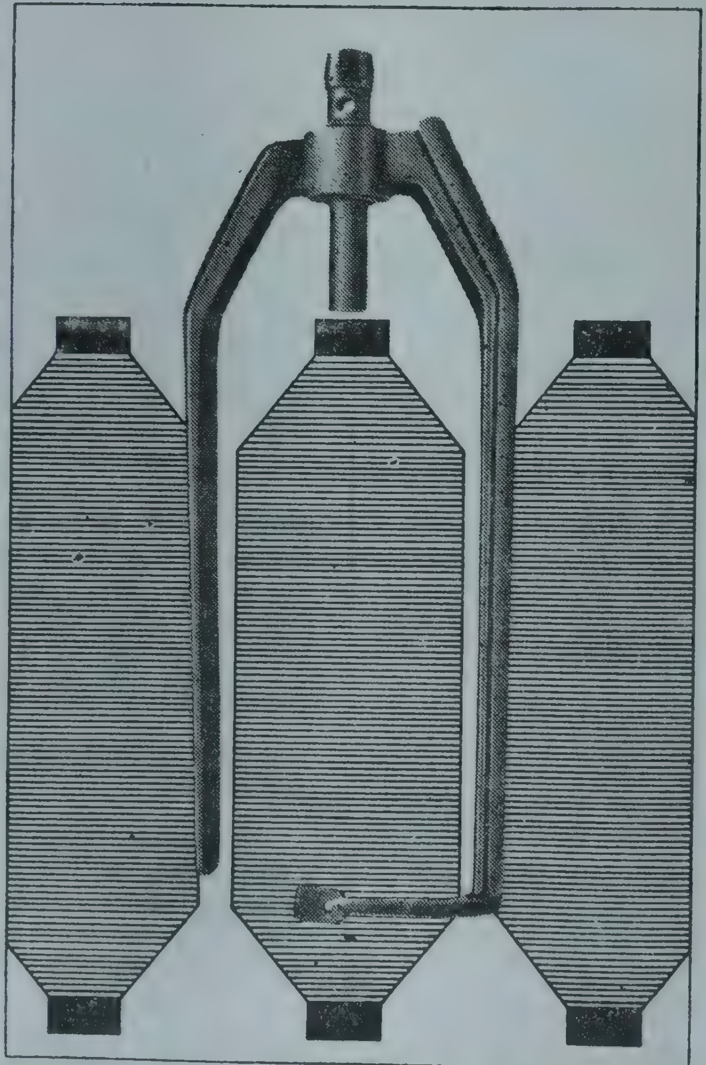
against valves which are partly closed. As a general rule, savings in power consumption of 50 per cent or more can be obtained by using speed control instead of valve control in most pump installation. The squirrel-cage motor used to have only one disadvantage the difficulty of controlling its speed. However, the arrival of the frequency converter has now removed this obstacle. Each pump is designed to operate within a certain range. This range is defined by various factors and is normally known as operating range for a pump. Beyond this operating range the pump efficiency is quite poor and it is uneconomical to operate in the long run.

Variable speed drives for processing machinery

Standard motors are used for machines such as bleaching, washing and drying machines and for their pumps, fans and associated auxiliaries, although low driven speeds often entail geared motor units or low speed motors. Dye jig and winch dyeing machines are fitted with variable speed control for approximately constant linear speed and tension calendered small mangles and other machines requiring speed control over a range upto 2 to 1, with or without reversing are normally driven by slipring motors with drum type controllers. The latter may also be arranged to give threading speeds.

Many machines require a greater speed range and control of speeds at various points, *e.g.* cloth printing machines, stentering ranges, sanforising machines and normally variable speeds drives such as A.C. commutator motor

High Speed Aluminium Alloy Flyers



- Steel middle piece insert hardened for maximum resistance to wear and tear.
- Transverse pin made from high tensile steel, provides positive drive.
- Highly compact package with maximum length of roving per bobbin.
- Presser pivoted on self-locking steel pins.
- Interior surface of hollow arm highly polished on special imported equipment, resulting in minimal frictional resistance.
- Aero-dynamic styling prevents turbulence.
- Black anti-static lacquer finish provides pleasing appearance and prevents accumulation of fluff.
- Smooth rovings with minimum end breakage.
- Maximum rotating speed upto 1400 RPM with minimal spread of flyer legs.
- Gain in production.
- Available in all popular sizes.

or the more precise and expensive Ward-Leonard are used.

In a slipring motor running at 50 per cent of its rated speed, the rotor copper loss alone is equal to output power. The efficiency of slipring motor at reduced speed therefore is poor. This also applies to eddy current coupling motor.

Thyristor controlled DC drive is certainly more costlier than slipring motors but besides its other advantages its saving in energy itself can justify its high cost for certain applications. Comparison of costs of different drives for some of the textile applications is given in Table 7.

Table 7: Drives for processing machinery

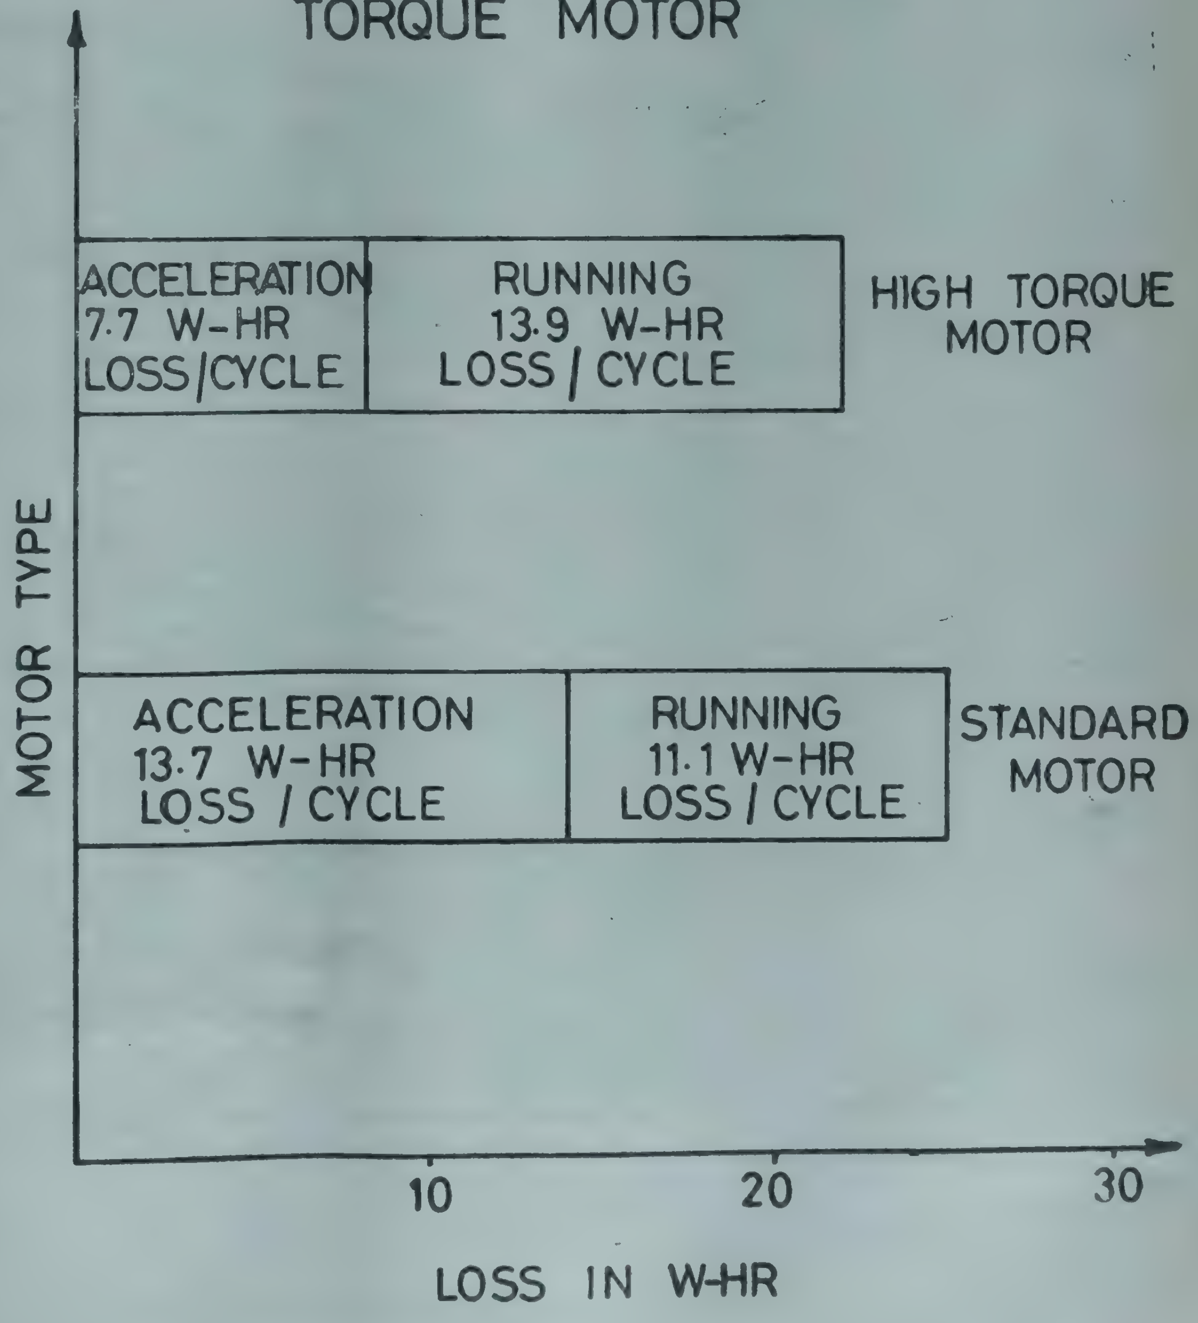
System considerations

The efficiency of an electrical system, of which the motor is a part, is the combination of the efficiencies of all the system components and is affected by many factors. The following are typical.

Application analysis: Widely varying loads with a number of starts and stops deserve careful study. The starts and stops, as well as plugging reversals and braking all consume energy at a higher rate than during continuous operation. To minimise energy usage, the mass of the moving parts should be kept as low as possible—energy used to accelerate these parts is proportional to their mass. And special care should be taken to select the motor best suited for the job. Motors designed for high full-load efficiency may be unsuitable where frequent starting, duty cycle operation, and repetitive shock loading are encountered. In these applications, total energy losses including motor acceleration losses as well as motor running losses must be considered.

Fig. 3 compares the watts loss of a 80.5 per cent efficient high torque motor and a 83.4 per cent efficient standard design 5 HP motor on a duty cycle that accelerates a load inertia of 1.14 kgM² to full speed and runs at full load for 60 seconds. The high torque motor is able to accelerate the load inertia with less energy and has a lower watts loss during acceleration than a standard motor. The standard motor is more efficient and has less energy loss than the high torque motor during the actual run cycle. Combining both the acceleration and run losses completing the duty cycle clearly indicates that the high torque motor is the best energy choice inspite of having a lower efficiency.

FIG:3 ENERGY USAGE COMPARISON - STANDARD MOTOR VS HIGH TORQUE MOTOR



Process and machinery: Alternate means of accomplishing a job are frequently available. The most efficient methods and machinery should be selected after which the appropriate motor

type and rating consistant with system economics can be specified.

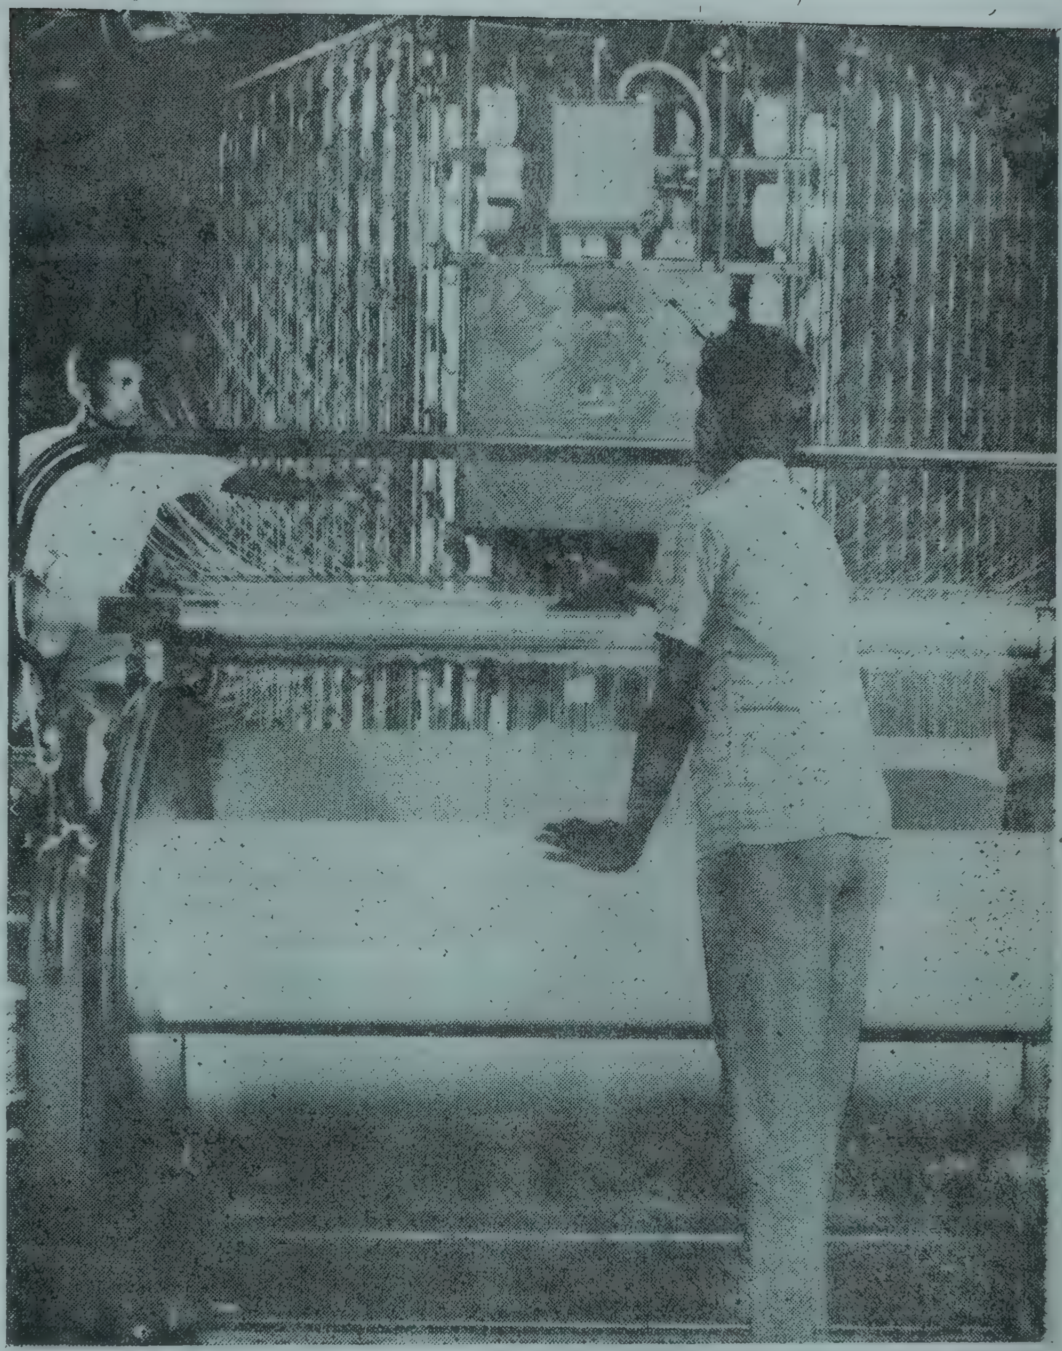
First cost and long-range energy costs: Where loads and speeds very, the system can vary widely in first cost and in operating efficiency, depending on the drive selected multispeed or adjustable speed motors *vs* throttling control or a high speed motor with speed reduction *vs* a low speed motor.

Load shut down and shedding

Where motors run for an extended period of time at no load between loaded periods, energy may be saved by shutting down the motor and restarting it for the next load period. For example, consider a 4-pole, 15 HP induction motor driving a load with inertia equal to the motor inertia. One acceleration will use 7,000 kw-sec of energy, and no load losses are 500 watts. The energy consumed by one start is thus equivalent to running the motor at no load for 7,000/500 or 14 seconds, and energy can be saved between starts only if the rest period exceeds 14 seconds.

Other factors may affect the decision to shut down between starts the motor type and speed, restrictions on inrush current, the extra winding stress imposed by repeated accelerations, and the need for cooling (heat dissipation could be greater when the motor is running at no load than when it is de-energised). Smaller motors with external inertia equal to rotor inertia may be started as frequently as one per minute. As motor size and/or connected load inertia increase, frequency of starts must be reduced.

In applications where motors run continuously, such as ventilating fan loads. load shedding may be used to conserve energy the apparatus is cycled off for a short period of time each hour. The energy balance and the motor's thermal capability will be affected as discussed above.



A Barber-Colman warper in operation.

Group vs individual drive : For extensions and replacements, individually driven machines are now almost invariably used. The new textile machinery now has the motor and starter built in as an integral part. The use of individual motors and associated equipment involves appreciably higher expenditure than group drive. Against this higher cost must be balanced the many advantages of the individual machine drive in production, quality and convenience aspects, amongst which are :—

The inherent facilities for overtime working and freedom from complete stoppage, even drive, minimum transmission losses and power consumption; absence of line shafting improves natural and artificial lighting.

Table 8 compares the energy consumption by 100 nos. ring frames with individual drive *vs* group drive.

Table 8 : Individual drive Vs group drive

		Individual drive	Group drive
1.	No. of ring frames	100	100
2.	Load per ring frame HP	20	20
3.	No. of motors	100	5
4.	HP of each motor	20	400
5.	Load on each motor HP	20	353
6.	Efficiency of motor at load as (5) above	89	93
7.	Input power kW .. .. (only 75 ring frames operating)	1250	1416
8.	Units consumed kWH .. .. (5000 Hrs in a year)	6,250,000	7,080,000
9.	Cost Rs. .. .. (at Rs 0.30 per unit)	1,875,000	2,124,000

Note: In case of group drives transmission losses are assumed as 15 .

Maintenance

Too often motor maintenance is neglected. A basic maintenance programme involving periodic inspection and the correction of unsatisfactory conditions will prolong the life of motor.

Efficiency can be reduced as additional friction develops within the driven machine because of the buildup of dust on a fan, misalignment of gears or belts because of the wearing of parts, or insufficient lubrication. The motor has to work harder. reducing system efficiency and increases energy consumption. Regular inspection will detect such conditions.

Every motor should be periodically inspected and unsatisfactory conditions corrected. Items to be checked include, ventilation and presence of dirt and contaminants which can increase motor heating and motor losses; motor and load alignment; belts, sheaves and couplings; tightness of hold down belts; and improper lubrication can increase a motor's load and use up additional energy.

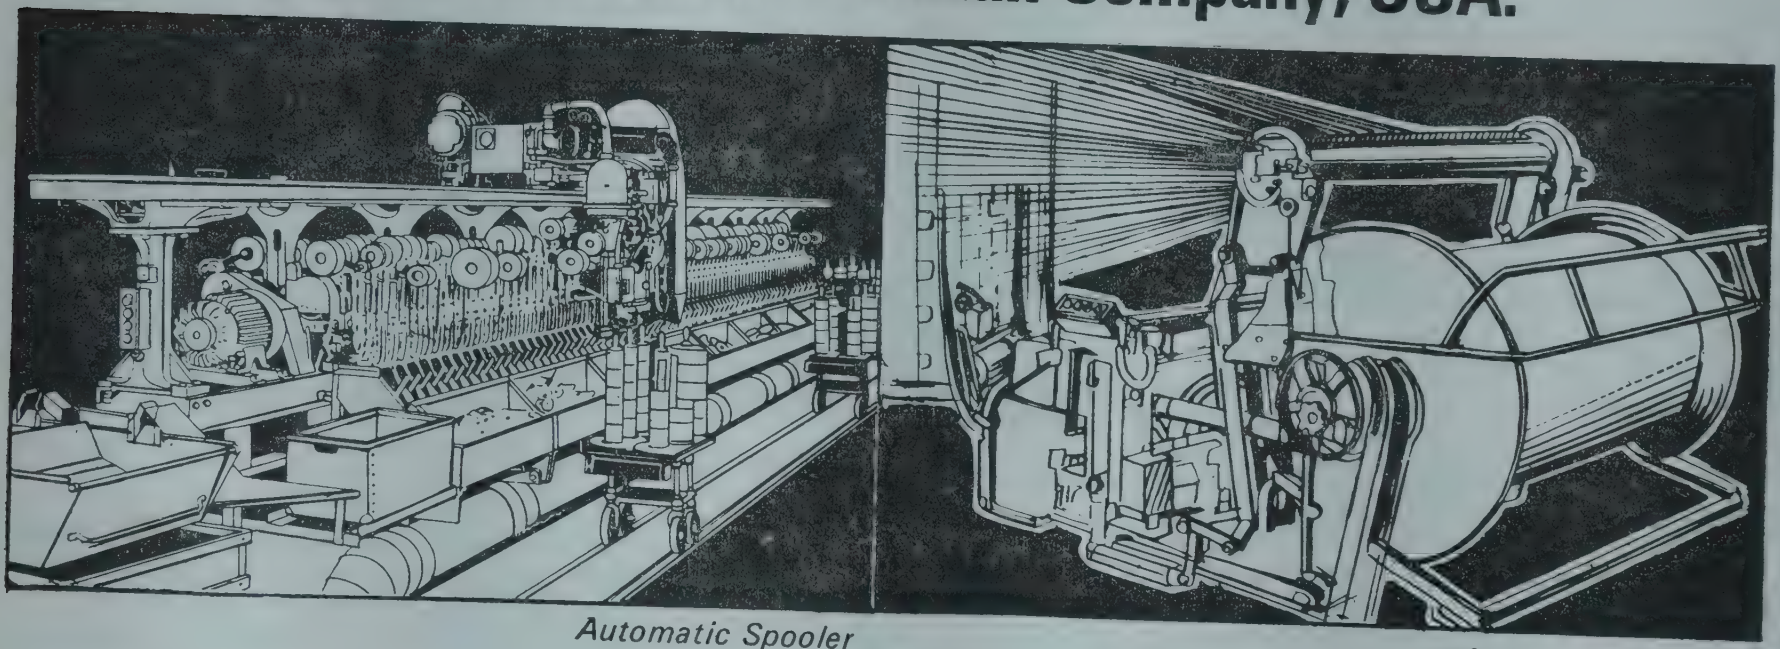
Electrical lighting

The following points may be considered at time of selecting lighting system : (1) Required level of illumination for different works area; (2) Lighting source; (3) Maintenance and control.

The steps which will be quite effective towards energy conservation for lighting system are as follows : (1) Review on group switching; (2) Replacement of in-efficient lights; (3) Increase in efficiency of dispersal; (4) Photo cell operated switch for streets and yard lights.

In textile mills, fluff obscures shed lighting efficiency. Shed lights become defused due to the fluff deposition on the fittings. Cleaning and removing fluff etc from reflectors and tube lights would enable reducing the number of tubes without affecting lighting efficiency.

Now Available in India
Automatic Spoolers and Warpers manufactured under licence from Barber Colman Company, USA.



Automatic Spooler

Automatic Warper

Main features:

- Reduction in cost
- Higher loom efficiency
- Superior yarn cleaning
- High production
- Flexibility
- Ease of operation
- Mechanically tied weavers/double loop weavers knots
- Maintains yarn elasticity
- Equipped with mechanical by-pass for increased efficiency & better flexibility

Batliboi experts will be pleased to help you in inspecting the existing machines and rendering service with supply of spare parts.

Manufactured, Marketed & Serviced by:

BATLIBOI

BATLIBOI & COMPANY LIMITED
Regd. Office: Apeejay House, 6th floor,
Dr. V. B. Gandhi Marg, Fort, Bombay-400 023.

Revolutionary electronic hot air stenter

'HARISH' who pioneered the manufacture of indigenous hot air stenters have recently introduced a total new concept in stentering technology which increases the production by 30-40 per cent and at the same time cuts down fuel costs by 30 per cent. The following new features have been added for the first time in India to make the latest technology available to the Indian textile industry.

Two & Two counter flow system

In this case both the air fans are placed on the same side and the air flow is in a vertical plane. The entire air distribution system is designed in such a way that the resistance to the air flow is reduced drastically which increases the jet velocity and drying capacity. The productivity increases by atleast 20 per cent.

Progressive re-circulation of the exhaust-heat recovery system

Normally, the major evaporation of the water from fabric takes place in the initial chambers whereas the air that is exhausted from the subsequent chambers contains very little moisture. This results in too much wastage of heat through exhaust. In progressive re-circulation, the exhaust of the following chambers is re-circulated to the preceding chambers and the final exhaust takes place only from the first chamber under controlled conditions. This results in about 20 per cent fuel saving.

Direct firing

On the D-10 stenter, direct firing can be incorporated *i.e.* high speed diesel oil or gas is fired directly in the stenter. There is no necessity of steam, electrical or thermic fluid heating as any temperature can be attained and at the same time combustion is 100 per cent. Specially imported burners are used to achieve perfect combustion. Obviously this saves substantial fuel cost. The diesel consumption per chamber is only about seven litres per hour on an average. It is not compulsory to have direct firing arrangement on a D-10 stenter which can also be used with steam, electrical or thermic fluid heating. Naturally, the choice of the heating arrangement depends on the local prices of the various fuels.

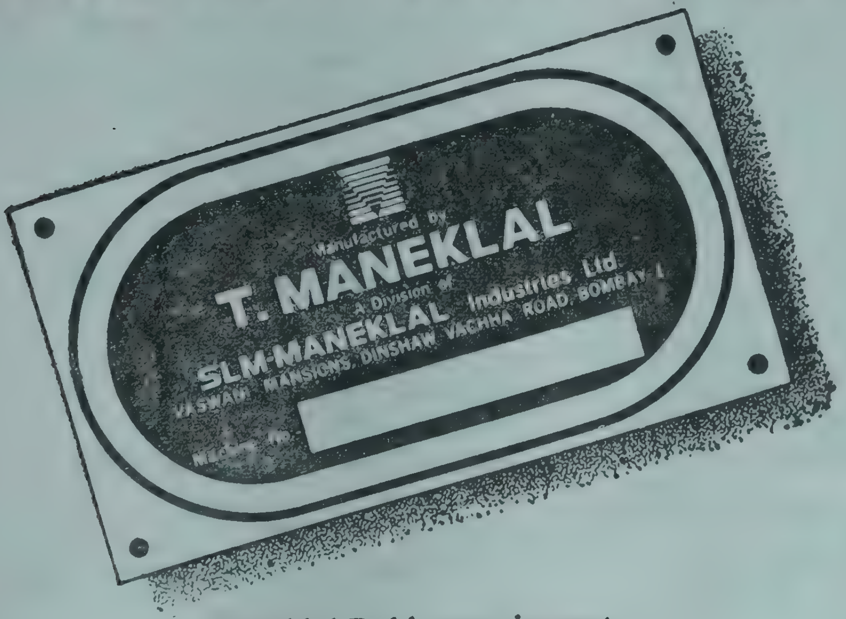
Overfeed computer

This computer measures the actual shrinkage at the delivery end and accordingly automatically sets the overfeed to get a constant shrinkage while heat setting.

Closed circuit TV

A closed circuit TV is provided so that the operator at the feeding end can see the various parameters like temperature, delivery end, etc. The TV could also be put in the cabin of the supervisor or director who can constantly monitor the parameters of the machine.

Sophisticated rubber equipment for Textile Machinery carries one well known label in India.



Manufactured by
T. MANEKLAL
A Division of
SLM-MANEKLAL Industries Ltd.
VASWANI MANSIONS, DINSHAW VACHHA ROAD, BOMBAY-1
Machine No.

Maneklal Rubber equipment
is a discerning textile machinery
buyer's first choice.
Because it is backed by a team
which also specializes in
textile machinery.

RUBBER ROLLERS

For the Textiles, Paper, Steel and Plastics Industries and smaller units like plywood, rice mills, photocopying machines and printing presses.

RUBBER BLANKETS

Etablissements Rollin, France and Maneklal offer world class rubber blankets in various sizes for the Textile Industry.

RUBBER BELTS

Maneklal manufactures high quality belts for application in Sanforizer/Shrinking Machinery

SLM-MANEKLAL
Industries Ltd.

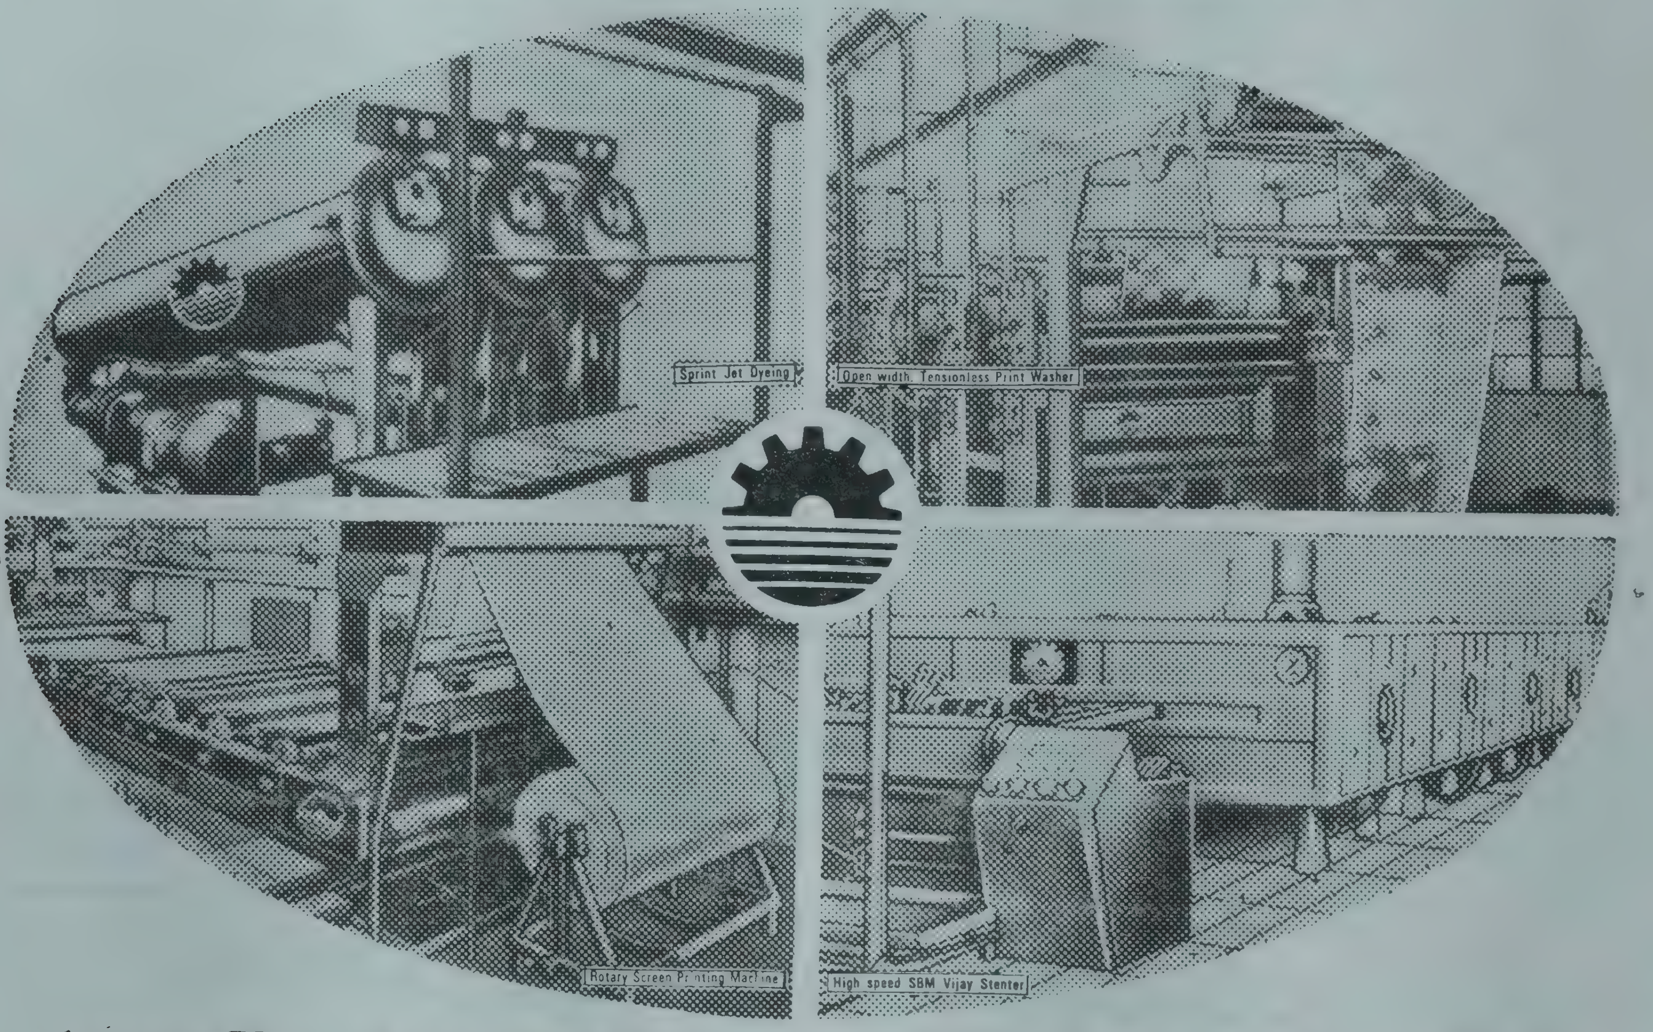
SBM offers International know-how to add momentum to the processing industry...



Sprint Jet Dyeing
Open width Tensionless Print Washer
Rotary Screen Printing Machine
High speed SBM Vijay Stenter

textile machines geared for the 80's

SBM Engineering specialises in services and machines for the Textile Processing Industry. It manufactures Bleaching, Dyeing, Printing, Mercerising and Finishing Machines for cotton, synthetic blends and handloom fabrics. Undertakes feasibility studies, plans and supplies machines, erects and commissions plants, trains personnel on a turn-key basis.

Formed by a dynamic group of young technocrats with varied experience in India and abroad, the Company has grown at the rate of nearly 300% per annum. This growth itself reflects the ingenuity and expertise of the technocrats involved in the Company, who have developed machines with built-in economies to suit the need of Indian textile units.

Growing Fame

Now leading Textile Companies around Bombay, the South and many more all over India, rely on SBM Machines. Among them are Bombay Dyeing, Thackersey Group, Piramal & Maheshwari Group of Mills, Lalbhai Group, National Textile Corporation Ltd., Tata Group of Mills, Birla Group, Hukumchand Mills, Hyderabad State Government Projects, DCM Group, Andhra Pradesh State Textiles Processing Co-operative Society Ltd.. to name just a few. And these companies have come repeatedly to SBM Engineering, because they are sure of getting something better.

Forging Ahead with Foreign Collaboration

SBM Engineering has now entered into foreign collaboration with some reputed foreign firms to expand its range of machines like :

* SIR JAMES FARMER NORTON & CO. LTD. U.K. for an Open Width Continuous Bleaching System on the Principle of combination of Roller Bed Steamer, with higher operational economy.

*PLATT LONGCLOSE ENGLAND, for a Ventura Sprint Jet Dyeing Machine with low liquor ratio for greater economy.

* REGGIANI MACCHINE, ITALY, for Rotary & Flat Bed Automatic Screen Printing Machines.

* INGENIEURBURO OF WEST GERMANY for a New Heat Recovery System and new developments in Processing Machines.

paper, printing or textiles

HINDUSTAN RUBBER ROLLERS ARE VERSATILE

In fact HINDUSTAN RUBBER ROLLERS are irreplaceable for all types of Silk and Cotton Textile units, paper and board mills, leather cloth units, plastic and packaging industries, cement and asbestos manufactures and leather units.

HINDUSTAN RUBBER ROLLERS are made to precise specifications from natural, synthetic or neoprene rubbers as required Hardness and bondage of metal core with rubber is guaranteed. All rollers have smooth, polished and ground surface, true to journals.

The workmanship is guaranteed, the service is prompt and deliveries immediate and satisfactory.

Special Reports

Essential services: Strikes and go-slow punishable

New Delhi

THE Government of India assumed sweeping powers on July 27 to prohibit strikes in essential services which have been widely defined in an ordinance even to include the 42 industries in the public and private sectors listed in the scheduled category in the Industries Development and Regulation Act of 1951.

The Essential Services Maintenance Ordinance, 1981, issued by the President on that day, after a meeting of the Union Cabinet, says that the services in which strikes could be banned are posts and telegraphs, all forms of transport, airports, major ports, banking, customs, oilfields and refineries, defence, conservancy, sanitation and hospitals under the control of the Union Government as well as in the 42 scheduled industries.

Any person resorting to an illegal strike will be liable to be punished with imprisonment or fine. He will also be liable for disciplinary action including dismissal. The offences under the ordinance are cognisable and triable summarily. Go slow and refusal to work overtime where such work is necessary for the maintenance of any essential service is also punishable under the ordinance.

Initially the strikes will be banned for six months but the ban may be extended for a further period of six months. The Government proposes to introduce legislation in the forthcoming session of Parliament to replace the ordinance and the new act is expected to be valid for three years.

Predictably leaders of central trade unions have reacted violently against the ordinance. Some of the political leaders have also voiced their concern at the action taken by New Delhi and the Chief Minister of West Bengal, Mr Jyoti Basu, has described the ordinance as "thoroughly undemocratic". He said it amounted to emergency measures without emergency declaration.

Employers, however, have welcomed the ordinance, though, by and large they refused to comment on it. However, the president of the Indian Merchants' Chamber, Bombay, Mrs Sharayu Daftari, said that the ordinance was long overdue and "the effort is a good beginning".

The ordinance declares any person commencing a strike which is illegal under the ordinance or who instigates or incites other persons to commence or to go on any such strikes is liable to disciplinary action including dismissal. Further any person who goes on an illegal strike is punishable with imprisonment for a term which may extend to six months or to pay a fine which may extend to Rs 1,000 or with both.

The 42 industries listed in the scheduled category are: aircraft, arms and ammunition, coal, including coking and derivations; iron and steel, mathematical, surgical and drawing instruments;

Scientific instruments; motor and aviation fuel; kerosene, crude oils and synthetic oils; ships and other vessels propelled by steam or electricity or other mechanical power; sugar, telephones, telegraph and wireless communication apparatus;

Textiles, including cotton, jute, woollen, silk, artificial silk and staple

Strikes, lockouts and mandays lost: 1970 to 1980

(P) = Provisional N.A. = Not Available
Note: Disputes refer to strikes and lockouts.

fibre; automobiles; tractors; cement; electric pumps, electric fans, electric motors, heavy chemicals, including fertilisers;

Machinery used in industries, including boilers and steam generating equipment; ball, roller and tapered bearings; locomotives; rolling stock; machine tools; machinery and equipment for generation, transmission and distribution of electricity;

Non-ferrous metals, including alloys; paper, including newsprint, paper boards and straw boards; pharmaceuticals and drugs; power and industrial alcohol, rubber goods, leather, leather goods and pickers;

Glue an gelatin; vanaspati, vegetable oils; agricultural implements; batteries, dry cells and storage batteries, bicycles, hurricane lanterns, internal combustion engines, power-driven pumps, radio receivers, sewing machines, knitting machines, small tools, hand tools, glass and ceramics, dyestuffs, soaps, other toilet requisites, plywood and ferro-manganese.

Official sources have explained that the decision to ban strikes in the scheduled industry would be subject to a rider. Recourse would be taken to this drastic action only when disruption of service endangered the safety of an industrial undertaking or that of its employees or employers.

Some observers have interpreted the Government's action as a continuation of its fight against inflation inasmuch as maintenance and increasing of production is so essential in that fight.

Gas or coal-based fertiliser units?

From OUR NEW DELHI BUREAU

NEW DELHI

SINCE application of fertilisers has been a key element in India's agricultural advance, their consumption has been increasing with the result that indigenous production has not kept pace with the growth in fertiliser demand. Fertiliser production during the current year is estimated at 41 lakh tonnes against the projected demand of 66 lakh tonnes, which means that 25 lakh tonnes are to be imported. Expansion of indigenous fertiliser production in order to move towards self-sufficiency is, therefore, a major development objective. But the attainment of this objective involves a vital policy decision which is not entirely incontrovertible.

Should fertiliser plants of the future be based on a feedstock of oil derivatives, gas or coal? At present the Indian fertiliser industry is based mainly on oil derived feedstocks like naphtha, fuel oil and low sulphur heavy stocks. As such the industry has suffered from all the uncertainties and problems relating to oil supplies. The constraint of dependence on oil-derived feedstocks can be seen from the fact that in 1980-81 oil supply problems because of the Assam blockade resulted in the fertiliser production falling short of the target by 5.5 lakh tonnes and being even less than that in 1979-80, when there was a severe power shortage. It is thus obvious that installation of new capacity in the fertiliser industry will have to be either gas-based or coal-based.

The Government's preference seems to be moving in the direction of gas-based plants, evidently because of the confidence generated by the discoveries of gas in Bombay High, Bassein and other fields. Four large gas-based plants to produce nitrogenous fertilisers, two at Thal Vaishet in Maharashtra and two at Hejira in Gujarat, are already under way. The problem created by the non-availability of World Bank aid for Thal Vaishet is sought to be tackled through attempts to arrange export credit assistance from countries like Italy, France, Japan and Britain. For Hejira, a World Bank loan of $250 million is expected, although delay in its clearance is causing some worry. Half a dozen more fertiliser plants are planned to be set up in Rajasthan, Madhya Pradesh and Uttar Pradesh by bringing the Bombay High gas into the hinterland through a pipeline running from the west coast to Delhi.

Some fertiliser experts, however, question the wisdom of near-total dependance on gas-based plants for future fertiliser production expansion

UP's power crisis

UTTAR Pradesh experienced considerable hardship during the month of July on account of the sudden fall in the power supply in the State. The position became so bad that power supply to the rural areas as well as to arc furnaces had to be suspended. The immediate cause of the aggravation of the crisis was the closing down of two equipment in the Harduaganj power station due to flooding by rains. Although heavy rains were stated to be the cause of the power crisis in the beginning of July, water level in the hydel reservoirs, which account for 40 per cent of the installed capacity of power generation of the State, was stated to be lower this year during mid-July than it had been during the same period last year. Earlier in May this year thermal generation had gone down to almost as low as a quarter of the installed capacity. The poor quality of coal supplied to the power stations was stated to be the cause of the unusually low power generation at that time. This time also it is the fall in generation in the thermal plants that has affected power availability, which has never been quite satisfactory in Uttar Pradesh.

During 1980, the availability of power in Uttar Pradesh at 10,144 million kwh fell short of the requirement of 15,096 million kwh by nearly 33 per cent. It was a bad year for power in the State. Generation went down to 10,768 million kwh from 11,522 million kwh during 1979, despite a rise in installed capacity to 3,436 mw from 3,132 mw in 1979. During the first five months of 1981 the availability of power in Uttar Pradesh was 20 per cent less than the requirement. The situation during the first five months of this year was somewhat better than during the corresponding month last year when the shortage in the availability of power was almost 37 per cent. It has to be noted, however, that the requirement during January-May 1981 was estimated lower at 6,506 million kwh compared with 6,654 million kwh in January-May 1980. However, things took a turn for the worse from the end of June. The shortage of power has rendered idle as much as 80 per cent of the installed capacity of the mini steel plants in the State (total capacity over 5 lakh tonnes involving an investment of over Rs 50 crores). The very unsatisfactory rate of utilisation of capacity of the mini steel plants has landed them in a very serious financial crisis, a large portion of their capital having been eaten up. Thus at the State level, in Uttar Pradesh we have the same phenomenon of capital invested at great sacrifice to the people lying idle, aggravating the very problems of the people to solve which the investment had been made in fact. This vicious circle must be broken.

which amounts to a neglect of the possibilities on the coal side. Their contention is that though 15 million cubic metres of the daily total production of 20 million cubic metres of gas have been earmarked for the 10 gas plants, it is difficult to be certain that this level of production will continue to be available for another 20 years. On the other hand, coal is available plentifully in several parts of the country. The two coal-based fertiliser plants set up last year at Talcher and Ramagundam are proving the success of coal gassification technology.

In fact, indications of reserves of over 60,000 million tonnes in the Kalol region in Gujarat—which however, are at a great depth of 4,500 feet against the maximum depth of 2,000 feet reached so far in Indian coal-mining—have encouraged the suggestion that the possibilities of on-site coal gassification should be explored. However, although a technical team which has recently returned from Europe has painted an optimistic picture, the technology required would be rather sophisticated and is presently at the stage of experimentation even in the advanced countries.

Another point mentioned in favour of coal-based fertiliser plants is that they enable a greater degree of technological self-reliance. The Talcher and Ramagundam plants have been designed, engineered and built by Indian agencies and prime consultants after the process know-how had been bought from abroad. It is pointed out that in the building of these plants the cost of foreign engineering services was only 2.7 per cent.

Taking the pros and cons of both the sides there does seem to be a case for striking a better balance between gas and coal as feedstocks, which means that perhaps more attention ought to be paid to the possibilities of coal-based fertiliser technology.

In the meanwhile the Agriculture Ministry's latest four-month review of the overall fertiliser situation shows an improvement on all fronts. During February-May this year production of nitrogen went up by around 2.5 lakh tonnes compared to 6.52 lakh tonnes in the corresponding period of 1980. Production of phosphate also recorded a marked rise to 3.22 lakh tonnes compared with 2.99 lakh tonnes in the previous year. Arrangements regarding imports have also progressed apace. During February-May imports of fertilisers totalled 5.5 lakh tonnes compared with 4.15 lakh tonnes last year. Imports of phosphate amounted to 51,000 tonnes. Potash import was higher at 3.10 lakh

---

RAJASTHAN

Dynamic administrator

JAIPUR

MR Shiv Charan Mathur (55) is Rajasthan's ninth Chief Minister having replaced the lacklustre Mr Jagannath Pahadia, who in his 13 months of rule could hardly do anything for the State's welfare. Mr Mathur, observers say, has now to salvage the State from the ruins left behind by Mr Pahadia.

Mr Pahadia, who was thrust upon from New Delhi in June 1980 to take over the Chief Ministership, was the choice of the late Mr Sanjay Gandhi. Of course, Mrs Gandhi also gave her blessings to Mr Pahadia who was then her Minister of State. In the Cong-I the choice of Mr Pahadia created a near furore but the voice of dissent could not be raised due to the support he enjoyed from Mrs Gandhi and Mr Sanjay Gandhi.

Mr Shiv Charan Mathur

Mr Pahadia just wasted his time in petty things. He would never take anybody into confidence as he suffered from many complexes besides carrying a fear always that everybody was after him. In June 1980 when Mr Pahadia landed here he was almost unknown to the people and he was in such a position that he could have built up good image for himself. Instead he relied on corrupt officers and outdated politicians.

The task ahead for Mr Mathur is no doubt gigantic and looking to his wide knowledge and eagerness to go into the problems he can deliver the goods. Mr Mathur, interestingly, was not inducted by Mr Pahadia into his cabinet.

Mr Mathur, who hails from the backward Bhilwara district, is an upright Cong-I leader who believes in doing things. He is a doer and observers note that if he is able to enlist the support and co-operation from all quarters he may do wonders.

In the past as a senior minister in the governments of Mr Mohanlal Sukhadia and Mr Harideo Joshi, Mr Mathur had done wonderfully well displaying keen desire to take up developmental schemes. He took lot of interest in dairy development in Rajasthan where the achievements are impressive.

Mr Mathur does not have any group of his own in the Cong-I and his election was largely due to Mrs Gandhi who picked up him as she knows that in the present circumstances it is only he who can deliver the goods.

Mr Pahadia was sacked as he failed to deliver the goods and seen in this context Mr Mathur will have to show results in the near future. He should rise to the occasion and take some bold and dynamic decisions which may stem the rot created by his predecessor.

He has begun well by taking talent into his ministry. Mr Chandanmal Baid, who has been given the vital portfolio of Finance, is known for his wide knowledge in dealing with the difficult financial problems. In the past he had done wonders as Finance Minister turning the huge deficit into surplus.

Mr Parasram Maderna, who has been given the Departments of Power (Energy), Irrigation and Revenue, is a strong man capable of taking bold decisions.

tonnes compared with 2.36 lakh tonnes in the previous year. As a result of improvement in indigenous production and import arrangements, the supply of fertlisers during February-May also increased to 15.4 lakh tonnes from 12.89 lakh tonnes in the corresponding period of 1980.

In a bid to broadbase the fertiliser supply and distribution system down to the block level, the Government has initiated a number of measures. The basic feature of the new supply policy is that fertilisers will be supplied to every block headquarter in the states instead of the nearest railhead point of a district, as at present. This will ensure timely availability of this critical input at the right point of consumption. However, the success of this innovation will depend on the availability of micro-level data as well as the capacity to take fertilisers right into the interior by road.

Money

Who bears burden of inflation ?

DURING the thirty years between 1950-81, the absolute volume of real goods and services has gone up by 200 per cent, as measured by real rise in national income. Despite this growth consumer prices have risen by 400 per cent and wholesale prices by 440 per cent because population has risen by 63 per cent in this period, and gross national expenditure, as measured by money supply, has risen by 2,000 per cent and gross monetary resources in total have risen by 3,500 per cent.

Put it in annual terms. The real national income has risen at the rate of 3.5 per cent per annum, population two per cent per annum, money supply at 10 per cent per annum and monetary resources at 11.5 per cent per annum during the last thirty years, resulting in an average growth of prices at 5.5 per cent per annum.

Is this tolerable for the individual ? Companies, corporations and governments may be able to tolerate these trends but for individuals, these trends are going beyond tolerance limits. How ?

Prices are likely to rise between 14 to 18 per cent in the current year 1981-82. If these trends are projected throughout the eighties, in the next ten years, we may have an annual real rise of 15 per cent in prices, because the rise in real national income will be three per cent per annum, population will again be two per cent per annum, and gross national expenditure will be 20 per cent per annum. What is the meaning of 15 per cent per annum growth in prices during the next ten years ? Let us see what happens if the rupee is assumed worth 100 paise today (although it is already worth 20 paise compared to 1951 !) (see Table).

Obviously, this is not tolerable, because you can't make plans for anything worthwhile on the basis of inflation rate of this magnitude. It took us thirty years to bring down the rupee to 25 paise : now we can do it again in ten years !

Impact of inflation at an annual rate of 15 per cent.

Year	Worth of Re I paise	Cost of goods and services Rs paise
1981	100	1 . 00
1982	87	1 . 15
1983	76	1 . 32
1984	65	1 . 52
1985	57	1 . 75
1986	50	2 . 01
1987	43	2 . 31
1988	38	2 . 66
1989	33	3 . 06
1990	28	3 . 52

Yet businessmen make plans for future precisely in this environment, without providing for this rate of inflation. It is because they know what the banks and financial institutions do not know. Once they commit banks and financial institutions the costs of delays, overruns and of inflation can be forcibly pushed on to them — whether they like it or not. Although, all financial institutions provide that the cost of overrun will be borne by the borrowers, they just can't help it.

Whatever be the stipulations, whatever be the legal situation, when a deadlock is reached, borrowers are able to exert pressure on the institutions to relax, and to provide finance for the cost of overruns and delays in one form or another. Maybe sometimes overruns and delays masquerade as expansion, modernisation, balancing equipment and so on. But all the burdens eventually fall on the institutions, diluting promoters' share, increasing debt-equity ratio and lowering debt servicing capacity of the plant.

This whole game of investment in face of an inflationary psychology is like a country where nobody speaks the truth. None of the voluminous data that entrepreneurs submit to the institutions speaks the truth and what is more pernicious, the institutions do not have the time or the inclination to find out the truth.

S. G. Shah

COMPUTERS

Controversy over import

From ARVIND BHANDARI

NEW DELHI

A CONTROVERSY has arisen in regard to the supply of 140 computers to the Union Government against what is going to be the biggest single order for computers ever placed in India. Should these computers, estimated to cost about Rs 5 crores, be supplied by indigenous or foreign manufacturers?

The Union Education Ministry has launched an ambitious programme to equip all universities, regional colleges and technical institutes (other than IITs) with computers. These computers will function as teaching aids and meet the computation requirements of various faculties. The tendering for procurement of the computers has been entrusted to the Department of Electronics (DOE) and the entire purchase is to be completed over the next two years.

Industry sources complain that DOE has drawn up the specifications for the tender in such a manner that it precludes the possibility of indigenous manufacturers meeting the requirements. They claim that the Indian computer industry has a manufacturing ability which exceeds the requirements of students in engineering colleges and universities. While imports of large computer systems for critical areas

like defence and space research are understandable, computer requirements in other fields should be left to be met by the indigenous industry so that it may get a chance to develop further. Moreover, students trained on imported computers acquire an expertise which may not be always useful for Indian organisations. Further, the process of imports, once started, is difficult to end because systems need to be frequently updated.

The Indian manufacturers say that as it is they face an uphill task because of the high cost of imported peripherals needed in the manufacture of indigenous systems. They were looking forward to the massive Education Ministry order as an opportunity to step up their indigenisation programme. They also wonder whether DOE has taken care to ensure the availability of the sort of infrastructural facilities that would be required in the event of computers being acquired in accordance with the specifications drawn up by it. As regards the comparative cheapness of imported computers, it is contended that the foreign companies may supply the computers at a low price and then make their margins subsequently in the supply of spares.

Sources in the Department of Electronics deny that there is any deliberate intention to deprive the indigenous industry of an opportunity to partake of the computers order. If they could compete successfully with the foreign companies, the orders would go to them. The main yardstick is quality and standards. While the interests of the indigenous industry are no doubt important, quality and standards cannot be compromised. As it is, India is suffering from technological obsolescence.

Neither is it correct to say that the specifications have been artificially jacked up. In fact, the specifications were drawn up not by DOE but by an independent committee of experts which included representatives of educational institutions, who would be the users. The problem is that the Indian manufacturers have been, because of the commercial angle, concentrating on manufacture of computers for processing business data and have neglected development of computers for processing scientific and technological data. Now that they are not able to come up to the requisite standards, they are making a hue and cry. Moreover, they have had a broad idea for quite some time now about the nature of the specifications for the sort of computers that would be required in the field of education.

As I see it

Locational concentration and inflation

ONE of the factors that has accentuated the phenomenon of urbanisation without proportionate development of industrialisation is no doubt the practice, so assiduously followed in the face of the declared and repeatedly reiterated national policy of balanced regional economic investment and development, of locational concentration of industries in particular geographical areas. Denied any opportunity of securing gainful employment near their homes (since development takes place in areas far away) persons are compelled to travel long distances to unknown places in search of gainful employment of some sort, contributing to the worsening of the already unsatisfactory housing condition and promoting the growth of substandard living in urban areas like Bombay and the other major cities. For no area, however, economically and industrially developed, can ever hope to accommodate the job-needing population of even one state, not to talk of that of the entire country.

The locational concentration has created an excessive pressure on the country's transport system which, in turn, has exacerbated the inflationary pressure. The gradual deterioration over the past decade is seen from the fact that while in 1969-70, the first year of the Fourth Five Year Plan, the average lead of traffic hauled over the Indian railway system at 617 km was well below the assumed lead of 630 km for the Plan, by the end of the Plan period in 1973-74, the average lead went up to 662 km. In the Fifth Plan the position became much worse. Against an assumed lead of 678 km for the Fifth Plan, the actual average lead in the very first year (1974-75) of the Plan was 686 km. By the end of the Fifth Plan in 1978-79 the average lead went up further to 693 km. In 1979-80 it was 717 km — 100 km longer than it was ten years earlier.

In other words, over the period of ten years the railways were called upon to cover an additional average distance of 100 km per wagon, which had the effect of reducing the availability of wagons. The other effect was higher transport costs and consequently higher market prices of commodities. For example, during 1979-80 the average lead of cement transport by the railways increased to 759 km from 645 km assumed in the Fifth Five Year Plan. The figures for fertilisers were 1,081 km against 750 km, for foodgrains 1,253 km against 1,050 km and other commodities 691 km against 800 km. While in 1976 the number of wagons loaded with cement was 99 per cent of the requirement of the industry, it fell to just 64.5 per cent in 1979. This led the Cement Controller and the Railway Board to agree that from July 1, 1978 all movement of cement from factories up to a distance of 250 km for all categories of consignees would be by road only. The extra expenditure on road haulage was agreed to be added to the sale price of cement. Similarly during 1978-79 for want of covered wagons imported fertilisers were agreed to be moved by road up to 500 km and indigenous fertilisers up to 1,000 km by subsidising the additional cost on road haulage.

While on the one hand subsidy was being paid from the public exchequer on road transport of fertilisers, the railway revenues suffered because of a fall in the quantity of fertilisers and cement hauled by the railways. This provided the ground for raising the freight and passenger fares to augment railway revenues and, in the process, fuelling the inflationary rise in prices of not only cement and coal but also of many other commodities and services. To fight inflation effectively thus requires, among other measures, a more balanced economic growth in the various regions of the country.

Subhash Chandra Sarker

Another important aspect is cost. Indian computers, which in any case are not wholly indigenous because of the imported peripherals, are costlier. DOE sees no reason why the Government should spend more money than is necessary.

The first Indian-designed computer system *ISIJU*, was developed by the Indian Statistical Institute, Calcutta, and Jadavpur University in early sixties. Later the Tata Institute of Fundamental Research, Bombay, developed a computer known as TIFRAC. Though these were valve models, it is felt that with proper encouragement the indigenous industry could have built up by now a large pool of talent in computer hardware.

Petrodollars for tourist hotels

From O. N. KOUL

SRINAGAR

IN the creation of tourism infrastructure, required to cater to a targeted inflow of 1.75 million by 1985, Arabs are obviously the most-favoured investors for the Government of India.

This is clear from the fact that the Union Government has decided to allow 40 per cent equity participation to investors from petrodollar countries against only 30 per cent for others. Another favoured treatment for the Arabs is that they can advance 100 per cent loan to Indian counterparts against a maximum of 50 per cent permitted for investors from other countries. So far, participation of foreign investors in general was limited to equity participation which too was restricted at 20 per cent.

Apparently, the Government of India expects bulk of the tourism infrastructure to come up in the private sector which has been offered tax concessions and assured availability of institutional finance. This is clear from the fact that of about Rs 400 crores expected to be invested in this sector during the Sixth Plan, Rs 200 crores are expected to be contributed by the private sector. As for the Governmental investment in the tourism sector as a whole, the allocation with the Centre is Rs 72 crores and Rs 125 crores are with the state governments.

The Union Minister for Tourism, Mr A. P. Sharma, who was here recently in connection with the two-day meeting of the parliamentary consultative committee, did not elaborate on the nature of private sector participation in the "coordinated approach for tourism development, evolved for the first time, based on pooling the resources of the Centre, states and the private sector". It, however, seems that while the Union and the state governments will together implement the "travel circuit" scheme with or without the changes proposed by Members of Parliament from all the states, the private sector will confine itself to the construction of luxury hotels. According to Mr Sharma, India requires 40,000 hotel rooms for a tourist inflow of 1.75 million by 1985. The present availability is 22,000 hotel rooms and another 9,200 rooms are under construction. He, however, did not rule out the participation of public sector in creating the balance accommodation for the tourists.

As is known, the Union Tourism Ministry, in association with the states and the Union territories, identified and finalised 59 travel circuits, comprising 427 travel centres, for intensive tourism development. Also planned are "Destination South India" and "Destination East India" programmes. As a result of the "Operation Australia", the Central Government decided to continue Air India's services to that country and is seeking "a more viable air fare from Australia to India". An office is proposed to be opened in Malaysia as substantial tourist traffic was generated recently from there to India. The Central Government hopes to record an overall growth rate of 19.4 per cent in the overall traffic from the South-East Asia region.

In 1980, India received eight lakh tourists, of whom over one lakh came from Britain and 78,000 from the United States. A target of 1.2 lakh tourists has been fixed this year for the UK. This is besides the target of 2.5 lakh tourists fixed for the European region. An increase of 15 per cent in tourist traffic is planned from these areas during the current year. This will be a considerable advance, if achieved, in the light of the fact that with 3,42,370 arrivals during January-May last, the country witnessed an increase of 10.2 per cent in the inflow of international tourists over the corresponding period last year. By itself, this has been termed as an "encouraging trend" by Mr Sharma towards the achievement of targets. Foreign exchange earning from international tourism is expected to double to Rs 1,000 crores by the end of the Sixth Plan from Rs 500 crores at present.

Advances in tribology

DURGAPUR

IN the field of tribology, during the recent years, the Central Mechanical Engineering Research Institute (CMERI), Durgapur, along with its Merado Centre at Poona, has made considerable progress in the direction of wear, friction characteristic, uses of solid lubricant and high speed gas bearing, according to Dr S. K. Basu, director of the institute. Dr Basu, who heads the institute since 1976, has specialised in the field of machine tools, tribology, production management and operations research.

Various forms of plastics nowadays available in our country are finding increasing uses in the machine tools industries, defence and chemical industries etc. Tribological properties, particularly behaviour of friction and wear rate of pure and impregnated plastics like tefflon, nylon etc, have been studied under conditions of varying contact pressure on the meeting surface, different velocities of sliding and under various types and modes of lubrication including dry, boundary, and hydrostatic conditions. Work on the optimisation of design parameters, in regard to permissible pressure on the slide in the machine tool, appropriate velocity of traverse and proper lubrication, has already resulted in effective and economic use of different guide materials under different environmental conditions with particular reference to their applications in special purpose machine.

Use of solid lubricant in machine tool industry is one of the advanced technique nowadays. Merado, Poona under *CMERI* has done considerable amount of work on the selection of cutting fluids based on solid lubricants under different machining conditions. Molybdenum disulphide and graphite based lubricants were studied in evaluating their specific uses in different machining operations. At *CMERI*, Durgapur, at present work was being done to establish optimum values of essential parameters while using solid lubricants in metal forming operation such as extrusion.

An improved computational procedure for predicting flow field in an extrusion process has been developed. The capabilities of the technique have been demonstrated by predicting an experimental situation. More information about the distributions of stresses and strains could be obtained with little difficulty by using procedure developed as the calculations involved were inherent in the technique itself.

The tool life is a very important aspect of economic machining of metals. Arresting of tool wear is very much desired in any operation evaluaing performance in metal machining. Studies have been made to evaluate "thermoelectric wear" of carbide tools on a lathe machine. In this connection, the machine resistance in "Machine-Tool-Workpiece-Machine" system has also been measured. Minimisation of thermoelectric wear of the tool using compensating devices, such as (i) sending current equivalent to the magnitude of thermocurrent in the opposite direction and (ii) by insulating the tool with an isolator has been successfully effected. Machinability *i.e.* ease of machining a material, is very important in production engineering. The rating machinability of different materials are done by various methods.

Recently work has also been done in the field of surface topography—its stationarity and ergodicity based on various machining operation. Theoretical analysis has been done for finding out the plastics deformation of the asperities and their effect on contact compliance.

In view of the need and urgency of developing special purpose bearings for machine tool, high temperature and nuclear applications, as well as in cryogenic, a project on air bearing has also been initiated. Performance test of air bearings at a speed up to 30,000 rpm has been conducted in the laboratory with indigeneously developed air bearing supported radial air turbine serving as a drive unit. Various aspects of rotor techniques such as stiffness, damping and stability characteristics of externally pressurised air bearings have been investigated theoretically and experimental results compared favourably with the theoretical predictions. The Institute has also set up with variable speed and variable size journal bearing testing machine developed indigeneously with proper instrumentation to measure friction temperature and oil film, thickness in various conditions. The machine could be utilised to exactly simulate the tribo-system for industrial problems as well as to do the basic research under boundary, mixed film and full film lubrication zone.

The Institute has a plan to set up a laboratory so that it could cater mainly to the industrial needs of the country as well as fill up a long gap in application of tribological researches to industrial product design, maintenance and upkeep.

Rubber plantations in Konkan

KOTTAYAM

THE Rubber Research Institute of India has decided to take up trial plantation of rubber in the Konkan region of Maharashtra State. An area of 50 hectares belonging to the Dairy Project at Dapchari has been taken over for this. The land, allotted to the Rubber Board by Government of Maharashtra, is situated 150 km away from Bombay on the Bombay-Ahmedabad highway near Kurze dam at Dapchari Village. The proposed rubber plantations will be the Research-cum-Demonstration Centre exclusively for this region. The centre will study the specific problems relating to the agro-ecological conditions pertaining to the non-traditional tracts and will also assess the scope for large scale commercial cultivation of the para rubber trees (*Hevea brasiliencies*) which almost exclusively supply the world with natural rubber.

Mr P. Mukundan Menon, rubber production commissioner of the Rubber Board, Mr V. K. Bhaskaran Nair, director of research, Dr S. Narayanan Potti, deputy director, agronomy, and Mr P. J. George, botanist of the Institute, recently visited the area set apart for the centre along with the officials of Maharashtra Government. As the area selected for the centre gets only about four months rain, the period of drought is much prolonged which is not conducive for rubber cultivation. The centre will, therefore, try irrigation methods and the authorities of the Dairy Project Dapchari have offered all the facilities and co-operation to the Rubber Board. The Research Institute proposes to initiate steps to establish this centre immediately.

Viability of regional rural banks

Bombay

DESPITE the constraint of limited area of operation, an unhelpful topography and an unenterprising clientele, the regional rural banks (RRBs) have so far been able to achieve the main objective of helping the weaker sections of the community in the rural areas, namely, small and marginal farmers, landless agricultural labourers and rural artisans, by purveying credit to suit their requirements. This conclusion emerges from a study on the viability of RRBs undertaken by the Rural Planning and Credit Cell of the Reserve Bank of India. The study covers the working of 15 RRBs which had been in existence for three years, or which had attained a loan business of Rs 3 crores and above by the end of December 1978.

On an average, an RRB had (by the end of 1978) advanced directly a total loan of Rs 3.35 crores to about 42,000 borrowers at the rate of about Rs 800 per account, indicating thereby the preponderance of small borrowers. Out of the total borrowers, small/marginal farmers and landless agricultural labourers accounted for 70 per cent and rural artisans, retail traders and other unemployed persons for 25 per cent.

The 15 RRBs selected for the study had controlled their operating expenses quite efficiently. There was no doubt a rise in expenditure between 1976 and 1978, but this was due to increase in interest paid on deposits (from 6.7 per cent to 32.2 per cent) and interest on borrowings (from 20.0 per cent to 22.6 per cent) and not due to increase in establishment expenses. Actually, establishment expenses had declined from 73.3 per cent in 1976 to 45.2 per cent in 1978. The overall rate of growth in income was quite impressive. The gross income per RRB increased from barely Rs 3 lakhs in 1976 to Rs 40 lakhs in 1978.

The gap between income and expenditure of RRBs is quite small signifying that the RRBs are nearing the break-even point. With a view to ensuring that they now start building up reserves, they should aim at sufficiently high growth rate for their loan business. On an average, an RRB would require about six years and a network of 70 branches to become viable. For this it is necessary that it reaches an outstanding loan business of Rs 8 crores and also enjoys a margin of about 5 per cent as between its average borrowing and lending rates. It is not possible for all the branches to become viable, because some branches are located in centres where the potential is limited, while some branches cannot expand their business in view of keen competition from the branches of commercial and co-operative banks.

Although the RBI undertook the study to examine the financial viability of RRBs which had completed three years of operation and reached a loan business of Rs 3 crores, it points out that a three-year period is generally not sufficient for a credit institution to achieve viability particularly for a rural credit institution and more so for RRBs. For the RRBs have been operating with some serious constraints—lending only to weaker sections, charging lower rate of interest, opening branches in the remote rural areas and keeping up low-cost profile—as a result of which they do not have adequate staff required for project preparation to avail of refinance from the Agricultural Refinance and Development Corporation. The RRBs also suffer from a number of teething troubles including staff orientation for rural lending work. A reasonable period for reaching financial viability may have to be longer in the case of RRBs than for other banks, RBI study says.

Even after allowing for the above limitations, the findings of the study indicate that the performance of RRBs is encouraging.

Performance of financial and investment companies

Meanwhile, another study by RBI reveals that the working of 299 selected non-government, financial and investment companies other than banking and insurance companies (each having a paid-up capital of Rs 5 lakhs or above) showed an increase of 8.2 per cent in total income (to Rs 37.71 crores) for the year 1978-79 as compared with the previous year's income (Rs 34.86 crores). The increase in the income of investment holding companies from Rs 13.24 crores to Rs 15.89 crores during the year under review was noteworthy.

Out of the four groups of companies, investment holding companies and hire purchase finance companies recorded growth rates of 6.7 per cent and 7.2 per cent in the main income, respectively, during 1978-79, while trading in share companies and loan finance companies registered a decline of 7.2 per cent and 2.3 per cent, respectively. Total expenditure increased from Rs 18.07 crores in 1977-78 to Rs 19.08 crores in 1978-79, showing a rise of 5.6 per cent. This was due to a rise of 8.0 per cent in the 'remuneration to staff' and 13.6 per cent in 'other expenses'.

The year 1978-79 witnessed an increase of Rs 90 lakhs in operating profits whereas non-operating surplus increased by Rs 95 lakhs and retained profits increased by Rs 111 lakhs.

While the rate of return (as measured by the ratio of operating profits to total net assets) improved marginally from 5.6 per cent in 1977-78 to 5.7 per cent in 1978-79, the return on shareholders' equity (as measured by the ratio of profits after tax to net worth) improved from 7.3 per cent to 7.8 per cent. Out of the 299 financial and investment companies, 235 earned operating profits during 1978-79 as against 234 companies in the previous year.

The total net assets of the selected companies increased from Rs 262.04 crores in 1977-78 to Rs 276.22 crores in 1978-79. The share of owned funds on the liabilities side remained more or less steady at 56 per cent, while the share of borrowings declined from 31.0 per cent to 30.4 per cent.

The reliance of selected companies on external sources of finance (50.9 per cent) was marginally higher than on the internal sources of finance (49.1 per cent). Reserves and surplus were the main constituents of the internal sources. Whereas hire purchase finance companies relied heavily on external sources of finance, investment holding companies depended mainly on their internal sources.

ELECTRIC MOTORS

Need for standardised stampings

BOMBAY

THERE has been no respite to the electric motor industry from problems of raw materials, fiscal levies and so on and these appear to be compounding year by year if the presidential speech of Mr Vijay Bhangar at the 16th annual general meeting of the All India Electric Motor Manufacturers Association is any indication. He says, that full requirements of stampings from suppliers are rarely available and though the stamping manufacturers have been receptive to the problems of the electric motor units, especially those who are members of the association, he would like them to give priority to production of small scale stamping used by small and tiny sector units. At the same time stampings should be standardised and varieties of stampings reduced so as to bring about increased production of standard stampings.

Mr Bhangar has also decried different interpretations given to excise notifications by different collectorates. He points out that though electric motors are exempted from whole of excise duty up to Rs 7.5 lakhs if clearances during the year do not exceed Rs 30 lakhs, the excise collectorate in Kolhapur insists upon demanding excise duty on stators and rotors forming component parts of electric motors. Unless the Government rectifies such unreasonable interpretation, the concerned manufacturers would stand to lose heavily. Another lacuna pointed out by Mr Bhangar relates to the sales tax in Maharashtra. With the recent amendment to the act, the electric motor industry, instead of getting relief, finds it has to pay a higher sales tax of 8 per cent as against 2 per cent—almost 400 per cent increase—simply because electric motors used in agriculture have been shifted from Section C-I-12 to Section C-II-102. It is surprising that while the Government has been subsidising the farmers for inputs like fertilisers in order to keep agricultural costs below, it has chosen to make them pay more for their electric motors. It almost amounts to giving the farmer with one hand and taking away from him with another, Mr Bhangar says.

BUSINESS OPINION

JRD on Steel Development Fund

MR J. R. D. Tata, chairman, The Tata Iron and Steel Company Ltd : "The method by which from April 1979 the Government compensated the main producers for increases in costs of controlled categories of steel by payments from the Steel Development Fund (SDF) based on each plant's own cost escalations caused us much concern, for it infringed the principle of price uniformity within the industry which had been accepted without interruption for decades. Such a system is unfair to those who, at considerable expense of money, effort and ingenuity, manage to keep their cost increases to the minimum, while it removes all incentive for further effort in that most desirable direction…

"At the date of this report, the situation in regard to the Steel Development Fund is still not clear. As shareholders are aware, the Government had announced on the 9th of February this year, an increase of 20 per cent in the prices of all price-controlled categories of steel to be paid in toto into the Fund. However, subsequent to the decontrol of billets, bars and rods on 24th February, the Government decided in June 1981 that the scheme of contributions to the Fund as per the February announcement would apply only up to March 31. Notwithstanding unconfirmed press reports, decisions whether the SDF is henceforth to be used exclusively for financing modernisation or also for the payment of compensation for cost increases, and as to the amount of contributions to the Fund and the categories on which they are to be made from April 1, 1981, are still to be announced.

"I hope that in formulating the final scheme of things, the SDF will be reserved exclusively for financing modernisation and consequential minor expansion, and not for meeting cost escalations. In regard to the latter, so far as decontrolled categories of steel are concerned, the producers should normally look to market forces and their own efficiency and cost competitiveness. If the Government were at any time satisfied that imports of steel were taking place at uneconomically low prices amounting to dumping, they should, as in the past, resort temporarily to protective import duties. In the case of those categories of steel which continue to be price controlled in the public interest, the Government should increase such controlled prices from time to time to meet legitimate and unavoidable increases in costs. Such increases should be approved after only summary investigations of costs to avoid the long delays, costly to the producers, which invariably took place in the past.

"An issue of particular importance to the integrated plants, including ours, concerns the terms on which loans are to be made from the SDF against approved modernisation programmes. We have represented to the Government that, as the accretions to the Fund will come from the amounts collected by the main producers, they should be lent back to them at a concessional rate of interest and not as announced at the rate charged by the financial institutions for commercial loans. As the Company's argument has not been accepted up to now, a further representation has been made urging reconsideration on the additional grounds, amongst others, that the funds to be lent will have cost the Government nothing to raise and that the higher rate of interest will increase the cost of modernisation, by about 15 per cent even after allowing for tax relief.

"We have also urged that even though it may not be specially laid down in the SDF scheme, the amount loaned to each plant over the years should in practice bear a reasonable relation to the amount it had contributed to the Fund. Finally, we have also asked that the integrated steel producers should be represented on the Committee administering the Fund, or, if that is not possible, that at least the views of the main producers should be taken into account in its administration and in the grant of loans."

British Asians demand full citizenship rights in the UK

From PAVAN SHARMA

NAIROBI

MR Romesh Desai, chairman of the Hindu Council of Kenya, who had been sent to the UK to express concern over the nationality bill, has released the following summary of a 36-page memorandum submitted to British parliamentarians on behalf of the British subjects living in Kenya. He was accompanied by Mrs Kusum Shah, Secretary of the council, during this trip, The summary reads as follows :

Since the British Nationality Act of 1948, various immigration/nationality laws or amendments thereto have been passed, gradually curtailing the rights of British subjects—citizens of UK and colonies, living outside Britain.

The current Nationality Bill amounts to paper genocide of these people who through no fault of theirs, stand to lose all their rights if the bill in its original form becomes law. The proposed Nationality Bill provides for three categories of citizenship:

I. *British citizens* : Those who or whose parents were born, adopted, naturalised or registered in the UK. In addition, it will also include those British subjects who have been residing in Britain, free of conditions, for a period of five years.

II. *Citizens of British dependant territories* : This category will include people who are citizens of the UK and colonies by reason of their parents' or their grandparents' birth, naturalisation or registration in an existing British, dependency or associated state.

III. *British overseas citizens* : The people falling in this category are mainly those who were born in countries which were then part of the British Empire or who had resided in such countries for a long period; thus their British citizenship was derived by virtue of their birth or registration in former British colonies or dependencies.

The British overseas citizens (BOC) will not be able to transmit their children. They will have BOC passports issued to them and would be entitled to British consular protection. They cannot enter Britain or an existing British dependency to settle.

As regards this third category of BOC we wish to submit as follows :

1. Suddenly and abruptly "depriving" these British subjects of their citizenship as secured under the 1948 Nationality Act who have no other citizenship and no country—to go to, would be unjust and unfair. They retained their British citizenship when they had an option to choose another, in the hope and in the best of faith that Britain will look after them. Therefore all British subjects from former colonies and dependencies should be included in the new classification of 'British citizens' as provided for in the Bill.

2. Furthermore, there should be a written assurance by the government that there would be a settlement voucher available for all the people falling in this category who are presently residing outside Britain and issued to them whenever needed. A majority of all those concerned are either professionals or highly skilled British citizens employed outside UK. These people should be reassured and be given right of entry into the UK when applied for, over the counter. They could then come gradually, at their convenience to the UK and be absorbed into UK's mainstream.

3. The total number in Kenya of people eligible for vouchers is estimated in the region of 17,000. But we feel that this is grossly exaggerated. We suggest a census be conducted by the British High Commission in Nairobi to establish a near-accurate figure which in our opinion would not exceed 10,000. There may not be more than 2,500 heads of household eligible for a voucher for settlement.

4. Those British subjects who are eligible for settlement in the UK would not come here all at one time but would come when it is convenient for them to do so, that is, when their work permits or trading licences have expired, and they are placed in a position whereby they can no longer earn a living in their country of adoption, they would bring their savings and other finances which they are permitted to bring. They should be allowed to a voucher over the counter by the British High Commission in Nairobi.

If on the other hand, they were made to wait in a queue, they would be forced to use up their available financial savings and resources and finally they would enter the country penniless and with a lot of mental stress; people entering in such a state would naturally ask for and expect monetary assistance from the government's welfare scheme. Apart from the drain on public funds, such a state of affairs, would not be conducive to good community relations.

5. The non-white British subjects who originally came to East Africa did so at the instance of and at the invitation of then ruling authorities in Britain, to work for them. These people then gave loyal services to the British Empire by laying the railway lines and by working in the banks, finance houses, government offices, railways, insurance companies, professional companies etc. They helped in the development of these former colonies by opening up shops, boarding houses etc. In the lonely and absolutely undeveloped hinterland. The loyal and faithful service rendered to the British Empire by the pioneers of the present generation has never been given due recognition. These British subjects (born or registered as citizens of UK and colonies), when given the choice of the citizenship of their adopted country or the UK, opted for the British citizenship. As such, these people hold no other citizenship and have nowhere to go. This act alone speak for the loyalty of such people to Britain.

Successive British governments, while giving verbal assurances, have curtailed their rights. Britain should once and for all recognise its responsibility to and honour obligations to all those British subjects holding citizenship of the UK and colonies whether in Kenya, India, or Zambia and give them full citizenship rights.

6. At present there is no right of appeal under the voucher system against refusal of a voucher to the head of household or an entry certificate to his dependant. This should be introduced so that if the applicant feels he has been unjustly refused an entry certificate for settlement, he may be in a position to appeal and be heard by a judicial forum.

7. In the proposed law a lot of discretion has been vested in the Secretary of State which in effect and for practical purposes means that civil servants have been given a lot of arbitrary powers and they have the final say. We strongly feel that these powers should be curtailed and also that appeals be allowed against decisions of refusals to issue passports entry certificates, etc. A set system for issuing of entry certificates and passports should be devised setting out all requirements. The applicant on refusal should be given reasons for such refusal if he wishes to know them.

8. 'Close links' or 'close ties' with

the UK is a very debatable and arguable phrase. Those people who are settled in Australia, Canada etc have a connection, to the extent that their ancestors were born here. These people may have no relatives at all in Britain and no other ties whatsoever. They may not wish to ever come to Britain or to reclaim their British Nationality. On the other hand, most of the British subjects residing in East Africa (of Asiatic stock) have relatives settled here. They are loyal to the country. Their thinking and style of living is geared to that prevailing in Britain. We feel that people in the latter category have stronger ties or links with the UK than of those in the earlier category who have no connections with this country whatsoever.

9. Section 65 (3)/(2) of British Nationality Act 1948, provides for 'deprivation' or citizenship from people whose conduct is damaging to the security of the country or is not conducive to public good. The behaviour or conduct of British subjects living in East Africa has not been such as to justify deprivation of their previously conferred and confirmed rights; there is no justification at all for usurping their rights from the people concerned.

10. We feel that the new act should contain the civic rights of people who have already settled here and of those who will in future be settled here; the rights, duties, responsibilities and obligations conferred by the state upon the citizens as well as what and how much the state anticipates or expects from them must be clearly spelled out.

Adequate power for APPLE

SIR,—I was pained to see Dr V. S. Venkatavaradan's article "Snags in space research" appearing in *Commerce* dated July 4, 1981.

As all our press releases have repeatedly stated, even without the deployment of the north side solar panel, we have more than adequate power to run the entire *APPLE* mission. In fact the power obtained from the south side deployed solar panel and the partial power from the undeployed panel is at least 30 watts more than what we need. We had also stated that the sizing of the power panel was based on the transfer orbit requirements during which both panels are supposed to be in the stowed configuration. I had also made it clear that the effect on the non-deployed panel was essentially to make it difficult for us to achieve the three axis stabilisation due to the imbalance introduced into the configuration and the occultation of one of the sun sensors. However, contingency methods exists through which the three axis stabilisation was successfully achieved.

The statement that the satellite could not be accurately positioned is a patently false statement. Every manoeuvre carried out in *APPLE* is standard manoeuvre required for all similar communication satellites. These include:

(a) Spinning the satellite, orienting it in the right direction and firing the ABM;

(b) Despinning of the satellite and deployment of the solar panels.

(c) Achieve the three-axis stabilisation after acquiring sun, enabling solar panels to track the sun, again orienting the spacecraft and then acquiring the earth. In this mode with jets controlling the three axis stabilisation, start the momentum wheel and finally transfer the stabilisation to the wheel.

(d) Raise the perigee further by firing hydrazine thrusters to circularise the orbit and achieve almost 24 hours drift orbit.

(e) Finally provide a slow drift to move the satellite to its intended position, apply drift correction to stop the drift and achieve exact 23 hour, 56 minutes 4.1 second orbit.

It is customary to provide a slow drift of 1 to 2° per day in the drift orbit, to reduce fuel consumption. Higher drift rate would require higher correction to stop the drift (well known Newton's third law of motion) and this will involve unnecessary consumption of fuel. Infact, *INSAT* will use a drift rate of about 1° per day.

All the above manoeuvres are standard ones used for all geosynchronous satellites carrying solid apogee motors and part of the mission operation procedures. These manoeuvres generally take about 30-45 days depending on optimisation requirements in each case. *METEOSAT*, our co-passenger is still in the drift orbit and will arrive on position only by about 25th of this month.

Regarding hydrazine fuel, we had 42 kg fuel, of which approximately 32-35 kg was earmarked for orbit raising and 7-10 kg for station keeping to provide service for a minimum period of one year. The small uncertainty is essentially due to 3 sigma dispersion errors which could be encountered in the behaviour of the parent rocket and the apogee motor. As predicted, we have consumed approximately 34 kg fuel for orbit raising and orbit manoeuvres, with a balance of about 8 kg left for station keeping, which is adequate for one year life mission. It may be noted that approximately 1.5 gm of fuel per day is all that is needed for East-West station keeping which means for East-West station keeping alone we need only 1 kg of fuel per year. However, North-South station keeping manoeuvre requires slightly larger amount and the most conservative estimate is that *APPLE* will have at least an year's mission life, as set forth. For your information, comparative figure for *INSAT* station keeping (which is a much heavier satellite) is about 10 kg per year.

Even though, the non-deployment of one panel is essentially academic as far as *APPLE* mission is concerned, efforts are on to simulate the conditions on the ground and understand the nature of the problem. However, we will make further attempts to deploy the north side solar panel only when temperature on the hinges of the panel is favourable and bulk of the mission is accomplished. I hope you will realise that when *APPLE* mission is comfortable, it is not wise to disturb the satellite on a problem which is academic, as far as the mission is concerned. The mission operations have strictly followed the laid down procedures with a mathematical precision and the fully stabilised, operating spacecraft has been stationed at its parking place exactly as per the procedure.

Incidentally, the payloads have also been checked out and TV transmission has also been carried out which shows excellent performance of the spacecraft.

U. R. Rao
Director, ISRO Satellite Centre,
Bangalore.
July 17, 1981

Dr V. S. Venkatavaradan writes:—

Prof U. R. Rao has taken objection to only one point among the six snags I have pointed out in my article. I presume that he agrees with all the other points that I have made.

In reference to *APPLE*, I have mentioned that one of the solar panels did not open up, thereby reducing the available power. Even though it is possible to operate the satellite with only one solar panel, the fact remains that it can be operated only for a limited duration of eight hours instead of all the 24 hours as originally planned. Non opening of the solar panel is a major snag in the *APPLE* programme.

About the point regarding hydrazine, whatever I have stated about the hydrazine consumption is valid—if lot of hydrazine is spent in manoeuvres, the operational life time of the satellite will be greatly reduced. This is evident from the fact that the ISRO, which had announced that the satellite will be operable for two years, is now quoting the figure of only one year. It is fortunate that enough hydrazine is left with the satellite to operate it atleast for one year. A UNI report from Sriharikota (June 25) also confirms the delicate situation which the satellite faced regarding hydrazine.

CORPORATE SECTOR

In the market

Sunil Synchem

Sunil Synchem Ltd (Registered office: 17/18, Old Industrial Area, Alwar 301 001, Rajasthan) is offering for public subscription at par 2 lakh equity shares of Rs 10 each totalling Rs 20 lakhs. The subscription list opened on July 27 and will close on August 6.

The company was incorporated as a public limited company in February 1973 for the manufacture of empty hard-shell gelatine capsules. It has undertaken a project to fabricate/assemble two automatic capsule making machines to increase its installed capacity from 400 million to 800 million capsules per annum. The company has obtained an industrial licence to manufacture 24 tonnes per annum of L-methyldopa, a basic drug used for the treatment of hypertension.

Agarwal Bolts

Agarwal Bolts Ltd (Registered office: 25, Strand Road, Calcutta 700 001) is offering for public subscription at par 19,500 equity share of Rs 10 each totalling Rs 1.95 lakhs. Apart from this 10,500 equity shares of Rs 10 each at par totallling Rs 1.05 lakhs are offered for sale. The subscription list for the new equity shares as well as the application list for the equity shares offered for sale opened on July 27 and will close on August 6. The company was incorporated as a private limited company in 1971 and was converted into a public limited company in August 1980. It is licensed to manufacture 3,200 tonnes of bolts, nuts and rivets per annum.

Other developments

Indian Rayon steps up

The Indian Rayon Corporation Ltd, a multi-division company having its units in Gujarat and West Bengal, has stepped up its dividend from 15 per cent to 16 per cent for the year ended June 30, 1981. The previous year's dividend was on an enhanced capital resulting from a 1 : 4 bonus issue. The company could pay higher dividends because the disposable profits, after making lower tax provisions for 1980-81 and after writing back excess tax provisions and development rebate reserves relating to prior periods no longer required, were higher at Rs 7.05 crores as compared with Rs 4.07 crores in 1979-80. The stepping up of dividend was also a prelude to the proposed issue of non-convertible secured debentures. While releasing the working results of the company for the year 1980-81, Mr B. L. Shah, a senior director, has remarked that dividends have been stepped up also to meet the rising expectations of the shareholders of the company.

The turnover of the company for the year 1980-81 was marginally higher at Rs 61.70 crores as compared with Rs 60.53 crores during the previous year. Mr Shah claimed that but for the three and half months' strike at the Rishra units and the two and a half months' strike and lockout at the Veraval unit, the results could have been much better. Gross profit for the year at Rs 8.68 crores was 6 per cent lower than that of Rs 9.25 crores earned during 1979-80. After providing for depreciation Rs 1.94 crores (Rs 1.45 crores) and taxation Rs 2.00 crores (Rs 3.80 crores) and writing back excess provision for taxation and development rebate reserve no longer required amounting to Rs 0.91 crore and Rs 1.40 crores respectively (nil and Rs 0.07 crore respectively during the previous year), total disposable profits amounted to Rs 7.05 crores (Rs 4.07 crores). The company transferred Rs 0.15 crore (negligible) and Rs 1.63 crores (Rs 0.43 crores) respectively to capital redemption reserve and investment allowance reserve respectively. Proposed dividends would absorb Rs 0.82 crore (Rs 0.79 crore) leaving Rs 4.45 crores (Rs 2.85 crores) for transfer to general reserve. Mr Shah expected the company's sales turnover to reach the level of Rs 85 crores during 1981-82.

The company has various projects for expansion and diversification on hand, the mplementation of which would cost about Rs 70 crores. About Rs 10 crores have already been spent on the projects. The projects under various stages of implementation include increasing the capacity of viscose filament rayon yarn to 7,300 tonnes and carbon-di-sulphide to 2,750 tonnes, Rishra insulator expansion to step up the capacity for manufacture of high rated bushings and insulators by 3,200 tonnes, Halol insulator unit to manufacture high rated bushings, etc, a portland cement plant with a capacity of 5.40 lakh tonnes in Karnataka, expansion of the spinning unit at Midnapur and a project for the production of high tension transmission and sub-station equipments.

The company has proposed to issue non-convertible secured debentures of Rs 5 crores for meeting its increasing working capital requirements. The debentures will carry 13.5 per cent interest and will also be entitled to an additional interest of one per cent per annum if the company declares equity dividend exceeding 14 per cent for the immediately preceding year. The company has received the consent from the Controller of Capital Issues for the issue of the debentures. The debentures will provide for a buy back facility at par to the extent of Rs 25 lakhs in one accounting year.

Chowgule Steamships: Impressive results

Chowgule Steamships Ltd by declaring a dividend of 15 per cent for the year ended March 1981 has returned to the dividend list after a lapse of three years. The last dividend paid by the company was at 10 per cent for the year ended March 1977. The improved working results have enabled the company to wipe out the entire arrears of preference dividend for the years 1977-78, 1978-79 and 1979-80 amounting to Rs 8.55 lakhs. The company is going ahead with a huge expansion programme.

The company has reported higher income from freight earnings and charter hire receipts for the year ended March 1981 at Rs 17.61 crores compared to Rs 14.76 crores in the previous year. The net profit after providing Rs 3.28 crores (same) for depreciation was Rs 5.99 crores (Rs 1.92 crores). The equity dividend recommended absorbed Rs 114.98 lakhs (nil) and preference dividend Rs 11.40 lakhs (nil). An amount of Rs 3.15 crores (nil) is transferred to development rebate reserve and Rs 45 lakhs (nil) to statutory reserve.

The company's fleet at present comprises 5 bulk carriers totalling 269,654 dwt. The company is now proceeding with a large expansion programme involving an outlay of Rs 170 crores. One 75,000 dwt bulk carrier is already under construction at Cochin Shipyard Ltd. Another two ships of the same size also have been ordered with Cochin Shipyard. These three ships are likely to be delivered in 1983, 1984 and 1985 respectively. The company has also finalised negotiations for purchase of two container oriented bulk carriers of 35,000 dwt each with Japanese shipyard at a cost of 4,930 million yen per vessel. These ships are to be delivered in first and second quarter of 1984. These ships are container oriented with a capacity to carry 690 containers with 25 tonnes crane which are also suitably equipped for grab. The company is also negotiating for four second hand vessels of about 4,000 dwt each at a total cost of Rs 10 crores for use in coastal shipping. The company is arranging necessary bank guarantee from a foreign bank. The rupee loan to the extent of 90 per cent of the cost of expansion is expected to come from the Shipping Development Fund Committee. The balance of rupee funds will come from the company's own resources.

Star Textiles: Debenture issue proposed

Star Textile Engineering Works Ltd has enhanced the dividend rate from 15 per cent to 18 per cent for the year ended March 31, 1981 on the expanded equity capital resulting from 2:5 bonus issue during the year. It has also proposed to issue secured convertible debentures of the face value of Rs 4 crores to finance new projects for diversification and expansion. These announcements were made by Mr Suresh Mehta, chairman and managing director of the company, at a press conference in Bombay immediately after the meeting of the board of directors of the company.

The sales turnover of the company has increased from Rs 13.43 crores for the year ended March 31, 1980 to Rs 18.71 crores for the year ended March 31, 1981. This includes other income earned by the company amounting to Rs 2.28 crores (Rs 2.39 crores in the previous year). Export earnings during the year were Rs 3.1 crores including Rs 38 lakhs against technical knowhow and consultancy fees, a large part of which was tax-free. The gross profit has increased to Rs 1.98 crores from Rs 1.56 crores during the previous year. After providing for depreciation Rs 42 lakhs (Rs 24 lakhs), taxation Rs 62 lakhs (Rs 59 lakhs) and deductions for adjustments relating to previous years Rs 1.55 lakhs (Rs 5.38 lakhs), the net profit earned by the company has amounted to Rs 93 lakhs (Rs 67 lakhs). After transferring Rs 11 lakhs (Rs 4 lakhs) to investment allowance reserve, the profit available for distribution for the year ended March 31, 1981 has been Rs 82 lakhs (Rs 63 lakhs). The dividend recommended would absorb Rs 25 lakhs (Rs 14 lakhs) leaving Rs 57 lakhs (Rs 49 lakhs) for retention.

In view of the new projects being undertaken by the company, the directors have decided to augment the long-term resources required for the projects by recommending the issue of secured convertible debentures of the value of about Rs 4 crores. The debenture issue is expected to be made in the next six months or so and the conversion will be up to 40 per cent in two stages at a premium ranging from Rs 5 and Rs 7.50 subject to the approval of Controller of Capital Issues.

The total cost of the new projects envisaged in relation to this debenture issue is around Rs 10 crores and would include a textile spinning project at Ratnagiri at a cost of Rs 6.75 crores, a foundry project of Rs 3 crores and a project for the manufacture of dryers valued at Rs 20 lakhs. The spinning mill project would be for cotton, man-made and blended fibres, partially for the domestic market and partially for exports. The project would employ the latest technology in both ring spinning and open-end spinning and would manufacture specialis-

Jumbo size container

The American President Lines is now offering jumbo 45-foot container, the first of its kind, as against the conventional 40-foot container, according to Mr E. N. Palia, a representative of Forbes Forbes Cambell & Co Ltd., local agents of American President Lines. The new container will have a cargo capacity of 3,035 cubic feet representing a 27 per cent increase over the conventional containers.

The dimensions of the new container are 9' x 6½'. In the light of the fact that handling and transportation costs are determined on a unit basis, the new container inasmuch as it has an additional 27 per cent cargo capacity will yield a significant cost advantage to users.

Initially, the 45′ container will be designated for on-deck stowage only and will go into service to haul less than container load (LCL cargo) between major Asian ports and North Eastern US destinations. At a later stage APL's 45-footers will be deployed on selected inter-model routes resulting in improved operational efficiency. Pilot runs of the 45′ container have already commenced on a series of trans-pacific crossings to familiarise the land operational personnel and the crew of its working.

Constructed out of aluminium with steel frames, the improved containers are designed for a payload of 54,300 lb and can be operated on inter-state highways with a load bearing capacity of 50,000 lb.

ed high quality yarns including industrial yarns. The foundry project would be for manufacturing high quality castings mainly for captive consumption. as well as meeting the growing needs of associate concerns. The foundry would be located either at Dharwar, Karnataka or in Ratnagiri. The manufacture of dryers is for captive requirements of rotary and flat bed screen printing machines to achieve self-sufficiency.

The turnover during the year 1981-82 up to June 30, 1981 has been of the order of Rs 3 crores. According to Mr Mehta, the sales turnover for the current year is expected to exceed Rs 21 crores.

Indian Oxygen: 9 per cent interim

Sales of Indian Oxygen Ltd for the half-year ended March 1981 amounted to Rs 35.77 crores compared to Rs 28.55 crores for the half-year ended March 1980. The net profit, after providing Rs 66 lakhs (Rs 63 lakhs) for depreciation, Rs 73 lakhs (Rs 72 lakhs) for interest payments and Rs 2.26 crores (Rs 99 lakhs) for taxation, was Rs 1.48 crores (Rs 67 lakhs). The interim dividend recommended is 9 per cent.

Amar Dye-Chem: Turnover down

The sales turnover of Amar Dye-Chem Ltd declined by 7.6 per cent from Rs 30.91 crores during 1979 to Rs 28.56 crores in 1980. Reportedly due to heavy cost excalations, the gross profit during the year slumped by 47.7 per cent to Rs 1.50 crores from Rs 2.88 crores in the previous year. The company maintained the equity dividend at 12 per cent for the year 1980—the silver jubilee year of the company. At the recent annual general meeting of the company, the chairman, Mr J. H. Doshi, informed the shareholders that during the first five months of 1981 the company's turnover was slightly higher at Rs 9.80 crores (Rs 9.77 crores). However, he was doubtful whether this improvement could be sustained since the textile industry, the main consumer of dyestuffs, was not expected to do well. On the export front, the exports during 1980 (including those of its wholly-owned subsidiary) exceeded those in previous year by over Rs 6 crores.

The company had decided to instal a coal-fired boiler to save fuel cost up to Rs 37 lakhs annually but since the delivery of the boiler was delayed this fuel reduction could not be effected.

The company has plans to put up a plant for the manufacture of basic chemicals such as ortho nitro chloro benzene (which would provide base for intermediates), jointly with the West Bengal Industrial Development Corporation. The project is estimated to cost Rs 7 crores to Rs 8 crores and a company, namely "Eastern Organics Ltd" with an initial capital of Rs 5 crores, has already been registered. The paid-up capital of the new company would be Rs 2.5 crores to Rs 3 crores, of which Amar Dye-Chem Ltd has agreed to provide 25 per cent.

Indian Dyestuff maintains

Indian Dyestuff Industries Ltd has reported higher sales for the year ended March 1981 at Rs 57.63 crores compared to Rs 54.25 crores in the previous year. The net profit, after providing Rs 1.99 crores (Rs 1.87 crores) for depreciation and making no provision for taxation (Rs 0.75 lakhs), amounted to Rs 1.67 crores (Rs 2.27 crores). The equity dividend recommended for the year under review is 13 per cent (same). An amount of Rs 59 lakhs (Rs 87 lakhs) is transferred to investment allowance reserve and Rs 6.70 lakhs (Rs 7.50 lakhs) to general reserve.

Hindoostan Spinning: Modernisation apace

Turnover of the Hindoostan Spg & Wvg Mills Ltd for the year ended March 1981 increased to Rs 71.56 crores from Rs 60.18 crores in the previous year. The net profit, after providing Rs 1.02 crores (Rs 85.70 lakhs) for depreciation, was Rs 1.90 crores (Rs 2.66 crores). The equity dividend recommended for the year under review is 12 per cent (10 per cent). An amount of Rs 26.60 lakhs (nil) is transferred to development rebate reserve and Rs 88.40 lakhs (nil) to investment allowance reserve. Exports during the year under review were Rs 13.19 crores (Rs 12.80 crores).

The first phase of the company's modernisation programme has been completed with the installation of new machinery worth Rs 2.34 crores during the year under review. The company is now taking up is second

---

Auto Tractors goes into production

The Auto Tractors Limited, a State Government undertaking at Pratapgarh (PU), set up at a cost of Rs 18.86 crores, has gone into production. The programme envisages manufacture of 500 tractors during the current financial year which is expected to be increased to 6,000 numbers by 1986. UP's Industries Minister, Mr Niaz Hasan, who rolled out the first two tractors manufactured by ATL on July 3, told *Commerce* that a new programme costing Rs 10 crores would be taken up for production of 15,000 sets of engines and light commercial vehicles under a new sub-project of ATL. It is proposed to increase the initial capacity of 200 engines to 2,000 by 1986. The designing and development work of the new sub-project for production of engines and light commercial vehicles is expected to be completed in two years. The first model of the engine is likely to be ready by June 1984.

With the commissioning of the Pratapgarh project, Leyland 154—the powerful 28 bhp tractor of British Leyland, UK—is now being manufactured in India as Pratap-284 by ATL.

modernisation programme involving an outlay of Rs 5.51 crores.

Fouress bags an order worth one crore

Fouress Engineering (India) Pvt Ltd, the leading manufacturers of industrial valves in the country has just bagged an order valued at £490,186 for the supply of 54 Fouress-Metroflex Gas Tight Isolators for Ramagundam thermal power station, Andhra Pradesh, from Ansaloo, Italy, against stiff global competition.

This is deemed as an export order and with the cash subsidies and incentives the order is worth nearly rupees one crore. This is inded a major breakthrough for the company in the field of gas tight isolators.

Metroflex is a flexible sealing technology primarily used in gas tight isolators having a wide application in large industrial plants such as steel works, power stations, cement works etc without having to shut down the main process.

As this technology is relatively new to India, Fouress entered into technical collaboration with M/s Metroflex Grossventilbau AG, Switzerland for the manufacture of these gas tight isolators in this country.

The execution of this present order will enable the country to save precious foreign exchange amounting to half a million pound sterling.

National Insulated Cable: Higher revenue

National Insulated Cable Company of India Ltd has reported higher revenue for the year ended April 1981 at Rs 17.36 crores compared to Rs 14.14 crores in the previous year. The net profit, after providing Rs 25.44 lakhs for depreciation and Rs 44.53 lakhs for taxation, was Rs 50.50 lakhs. The equity dividend recommended for the year under review is 12 per cent (10 per cent). An amount of Rs 8.77 lakhs is transferred to investment allowance reserve and Rs 17.48 lakhs to general reserve. The company's diversification programmes have been progressing well. Furmanite Nicco Ltd commenced commercial operations in November 1980. It has earned a gross profit of Rs 8.16 lakhs for the period ended April 1981.

The Naini Tal Bank Ltd: Deposits increase

Total deposits of the Naini Tal Bank Limited increased to Rs 14.09 crores as on December 31, 1980 as against Rs 10.27 crores as on December 31, 1979 registering a growth of about 37 per cent. The average deposit per branch increased to Rs 54.21 lakhs as against Rs 46.68 lakhs last year. Credit expanded marginally to Rs 6.08 crores as on December 31, 1980 from Rs 5.97 crores as at the end of the previous year. The bank's priority sector advances continued to constitute 51 per cent of total advances. The bank's net profit after all provisions and taxes stood at Rs 3.73 lakhs for 1980 as against Rs 3.01 lakhs in 1979. The bank proposed to maintain the dividend at 10 per cent for 1980. The bank opened four new branches during 1980, all in Uttar Pradesh, raising the number of branches to 26.

R. B. Rodda: Higher sales

R. B. Rodda & Co Ltd has reported higher sales for the year ended March 1981 at Rs 13.66 crores compared to Rs 13.12 crores in the previous year. The net profit, after providing Rs 63.61 lakhs (Rs 48.21 lakhs) for depreciation, was Rs 41.83 lakhs (Rs 34.06 lakhs). The dividend absorbed Rs 1.56 lakhs (same). An amount of Rs 32 lakhs (Rs 33.80 lakhs) is transferred to investment allowance reserve and Rs 8.50 lakhs to general reserve.

Transpek Industry to expand

The sales of Transpek Industry Limited, Baroda, for the first five months of 1980 have gone up by 31 per cent and reached a new level of Rs 1.74 crores as against Rs 1.33 crores for the corresponding period of the previous year. The company is planning to expand the present capacity of thionyl chloride from 450 tonnes to 1,200 tonnes. The production of thionyl chloride has gone up in the current year. The company has also developed new products in its R & D department such as sulphur di-chloride, 2-dimethyl amino ethyl chloride, hydrochloride and other pharmaceutical and chemical intermediates. The company will very shortly approach the licensing authorities for putting up a commercial plant—for the above products.

English Electric: Higher sales

Sales of the English Electric Company of India Ltd for the year ended March 1981 increased to Rs 29.04 crores from Rs 24.38 crores in the previous year. The net profit, after providing Rs 4.42 crores (Rs 3.65 crores) for taxation, was Rs 1.93 crores (Rs 1.65 crores). The equity dividend recommended for the year under review is 25 per cent. An amount of Rs 14.14 lakhs (Rs 5.36 lakhs) is transferred to investment allowance reserve and Rs 66.64 lakhs (Rs 61.05 lakhs) to general reserve.

Forthcoming company meetings

PUBLIC SECTOR

Hindustan Cables poised for major expansion

Hindustan Cables Ltd (HCL) has two factories, one at Rupnarainpur and other at Hyderabad having a total production capacity of about 28 lakh conductor kilometres (CKM) of jelly filled cables. The company manufactured 18.73 lakh CKM of jelly-filled cables during 1980-81. To meet the growing demand of the Posts and Telegraphs Department for telephone cables and also to keep pace with advanced technology, HCL has embarked upon a major expansion programme. There are two on-going projects at Rupnarainpur, one for creating additional capacity of 6 lakh CKM of jelly-filled cables and the other a replacement and modernisation programme involving a capital investment of Rs 9.75 crores, which would generate an additional capacity of 8 lakh CKM. Besides, a proposal for balancing equipment at a capital outlay of Rs 2 crores to generate an aggregate additional capacity of 2 lakh CKM at both the factories awaits Government consent.

Moreover, under the Sixth Plan, a project for the creation of an additional capacity of 30 lakh CKM of jelly-filled cables at Hyderabad costing about Rs 50 crores has been accepted in principle by the Public Investment Board. The foreign exchange component of the project amounting to $25.5 million (about Rs 21.98 crores) will be loaned by the World Bank. The project for establishing a R & D unit for HCL at Hyderabad with a capital investment of Rs 4 crores and a recurring expenditure of Rs 90 lakhs per annum has already been cleared by the Government.

The completion of the on-going and new schemes under the Sixth Plan will generate an additional capacity of 44 lakh CKM of dry core cables (including jelly-filled) and 2,000 tube kilometres (TKM) of co-axial 174 type at a total investment of about Rs 95 crores. Completion of these schemes is expected to generate an additional turnover of Rs 115 crores, an additional profit of Rs 10 crores and additional employment to 2,500 employees.

Dalal Street resumes on promising note

Bombay, July 27

Dalal Street began humming with activity again on July 21 when trading was resumed after the suspension of operations since June 26. The market was, however, open in the intervening period on July 2 and July 17 for the limited purpose of squaring-up of outstanding business. Equity prices were marked up sharply on frantic short-covering and bull grip. Shares, however, reacted towards the end of the week. Activity was large and the undertone at the close of the week was steady-to-better.

The initial firmness was attributed to the withdrawal of the earlier restrictions imposed on 'A' group shares and encouraging bonus issue announcements. The drop in later dealings was in the nature of a technical reaction. The BSE authorities have, however, imposed fresh restrictions on 10 volatile scrips to curb excessive speculative business. Operators have to pay daily margins at the rate of 3 per cent in the case of 10 scrips.

This apart, brokers have to file a daily statement of their business in 10 scrips and pay additional special margins as per the rules laid down. Members have also been warned against excessive speculative trading. If they do so, the authorities will impose new heavy margins on those members violating the rules. Free trading without any restrictions has been allowed in the remaining shares in 'A' group as well as in 'B' group.

The restricted scrips, with minimum margins in bracket, are Century (Rs 20), Tata Steel (Rs 10), Baroda Rayon (Rs 10), Hindustan Motors (Re 1), Gwalior Rayon (Rs 2), Premier Automobiles (Rs 7), Reliance (Rs 3), Hindustan Aluminium (Rs 2), TELCO (Rs 15) and Great Eastern Shipping (Rs 2).

Century opened strong at Rs 821 and rallied further to Rs 853 before closing at Rs 816, with a net gain of Rs 27. The profit-taking at the improved rates was attributed to labour unrest at the company's Kalyan plant. Tata Steel spurted from Rs 298 to Rs to 361 before reacting to Rs 345.50. ACC reacted from the week's high at Rs 208 to Rs 178 because the increase in retention price by Rs 34.74 per tonne fell short of the industry's expectations.

(a) An asterisk mark after the quotation indicates the closing prices of the last official trading and not of the date indicated in the columns

(b) The dash (—) in the columns for 'High' and 'Low' means that no official trading in the share had taken place during the period under report ** During the week ended July 18, 1981 the bombay stock Exchange remained open for trading only on July 17. The just normal trading was on June 26, after which the market was open on July 2 and July 17 for squaring - up of outstanding business.

Market Gossip

Modi Rubber's take-over of Bombay Tyres

THE Government has approved the take-over of Bombay Tyres International Ltd, formerly known as Firestone Tyre & Rubber Co of India Private Ltd, by Modi Rubber Ltd. According to the original deal finalised in early 1980 between Modi Rubber Ltd and Firestone Tire & Rubber Company of Akron, USA, the entire shareholding of the US company in Bombay Tyres amounting to 33.30 lakh equity shares of Rs 10 each would be transferred at par to Modi Rubber. Bombay Tyres has a total paid-up capital of Rs 4.5 crores, 74 per cent of which was held by the US company. According to the final approval, the Government has allowed the payment of Rs 9 for the Rs 10 equity share. The book value of an equity share of Bombay Tyres at the end of 1978-79 was Rs 39 and the market price on July 17, 1981 was only Rs 13. The value fixed at Rs 9 per share for the purpose of payment to the US company seems to have been fixed after considering the need for modernising the Bombay Tyres' plant which with an installed capacity of 11 lakh automobile tyres and tubes each could produce only 7.85 lakh tyres and 6.89 lakh tubes during 1978-79. It may be recalled that the employees of Bombay Tyres and the Bombay Taximen's Union had been making a bid to purchase the US company's shareholdings in Bombay Tyres even by offering Rs 1 crore more than what Modi Rubber agreed to pay. However, after considering the ability of the contending parties in securing the latest technology needed to modernise the plant, in pumping in funds on a large scale for the purpose and in managing a large industrial undertaking, the Government has finally approved Modi Rubber's take-over of Bombay Tyres.

Modi Rubber is vying to become the largest tyre manufacturer in the country with the acquisition of Bombay Tyres. So far Dunlop India Ltd, having an installed capacity of 21.80 lakh automobile tyres and tubes and possessing an industrial licence to add 1.5 lakh truck tyres capacity has been at the top among the 13 units engaged in the manufacture of automobile tyres and tubes in the country with an overall installed capacity of 69.49 lakh numbers each per annum. Although Modi Rubber's licensed capacity is 4 lakh automobile tyres and tubes, it has applied to the Government for regularisation of its existing installed capacity of 9.5 lakh automobile tyres and tubes. In addition, the company has been issued a letter of intent to add a capacity for 2 lakh automobile tyres and tubes.

Tea in trouble

MOST tea gardens in Darjeeling and a majority of the gardens in the Dooars produced unsatisfactory results last year. South India too had a disastrous year. Only in Assam was the picture optimistic for gardens manufacturing quality teas or with above-average yields. This is the finding of the annual review of the tea industry for 1980 published by the Calcutta tea brokers, J. Thomas and Company.

However, exports over the past couple of years have seen excellent harvests worldwide. In countries where tea is state-owned, exports have been negotiated irrespective of production cost. In India consumption faces a setback partly owing to the result of high price of sugar and its poor availability. Tea movement also faced periodic difficulties because of disturbed warehouse conditions, high interest costs, high transportation charges and the disturbed situation in Assam. The fortunes for the current financial year appear to be mixed, the review says, because of likely contraction in north Indian production due to changes in agricultural practices. Domestic consumption may increase because of easier availability of sugar.

Soap prices to increase?

WITH the sharp hike in the effective customs duty on vegetable oils and allied products to 150 per cent *ad valorem*, soap prices are expected to increase. The soap industry imported mainly beef tallow, palm sterine, palm fatty acid and palm acid and corn oil, because of shortage of rice bran oil. During the last financial year the industry had reportedly imported 200,000 tonnes of these oils.

Meanwhile trade circles have come to the conclusion that it would be most uneconomic now to import vegetable oils. An estimated 30,000 tonnes of oils are on their way to this country and the trade is reportedly trying to wriggle out of remaining contracts totalling about 1,25,000 tonnes and worth over Rs 75 crores.

Rubber imports

THE Kerala Government's move to force the Centre to ban rubber imports has expectedly caused a flutter in the rubber-based industries which have termed the step as reckless and irresponsible. Not only the restrictions on rubber imports should be removed but that more quantities should be permitted for immediate import to meet the industries' requirements for the rest of the current fiscal year, it is stated. The natural rubber production in India has not increased adequately to take care of demand in the last five years and at the same time minimum stock levels to meet three months' consumption have been at dangerously low levels. These factors have only seen skyrocketing prices in the rubber market and this is exactly why, the industry circles point out, imports of rubber have been allowed by the Government. Since the indigenous prices continue to rule much higher than the statutory prices, any marginal fall in the prices arising from imports of rubber is immediately used as a lever by the rubber planters to put pressure on the Government to ban imports. The industry circles say that the Government should not yield to such pressure tactics that give one-sided advantage against the interests of the whole nation.

COMMODITIES

Cotton steady

Bombay, July 20

Steady conditions were witnessed in the spot cotton market during the past week. Spinner interest was mainly confined to medium and short staple varieties. Export inquiries were also reported for some of the finer cotton lots in view of the prospects of a selective export quota for longer staple growths.

There have been vague reports that the Government of India might allow the import of Pakistan cotton. These reports gained some credence on the return of the CCI delegation from its trip to East Asia. Subsequently, however, there have been denials, quoting official sources from New Delhi, about the import prospects, pointing out further the Government had yet to consider the question in earnest.

Reports about the progress of the monsoon in the cotton growing tracts have so far been generally favourable for plant growth. Even so, cotton circles in Bombay are inclined to wait for some more time before making any assessment of the crop prospects. Some of the flood reports reaching Bombay from several upcountry centres, have been rather disquieting.

The decision of the Government of India to allow all textile mills to import partially oriented yarn (POY) under OGL has been welcomed by the industry as well as the small crimpers who had been worried about their idle capacity. It has been clarified by the Textile Commissioner that even textile mills that do not have their own draw-texturising units could avail of the import facility.

The National Textile Corporation has announced its decision to set up two exclusively export-oriented mills, one in Gujarat and the other in Tamil Nadu.

The following has been the trend of prices of some of the leading varieties :

(Rs. per candy)

	July 17	July 10
Digvijay	5,100-5,150	5,050-5,150
Kalyan	4,800-4,900	4,750-4,850

MP A 51/9	5,100-5,200	5,100-5,200
MCU 5 Guntur	5,900-6,100	5,900-6,100

Downward trend in yarn

Bombay, July 20

A downward trend prevailed in the local yarn market last week. The prices of 150D NRC, 120D NRC, 150D CR and 120D CR declined by Rs 1.10, Rs 0.28, Rs 1.10 and Rs 0.29 to Rs 50.11, Rs 52.03, Rs 49.56 and Rs 52.31 respectively. The prices of 100D SIV and 150D Acetate however, remained unchanged at Rs 55.07 and Rs 41.85 respectively.

Jute goods recede

Calcutta, July 20

Jute goods prices in the Calcutta gunny market last week initially rallied all round in the wake of the proposal to raise the floor price of sacking at the East India Exchange. Subsequently, however, prices receded following opposition to the move from the trade which kept the market closed for three days as a protest. Activity was confined to specula-

NOTICE

It is hereby notified for the information of the public that Voltas Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval for the establishment of a new undertaking (Refrigerator Division) for the production, supply and distribution of Domestic Refrigerators. (Proposed installed capacity : 100,000 Nos. Refrigerators. Estimated annual production : 100,000 Nos. Refrigerators). Other particulars of the proposed new undertaking are as under :

(i) Name of the proposed undertaking : VOLTAS LTD. (Refrigerator Division)

(ii) Name of authority proposing to establish the new undertaking. Where it is a body corporate, furnish details of its management structure together with those of the proposed undertaking. : Voltas Limited

Board of Directors.

Mr. A. Hydari (Chairman)
Mr. A. H. Tobaccowala (Vice-Chairman and Managing Director)
Mr. J. D. Choksi
Mr. B. Reinhart
Mr. A. B. Bilimoria
Mr. R. J. Matthai
Mr. S. P. Mehta (Alternate Director for Mr. B. Reinhart)
Mr. M. L. Apte
Mr. N. J. Jeejeebhoy (Executive Director)
Mr. B. C. Randeria

(iii) Capital structure of the applicant authority and of the proposed undertaking (as on 31st July, 1981) :

Authorised :

9,98,000 Equity Shares of Rs. 100/- each	9,98,00,000
20,000 Equity Shares of 'B' Series of Rs. 10/- each ..	2,00,000
	10,00,00,000

Issued, Subscribed and Paid-up :

6,27,796 Equity Shares of Rs. 100/- each fully paid	6,27,79,600
14,117 Equity Shares of 'B' Series of Rs. 10/- each fully paid	1,41,170
	6,29,20,770

(iv) Proposed location of the new undertaking : Backward area in Maharashtra, to be decided in consultation with the State Government.

(v) Brief outline of the cost of project, the scheme and source of finance :

Estimated cost of the project

		(Rs in lakhs)
1.	Land and site development ..	8.00
2.	Buildings	240.00
3.	Plant and Machinery.. ..	260.00
4.	Furniture and Office equipment	15.00
5.	Contingency and escalation ..	26.00
6.	Margin money for working capital	43.00
		592.00

Means of finance

		(Rs in lakhs)
1.	Internal resources	124.00
2.	Capital subsidy from Central Government (Pioneer Unit in a Notified backward area)	40.00
3.	Secured long-term and medium term loan from SICOM and all-India Financial Institution ..	428.00
		592.00

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notices, intimating his views on the proposal and indicating the nature of his interest therein.

tive manoeuvres and actual business was negligible.

Export inquiries were few and far between while buying on account of DGS and D was limited. As a result, the volume of business remained small.

The fibre market was steady with W-5 grade jute held at Rs 281 per quintal for most part of the week. The fixation of a higher floor price for the current season aided sentiment of the market.

The Centre is studying the demand of the jute industry for granting cash subsidy on exports of jute goods, particularly carpetbacking cloth, as part of an integrated package of measures to bail out the industry firm its present glut.

A final decision on the issue is likely to be taken shortly, according to sources which said that cash compensatory support for CBC export is necessary since the manufacturing mills and merchant shippers are finding it difficult to sell the item in international markets because of the worldwide recession.

Even the reduced export registration prices of Rs. 6.300 a tonne for 7 ounce cloth and Rs 6.600 for the 6 ounce one has failed to attract buyers. The newly introduced lightweight 5.5 ounce cloth at Rs 6.300 a tonne has also not fared very well despite the fact that these floor prices are much lower than the average manufacturing cost of Rs 3.500 a tonne of CBC, industry sources said.

Meanwhile, there was serious disagreement between the jute mills on the one hand and the brokers, traders and the merchant shippers on the other at the board meeting of the East India Jute and Hessian Exchange Limited last week on the issue of minimum price for B-twills to ensure the mills of a higher price than that ruling at present. The trade by its greater strength on the board won the day defeating the mills.

Groundnut looks up

Bombay, July 21

Groundnut looked up in an otherwise quiet oilseeds market during the past week. This was because supplies from the g
rowing centres were fi
and firm advices. Karad b
Saurashtra bold and Sau
shtra quality improved by R
each to Rs 627, Rs 632
Rs 636 per 100 kg. Ground
oil scaled new peak at Rs
but declined to Rs 132.88
10 kg towards the end of
week. Restrictions on marg
in respect of millers, wh
salers and retailers by
Gujarat Government advers
affected the sentiment and
sulted in less supplies fr
Gujarat.

Most of the imported
dropped on slack demand
cause of the availability of c
tonseed refined oil. Palmol
was placed lower at Rs 14
against Rs 143.52 and soyab

I.T.C. LIMITED

The board of directors of I.T.C. Limited at a meeting held on 14th July 1981, decided to recommend to the shareholders at the 70th Annual General Meeting to be held on 27th August, 1981, the payment of a dividend for the year ended 31st March, 1981 of 16%-subject to tax, the turnover for the year ended 31st March, 1981 is Rs. 429 . 78. 03. 530 (1980- Rs.4. 55. 65. 46. 196.). The gross profit for the year ended 31st March 1981 is Rs. 13.75.73.277 (1980-Rs.13.61.09.274), the net profit for the year ended 31st March 1981 is Rs. 641.99.441 (1980-Rs. 5. 59. 71. 525) after deducting all charges and expenses and providing for taxation for the year amounting to Rs. 733.73.836 (1980-Rs. 8.01. 37.749). Development rebate written back amounts to Rs. 23.40.743 (1980-Rs. 10.30.815), and from the profits of the year the directors have recommended that Rs. 25.50.000 be deducted towards investment allowance reserve (1980-Rs.6.80.00) besides the other appropriations mentioned below :—

Capital reserve — Rs. 2.78.585 (1980-Rs.5.83.247)

General reserve—Rs. 19.050.799 (Rs.2..06.29.093)—(1980)

Debenture redemption reserve Rs. 10.00.000 (1980 Rs. 10.00.000)

The proposed dividend, if declared, will be payable on or after 18th September, 1981, to the shareholders whose names appear on the register of members of the company on 27th August, 1981. The register of members of the company will be closed from 18th August, 1981 to 27th August, 1981, both days inclusive. Share transfers received in order at the office of the company's registrars, CPA Consultancy Services (P) Ltd., 11 1A Sarojini Naidu Sarani (formerly Rawdon Street,) Calcutta 700 017, by 17th August, 1981, will be passed for payment of dividend to the transferees.

By Order of the Board

Linseed oil	125.50	121.00

Coarse grains steady

Bombay, July 20

A steady to better tendency featured trading in grains in the local market during the week under review.

In cereals, wheat hardened on limited supplies and good demand. The inflow of wheat was about 900 bags. The superior variety fetched Rs 300-340 per quintal, an increase of Rs 7 over the preceding week's level. The Saurashtra variety was traded Rs 3 higher at Rs 220-240 per quintal.

Activity in rice was restricted. Arrivals from the south amounted to seven wagon loads. Demand was moderate. Export demand for basmati was limited. The basmati variety was traded at Rs 450-600 per quintal and Surti kolam variety at Rs 340-400 per quintal showing no change over the week.

In coarse grains a steady trend was evident. Jowar ruled at Rs 185-225 per quintal and bajra at Rs 165-230 per quintal. Maize ruled at Rs 155-180 per quintal.

Among pulses tur dal gained by Rs 20 to Rs 500-600 per quintal. Gram declined marginally by a rupee at Rs 400-407 per quintal.

Sugar recedes

Bombay, July 20

Sugar prices displayed weakness due to heavy pressure of supplies amidst poor offtake. The price of sugar (C-30) declined sharply by Rs 31 to Rs 661-698 per quintal at the close of the week. The undertone was subdued as sellers anticipated a further fall in prices and stockists were keen on unloading. Sugar stocks with the city dealers were placed at 3,572 bags as against 2,230 bags in the preceding week. The price of sugar (C-30) on July 18, 1981 was lower by Rs 195 per quintal than on the corresponding date a year ago.

The State factories quoted both grades of sugar at Rs 565-575 per quintal as against the opening levels of Rs 625-640 per quintal and Rs 625-634 per quintal respectively.

Khandsari was quoted in the range of Rs 475-525 per quintal as compared to last week's level of Rs 500-580 per quintal.

Gold erratic, silver up

Bombay, July 20

An erratic tendency in gold and an uptrend in silver marked the trading in the Bombay bullion market during the past week.

Standard mint gold opened at Rs 1,685 per 10 gms and after declining to the week's low of Rs 1,660 per 10 gms firmed up to Rs 1,675 per 10 gms before finally closing at Rs 1,670 per 10 gms. Ready silver (.999 fineness) opened at Rs 2,325 per kg and after dropping to Rs 2,350 per kg on one day maintained the uptrend and was finally placed at Rs 2,460 per kg.

Money comfortable

Bombay, July 20

Conditions continued to be comfortable in the Bombay short-term money market during the past week. Both notified and commercial funds opened at eight per cent went on declining to three per cent on Friday (July 17). The rates, however, hardened subsequently to 8.5 per cent before finally closing at eight per cent.

Spurt in aggregate deposits

Bombay, July 20

Aggregate deposits of scheduled commercial banks spurted by Rs 233.29 crores to Rs 40,402.02 crores during the week ended July 10, 1981. Bank credit expanded by Rs 42.59 crores to Rs 26,598.37 crores. The balances of banks with the RBI went up by Rs 106.58 crores to Rs 4,504.37 crores and their borowings from the RBI increased by Rs 2.19 crores to Rs 572.23 crores.

MUKAND IRON & STEEL WORKS LTD.

NOTICE

It is hereby notified for the information of the public that MUKAND IRON & STEEL WORKS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of The Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for the production, supply, distribution or control of :

Item of manufacture	Capacity
SPONGE IRON	200,000 tonnes per annum.

Other particulars of the proposed new undertaking are as under :

Beyond headlines

Financial autonomy for states

By I. SATYA SUNDARAM

A GENUINE gravamen of the states is that they do not enjoy financial independence under the present Centre-state financial relations as they are made to depend more and more on the Centre. The various Finance Commissions have naturally recommended for larger transfer of financial resources from the Centre to the states in tune with the growing financial commitments of the latter. In fact, one of the objectives of devolution was to ensure greater flow of financial resources to those states which are relatively backward.

The states' responsibilities are growing but the funds available to them are neither adequate nor elastic. Hence, the growing indebtedness of the states to the Centre. The overdrafts from the Reserve Bank of India continue to be a bone of contention and the Centre's refusal to permit overdrafts is resented by the states. Moreover, foreign aid and deficit financing are both in the Centre's sphere. In addition to this, the Centre also enjoys exclusive rights in respect of foreign trade, foreign exchange, banks and insurance. Thus, the Centre is in a very advantageous position *vis-a-vis* the states. No wonder, the states' overdrafts which were only Rs 23 crores in 1963-64 rose to Rs 430 crores in 1976-77.

The various Finance Commissions have been trying to remove the financial imbalances between the Centre and the states and among the states themselves by not only enlarging the divisible pool but by evolving appropriate criteria to determine the due share of each state. For instance, the state's share in the net proceeds of income tax was only 50 per cent before the appointment of First Finance Commission, but the Seventh Finance Commission raised it to 85 per cent. However, in determining the share of each state, population factor was given undue importance (about 80 per cent weightage) by various Finance Commissions. This arrangement is not likely to help remove the economic backwardness of states since some states do enjoy a higher per capita income in spite of larger population than others. Therefore, the Seventh Finance Commission in respect of state's share in union excise duties raised the percentage from 20 to 40. Regarding the criteria for distributing among the states, it gave equal weightage of 25 per cent to each of the four factors, namely, the population of the state in 1971, the inverse of per capita state domestic product multiplied by the projected population of the state as on March 1, 1976, the percentage of the poor in the total population of each state and a formula of revenue equalisation worked out by the Commission.

The states' debt to the Centre which was Rs 445 crores in 1951-52 increased to Rs 5,519 crores in 1965-66 and was as high as Rs 13,591 crores in 1975-76. It was around Rs 18,786 crores at the end of March 1979. The Central loans accounted for 53.7 per cent of the total debt of the states in 1951-52. The proportion increased to 74.1 per cent in 1970-71 and slightly declined to 70.8 per cent in 1976-77. Total debt servicing charges including repayment of central loans was only Rs 21 crores in 1951-52. but increased to Rs 251 crores in 1960-61 and rose as high as to Rs 1,615 crores in 1976-77. These charges accounted for 9 per cent of the total tax revenue in 1950-51, which increased to 60 per cent in 1960-61 and to 78 per cent in 1976-77. Thus, three-fourths of the tax revenue has to be diverted to maintain the solvency of the states. In certain states the debt charges were more than their tax revenue which means that repayment of Central loans is made out of fresh loans.

No doubt, the terms of loans and the interest charges are liberal. Yet, states' indebtedness is growing. Writing off a portion of the debt or postponing repayment or rescheduling the debt will not solve the problem. If old loans are cancelled, the states are likely to become reckless in their demand for and use of loans. If they depend too much on money market, it may be dried up, starving the other sectors of the economy.

The states are by and large happy over the recommendations of the Seventh Finance Commission as it provided debt relief of varying degrees to the states amounting to about Rs 2,156 crores. They would also get additional Rs 2,000 crores a year on average for five years from the Central resources. The devolution to the states will be of the order of about Rs 21,000 crores during 1979-84 as against a little more than Rs 11,000 crores in the previous five years. In addition, statutory grants-in-aid of Rs 1,173 crores will also be given to eight states. Besides, the Commission has also recommended separate grants-in-aid of Rs 437 crores for upgrading the standards of administration.

Since the basic objective of transfer of resources from the Centre to the states is to reduce disparities in development among states, per capita income should be the sole criterion as it reflects economic backwardness. Towards better financial autonomy for states, it is suggested that the Centre's net proceeds of income tax be distributed among the states and the union territories, that the sharing of union excise duties with the states should be compulsory and that surcharge on income tax, corporation tax and customs duties should also be brought under the divisible pool as revenues from these sources have shown significant increase.

It is unfortunate that the states are unwilling to mobilise additional resources from the sources available to them. They must concentrate on taxes like betterment levy, better administration of present taxes like sales tax and quick recovery of tax arrears, economy in their expenditure, particularly unproductive expenditure and proper investment of loans obtained from the Centre. It is suggested that the Finance Commission has to evolve a certain mechanism by which states which mobilise additional resources are made eligible for larger share in the resources of the Centre.

While the states urge for larger share in the Centre's resources, they do not properly manage the projects under their control. For instance, gross receipts from irrigation are currently insufficient to clear even working expenses. The Sixth Plan 'Framework' observed that if irrigation rates are adjusted to cover only working expenses, the states can save nearly Rs 400 crores over the five year period. As it is, the losses on minor irrigation alone during the year 1978-79 were of the order of Rs 65 crores in 20 states. The commercial losses of states electricity boards increased from Rs 103 crores in 1973-74 to Rs 418 crores in 1979-80. The aggregate loss of state road transport corporations during 1979-80 was Rs 62.35 crores. The states obviously cannot hope to enjoy financial autonomy unless they fully exploit the sources of revenue available to them. Ensuring financial autonomy for states is the collective responsibility of the Centre and the states.

Mr Satya Sundaram is a lecturer in the Hindu College, Machilipatnam.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE FOR MONITORING CURRENT DEVELOPMENTS IN THE INDIAN ECONOMY

* The research work of the Bureau is organised through these nine Divisions :

(1) Agriculture,
(2) Industry,
(3) Corporate Sector,
(4) Regional Economics,
(5) Banking and Finance,
(6) International Economics,
(7) Unorganised Sector,
(8) Science and Technology, and
(9) Special Studies.

* Each Division is manned by experts who have specialised in their respective subjects.

* Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

* Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

* Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

All enquiries may be addressed to :

PEOPLE

Reporter

Mr B. N. Reporter has been re-elected president of the Indian Roads and Transport Development Association (IRTDA) for a further term of one year. Mr Reporter is the joint managing director of the Associated Cement Companies Ltd and he brings to his office varied experience in both the road and transport industries. IRTDA, one of the oldest and largest associations in the country, has made effective suggestions for improving the transport industry.

Khandekar

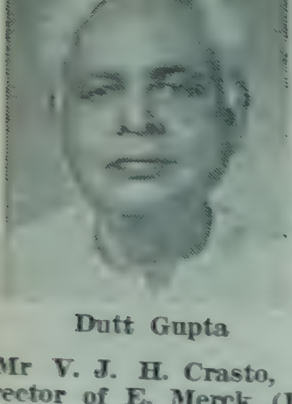
Mr S. M. Khandekar has been elected president of the Indian Pump Manufacturers Association. Mr Khandekar, who is vice-president (marketing) with Kirloskar Brothers Ltd, Pune, is also the chairman of the export committee and a member of the technical committee of the IPMA and an executive member of the Valves Manufacturers Association. Besides, he has been a member of several high power delegations to various countries.

Mr J. Sengupta has been appointed director of Chloride International Ltd of the UK.

Mr J. S. Bakshi has been appointed director (finance) of Indian Petrochemicals Corporation Ltd.

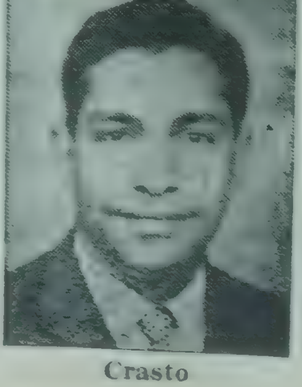
Ramanathan

Mr R. M. Ramanathan has been elected president of the Madras Stock Exchange for the year 1981-82. Mr S. Ramaswami was elected vice-president.



Dutt Gupta

Mr Hirendra Nath Dutt Gupta has been elected president of the Bengal National Chamber of Commerce and Industry for the current year. Mr Dutt Gupta is the managing director of East India Pharmaceutical Works Ltd and has been previously the president of the Organisation of Pharmaceutical Producers of India (OPPI). He is presently associated with a number of pharmaceutical and chemical organisations and institutes in India.



Crasto

Mr V. J. H. Crasto, managing director of E. Merck (India) Ltd has been invited to join the supervisory board of P. T. Merck Indonesia, Jakarta. Mr Crasto, who started his career in 1950, held several managerial positions before he became the founder-director of E. Merck (India) in 1967. He became managing director of the company in 1974. The invitation to join the supervisory board of the Indonesian company speaks of the recognition of Indian managerial talent by German principals of E. Merck.

THE WEEK

The ordinance on maintenance of essential ser vices, which bans strikes and would also cover lockout and lay-offs when presented to the Lok Sabha fo ratification in the next session of Parliament, has bee welcomed by labour ministers of most states excep Kerala and West Bengal. The Supreme Court ha dismissed two writ petitions challenging the ordinance

★

A study by the Federation of Indian Chambers of Commerce and Industry has indicated a shortfall of ten million tonnes in the targets of capacit increase in key basic industries like cement, fertilisers, steel and manmade fabrics during the Sixth Plan period.

★

Coal production in the country appears to be rising with July output of 9.23 million tonnes showing 12 per cent increase over the 8.24 million tonnes produced in the same month last year.

★

The Maharashtra Government has announced its intention to increase the minimum daily wages for bidi workers from the present Rs 4.75 per 1,000 bidis to Rs 7 to Rs 10 per thousand bidis depending on the bidi zones.

★

Power generation in the country is said to have improved by 17 per cent to 39,951 million units in the first four months (April-July) of 1981-82 compared with the figures in the same period of 1980-81 and crossed the target for the period by 500 million units. The rise is ascribed to improved thermal sector performance.

★

Minerals and Metals Trading Corporation of India has increased lead prices to Rs 13,000-13,100 per tonne, tin price to Rs 195,000 and nickel price to Rs 94,000 a tonne effective August 1 from Rs 11,000-11,100; Rs 180,000; and Rs 90,000 a tonne previously.

★

Wholesale price index

At 284.6, the latest available wholesale price index for the week ended July 11, 1981 showed a rise of 1.8 per cent over the preceding week and 10.7 per cent over the year.

Money comfortable

Conditions in the local short-term money market were comfortable as of Monday (July 27). Both notified and commercial funds were renewed at 6 per cent. Fresh money was transacted at 5 per cent and 4½ per cent. The market closed at 4½ per cent.

COMMERCE

Edible oil: Now a luxury!

EDIBLE oils are experiencing a run-away boom. Groundnut oil has risen in Bombay to over Rs 157 per 10 kg, an all-time peak, sesame to Rs 135-Rs 141 and cottonseed oil Rs 133-137; imported oils such as palmoleine, refined soyabean and RBD palm oil have also taken sharp jumps. In the retail market consumers have to pay a still higher price with groundnut oil costing Rs 17 per kg and refined Rs 22 per kg. Day-by-day this basic necessity is going beyond the reach of even the upper middle class, not to speak of the lower middle class and working classes despite heavy imports at annual cost of over Rs 700 crores. The onset of the monsoon and reports that production of oilseeds this year may be one million tonnes higher than the figure of 10.2 million tonnes in 1980-81 should have softened the prices somewhat but the market behaviour is contrary to expectations and an immediate reversal in the trend of prices is not in sight.

Marketmen trace this unprecedented advance in oil prices to several factors. It is said that farmers are holding back whatever stocks with them in the expectation of a further rise in prices and thereby have created a shortage in floating stock. Secondly, the policy pursued in Gujarat, the single largest groundnut producing area in the country, by the State Government of fixing margins for millers, wholesalers and retailers has almost paralysed the oil industry. Many doubt whether the State Government will be able to enforce such a policy, only creating in the process a shortage of groundnut oil. The recent hike in effective customs duty to 150 per ent on oils imported by the private trade has also ontributed to the rise. The Government increased the duty with the intention of mopping the huge profit that he trade made but the reports that the trade would ry to cancel the contracts for oils that are not on high eas or reached the ports have created a psychology of hortage thus helping the price rise. It may be noted hat the bulk of the canalised imports of oils through he STC go to the vanaspati industry. The picture about rivate trade oil imports is not clear but reports were hat ships with over 14,000 tonnes of oil ordered by he trade have already reached ports and another 16,000 onnes are on the high seas. To add to all the public istribution system is virtually inoperative as far as dible oils are concerned and reports persist that oils rom fair price shops find their way into the open market.

If the public distribution system has failed in egard to edible oils, we have not had also a green revolution in oilseeds such as was witnessed in wheat. There was a deterioration in the yields till the mid-1960s as compared to the 1930s and 1940s. Though in the subsequent 15 years there has been some recovery in yields, these, in the case of groundnut, sesame and linseed are below their average yields in 1930s and the yield of rapeseed and mustard is only about 20 per cent higher than in 1930s. As against a yield of 1,000 kg per hectare in 1930s the average yield in the case of groundnut, the most important oilseed, in 1976-79 was only 830 kg. If however the groundnut production has increased from 2.91 million tonnes in 1930s to 5.90 million tonnes during 1976-79 it was because the area under groundnut cultivation had seen a sharp step-up from 2.90 million hectares to 7.19 million hectares or 47 per cent of the area under major oilseeds. Edible oilseeds output has been stagnant, nay, fluctuated widely in the decade ending in 1978-79 between as low a figure of 6.5 million tonnes in 1972-73 to 9.1 million tonnes in 1978-79. The Sixth Plan document traces this to the fact that only eight per cent of the total area under oilseeds is irrigated and further a substantial part of rain-fed area under oilseeds is marginal land. Poor post-harvest technology including deficiency in marketing support and storage and processing arrangements also, the document says, have adverse effect on returns to growers and incentives for production.

The problems of a strategy for increasing oilseeds production have not been identified by the Planning Commission now. These factors were known before and even in 1977 an inter-ministerial group had suggested short-term and long-term measures to increase oilseeds production. Among the long-term measures recommended by the group were increase in irrigated areas in groundnut, specially in the command areas of Nagarjunasagar, Tungabhadra, Ghataprabha, Hirakud and areas under Rajasthan and Bhakra Nangal projects, and an intensive sesame development programme in the major sesame-growing areas. The group had also recommended short-term loans by the state government to farmers to enable them to increase fertiliser use, seed production and distribution programmes to be taken up by the National Seeds Corporation in co-operation with the State Seeds Corporation and State Farms Corporation of India and an encouragement for greater cultivation of soyabean and sunflower through developing adequate support for them.

The programme and the implementation of these recommendations has been uneven, if not tardy. It is stated that as a result of campaign launched in the irrigation command areas during 1979-80, summer groundnut area increased to about eight lakh hectares against 5.5 lakh hectares in 1977-78 and the Sixth Plan promises efforts to be made to raise irrigated summer groundnut area to 14 lakh hectares. It also talks of a production strategy for oilseeds like groundnut and mustard involving launching of an integrated oilseeds yield maximisation programme with emphasis on production and distribution of improved seeds, popularising application of fertilisers, specially phosphatic fertilisers to groundnut and soyabean crops, adoption of adequate and timely plant protection measures on an area basis, inclusion of oilseeds crop in irrigated crop rotations expansion of area under non-traditional crops like soyabean and sunflowers and demonstration of improved practices. And all this is expected to yield 11 million tonnes of five major oilseeds in the year 1984-85. It is not clear how with such a low target imports of edible oils can be avoided considering that even in the current year a production of 102 lakh tonnes is expected. A more intensified oilseeds development programme is called for that will increase the yield of groundnut and sesame and linseeds to at least the average of 1930s and raise further the yield of the rapeseed and mustard. Lack of ready markets has hindered the progress of production and non-traditional and new varieties of oilseeds. Soyabean and sunflower are known to give better yield and oil-content and their cultivation must be encouraged by popularising them and ensuring a fair price for them. Otherwise their anticipated production of 20 lakh tonnes will prove a paper scheme.

Pick-up in industrial production

AT a time when the country's foreign exchange reserves are dwindling by more than Rs 100 crores a month because of the widening foreign trade deficit, the news of recovery on the industrial front from the slidedown of 1979 and 1980 should provide cheers. According to the latest available data released by the Central Statistical Organisation, industrial production during the first four months (January-April) of 1981 increased by as much as 9.7 per cent over the corresponding period of 1980. This position seems to have further improved in that according to the estimates made by the *Commerce Research Bureau* during the first half (January-June) of 1981 the rise in industrial production was 11.3 per cent over that in the corresponding period of last year. Viewed in the context of the fact that industrial production had recorded a fall of about 3 per cent in the first half of 1980 and had increased by less than one per cent during the whole of 1980, the recent uptrend is a very encouraging development.

Analysis made by *Commerce Research Bureau* indicates a definite improvement in large number of industries (with a combined weight of nearly 42 per cent in the index of industrial production) during recent months. Only two industries, namely, cotton fabrics and tea (with a combined weight of about 8 per cent) recorded declines. Among the industries which recorded a rise during the first half of 1981 are: aluminium (37 per cent); automobiles (36 per cent); sugar (33 per cent); saleable steel (20 per cent); mining and quarrying (18 per cent) and cement (14 per cent). If these trends continued in the later half of 1981, industrial production was likely to achieve the targeted growth of 8-10 per cent during 1981. While this would certainly be above the long-term growth rate of about six per cent in industrial production, it should not give rise to any complacency as it comes, by and large, in the wake of below-normal growth of last two years.

The recovery on the industrial front was partly a result of improvement in the availability of infrastructure facilities. For example, power generation during the first seven months of 1981 increased by as much as 15 per cent. Following this improvement Tamil Nadu lifted all the power restrictions imposed earlier. Assam, Haryana and Punjab also lifted energy cuts but for restrictions on industries on peak period demand. It was reported that six infrastructure industries, namely electricity, coal, saleable steel, petroleum refinery products, crude petroleum and cement (accounting for a combined weight of 23 per cent in the index of industrial production) showed an overall rise of 23 per cent in production in June 1981 over June 1980. Improved infrastructure facilities had resulted in a sizeable coking coal stock of nearly 5 lakh tonnes with the steel plants in the middle of July as compared with 1.1 lakh tonnes at the end of July 1980 and only 65,000 tonnes in September 1980.

The cabinet sub-committee on infrastructure, headed by the Union Finance Minister, Mr R. Venkataraman, periodically meets to suggest ways of removing bottlenecks. The recent government decision to undertake a quarterly review of select public sector units is also expected to help in nursing back the ailing public sector undertakings to health. Of course, if we expect these units to maximise their capacity utilisation and deliver the goods, they should also be given some autonomy of operation. The Government has also assumed powers to ban strikes in essential services and industries and clarified that lay-offs and lockouts by the management would also be banned. While this in itself cannot ensure the rise in productivity of workers, the continued improvement in the availability of power and raw materials would help boost industrial production, if there is no other interruption in this productive process. Further, if industrial peace in to be ensured the workers need to be protected from the fury of ever-rising prices. This becomes all the more important now that the Government has banned strikes and rightly too.

Tea's travails

THE New Delhi meeting of the tea producers, the state governments concerned and the Central Government officials like the Tea Board chairman and the secretary to the Union Commerce Ministry would have achieved something if the Government of India could sympathetically listen to some of the longstanding grievances and take prompt remedial measures to help the industry ride out its current crisis. Not that the Government is unware of the pressing problems—most of them have arisen from the rather indifferent manner in which the industry's representations and pleadings have been treated—but in the context of a national conference which was called to discuss the problems specifically and in precise and concrete terms, New Delhi's approach should have inspired greater confidence in the industry than before.

Multiple rates of taxation, both on sales and income, have created a number of difficulties for the industry in terms of needless paper or clerical work in one case, and a complete erosion of financial resources in another. Taking the example of sales tax first; in Calcutta and Siliguri different rates apply; they range from 1 to 3 per cent. At Cochin, sales tax is levied 5 per cent *ad valorem* and a surcharge of the same order is imposed when turnover goes above a certain limit—and when the turnover exceeds Rs 10 lakhs, the surcharge rises to as much as 8 per cent. At Coonoor and Coimbatore, the rate is 5 per cent single point. Only in Gauhati there is no sales tax yet, perhaps the Government wants more tea to come to the auctions there, but the tea auctioned at Gauhati is still a small part of the country's total output and makes no difference to the industry's worries on account of the multiple rates sales tax enforced at the auctions. For the exporters and the packeteers different sales tax rates at different auctions could be a headache in controlling their costs and fixing their prices. According to one expert, the incidence of sales tax on an average tea price of Rs 14 a kilogram is 14 to 42 per cent at Calcutta and Siliguri, and as high as 70 to 73 per cent at Cochin, Coimbatore and Coonoor. It is high time a measure of rationalisation in this matter was attempted. The state governments do need revenue, but the country needs the tea industry for employment and exports.

The same can be said about the corporate levy and the agricultural income tax inposed by the Centre and the states respectively. The total incidence of these taxes works out to much a higher figure than the level of corporate taxation on industry as a whole. Some state governments, not content with the existing rates of levy now want to impose agricultural income tax on cent per cent of the tea industry's income. If the industry is to pay 40 per cent corporate tax as well, then it would amount to a taxation of 140 per cent of the income. It would than simply become taxation of capital.

One reason which may have prompted the states to enhance their agricultural income levies on the industry is the high level of prosperity which tea enjoyed from 1975 onwards, until early last year. The industry, of course, still has its own share of people who make the quick buck as traders, brokers or auctioneers, but the industry's economic condition generally is no longer that prosperous as it was only two years ago. Indeed the industry has been overtaken by a serious crisis, firstly due to an oversupply situation in the world markets. That situation has kept down the rates at the London auctions which are still the barometer of world tea prices, and have thereby been influencing auction prices in the producing countries steadily downwards. Even in India, where the internal market is already absorbing more than 60 per cent of the output, auction prices have been ruling fairly low because of the adverse international trend. They are so low that for the majority of the gardens, the auction realisation is said to be below their costs today and costs are likely to escalate further because of higher prices for the petroleum products, fertilisers, coal and other essential inputs they use. It is worth investigating of course how much of the so-called production cost is on account of the top heavy nature of most of the large tea companies or groups, and their various devious accounting procedures, but there is no denying the fact that a good deal of rising costs is on account of the ever increasing wage bill and welfare burdens that the industry has felt compelled to shoulder.

Since wage increases for labour cannot be postponed because of the inflationary conditions in the economy and the recent rise in food prices, the industry can be saved only by suitable and imaginative fiscal concessions. If the press reports that the Centre is considering a single levy in the place of the state agricultural income tax and the usual corporation tax are correct, then a step in the right direction is being considered. As for the sales tax imposed by the state governments, the same approach is called for. There is yet another problem—that of providing adequate bank funds for the industry's working capital needs. The old norms laid down by the Dutt Committee are already irrelevant, and the Chore Committee's recommendations should not be applied to the tea industry at this stage. Since the Government has already withdrawn the export duty it is not clear what further help or incentives can be now offered for bulk tea exports, but packet tea or tea exports in value added form should be given a greater measure of subsidy if and when circumstances so requires.

LETTER FROM LONDON

Industrial competitiveness improves

FRANK BROADWAY

LONDON

THE competitiveness of British industry is now showing distinct signs of improvement, with the drastic rationalisation undertaken by many companies beginning to work through into productivity. The Bank of England recently estimated that output per man-hour in Britain rose by 2.5 per cent between the first quarters of 1980 and 1981, while there was no change in productivity in competitor nations. With a moderate level of wage settlements in manufacturing industry, and the decline in the value of the pound against the US dollar in recent months, the Confederation of British Industry (CBI) calculates that unit labour costs in Britain have fallen by over six per cent relative to other major industrial nations since the first quarter of this year.

Both the Government and CBI are insisting that the downward trend in wage settlements must continue in the next pay round, which starts in the autumn. The trade unions are naturally resisting the idea, but there are reasonable hopes of securing a level of settlements around half the 10 to 11 per cent seen in manufacturing industry at the present time. If this happens, and the potential for productivity increases, which has resulted from massive redundancies and better working practices, is realised as output recovers, British industry could show a major increase in competitiveness during the next 12 months.

Moderation in wage settlements will be helped if, as expected, the annual rate of inflation in Britain continues to fall. In May it fell again—to 11.7 per cent. The fall in sterling against the dollar now implies higher costs for imported materials which will work their way through to retail prices in six to twelve months time. However, between May and June the price index for materials and fuel bought by manufacturing industry rose by just 1½ per cent and this surprised many economic pundits who had forecast an increase of 2 to 3½ per cent.

Prices held down

Nearly two thirds of the rise was a result of the higher sterling price for crude oil caused by the recent depreciation of sterling, but this increase was partly offset by a reduction in the price of North Sea oil—a factor that has been left out of the equation by many experts. The North Sea provides about half Britain's supplies of crude oil and the recent ten per cent price reduction is bound to ease manufacturers' costs.

Certainly as far as output, or "factory gate" prices are concerned manufacturers are being forced to hold down their prices and it is retailers who are calling the tune. They realise that if demand is to be kept buoyant when unemployment is high and wage rises are low, prices must be kept down—and manufacturers are forced by competitive pressures to fall in line.

While control of inflation remains the top priority concern about unemployment is a close second with particular attention being paid to young people. A total of £1,300 million is being spent this year on the Government's special measures to combat high unemployment and maintain training levels. Some £1,000 million is for the special employment measures —about a third of which helps unemployed youngsters in Training Courses and Work Experience Schemes under the Youth Opportunities Programme, and a further £300 million will pay for training over 100,000 adults and young people.

Ministers have increased the size of the Youth Opportunities Programme from 360,000 places last year to 450,000 places this year and are considering the Manpower Services Commission's request for a further 100,000 places. The intention is that no one should leave the Programme without acquiring some of the basic skills needed to compete in the jobs market. It is also hoped to have a network of opportunities provided for the training and re-training of adults at several points in their working lives.

All these moves are designed to ensure that as the country moves out of recession the recovery does not grind to a halt because of lack of skills. Fortunately the rate of increase in adult unemployment continues to slacken. On a seasonally adjusted basis, the increase in June was 37,800, the lowest monthly rise since March 1980. All the statistical evidence now suggests that the recession has "bottomed out" but economic recovery has yet to begin.

Sterling under pressure

There is a certain irony in the fact that sterling should be under pressure just when the economy is improving. Sterling's strength had persisted despite a higher than average inflation rate in Britain and repeated warnings by Economic Ministers that Britain faced serious problems which would take the better part of a decade to solve.

But to a significant extent the recent fall in the pound represents an overdue adjustment to more realistic levels. This is doubtless a major reason why the Government has made no attempt to defend the pound by raising interest rates or prompting large scale Bank of England intervention in foreign exchange markets.

In addition, there is no reason to expect the current exchange rates to last indefinitely. Logic suggests that European currencies, including the pound, may rise against the dollar when American interest rates eventually fall, but the pound could decline further against the European currencies to reflect changes in competitiveness during the last few years.

Whatever happens the productivity and other improvements now taking place in British industry will be crucial to overall economic success.

EDITOR'S NOTEBOOK

Vadilal Dagli

WHILE gold prices have dropped from $850 an ounce in January 1980 to around $392 an ounce in the first week of August, the drop in silver prices is more dramatic. Silver which was quoted at $50 an ounce in January last year has now retreated to as low a figure as $8.25 an ounce. Like gold, silver was also considered to be a good investment in an inflationary situation when the dollar was going down and prices in America and the West European countries were rising. Now the American inflation rate is brought under some control and the dollar has been riding high as it has not done during the past two decades. So speculators have found that it is better to invest in dollar securities rather than in silver and gold. Big speculators like the Hunt brothers had cornered silver in fantastic deals in which millions of dollars were involved. But now gold and silver are fast becoming the commoners among metals.

There is also depressing news for silver hoarders. Recently the American Congress approved the sale of 105 million ounces of silver between 1982 and 1984 from the stockpile of the United States Government. Of course, the American Senate has put a rider. It says that sales cannot be made from the government stockpile if such sales disrupt the market. The price of silver has been falling rapidly, but if American Government finds the selling of silver is a profitable proposition, they may jolly well not care for any market. According to the time table, nearly 46.5 million ounces of silver will be sold in 1982, 44.7 million ounces in 1983 and 13.9 million ounces in 1984. There is also a stipulation that the silver which is not sold in its designated year (for instance 46.5 million ounces in 1982) cannot be sold the next year. Unsold silver must be returned to the US Government stockpile. So from January 1982 American Government would be selling silver at the rate of one million ounces a week. Whether such a sale would disrupt the market or not is a question that has to be decided by the US Government only. Why did America decide to sell as much as 105 million ounces of silver? The Reagan Administration thought that the sale of silver would help it to raise money for mounting defence expenditure. The American Government has also decided to buy new stockpile materials valued at about $550 million along with the sale of silver. What commodities America will buy has been kept a secret. But the news that after a few months America would start selling silver has itself had a tremendous bearish impact on the world silver markets.

What would be the impact on India of the crash in silver prices? As silver prices have been falling steadily over the past 20 months the price difference between the London and Bombay markets has been increasingly diminishing. On June 26 the price of silver in Bommay market was Rs 2,415 per kg as against Rs 2,601 per kg in London (a difference of Rs 186). But about a month later, on July 27, silver price in Bombay was Rs 2,520 a kg while in London it slumped to Rs 2,432 a kg; in other words the London price for the first time was lower by Rs 88 per kg as compared to the Bombay price. When the price difference was advantageous to smugglers they were buying gold and smuggling it into the country for which they were paying in terms of silver. Now because of the steady fall of gold prices in the world markets there is an advantage of Rs 520 per 10 grams of gold to smugglers who want to bring gold into India. This is why smugglers will still take silver out of India and bring gold into the country.

★

POLAND is civilising communism which is based on the dictatorship of the communist party and the few chosen members of the Politbureau. Recently the Politbureau was elected by secret ballot in Poland which is a major breakthrough in the matter of internal democracy in the working of the communist parties of the world. Poland made history again when on July 21 that country's communist-controlled parliament passed a bill that relaxed censorship. Freedom of speech and publication and broadcast is completely wiped out in communist societies. Till recently, the poems of Poland's Nobel Prize winning poet Czeslaw were not allowed to be published in Poland. But the workers revolted not only for more bread but also for establishing a tolerably truthful press, radio and TV. Though the July 31 law does not permit freedom of the press, radio and TV, publishing, theatre and cinema as we normally understand, it states in great detail what may and may not be published or broadcast. It does retain prior censorship. But the law restricts the censor's powers and has set up a system of appeal. One member of parliament described the censorship of the past as "a harmful corner of our history". The new law, however, prohibits criticism of Poland's alliance with the Soviet Union. But that restriction is necessary to avoid the Soviet tanks marching into the streets of Warsaw.

★

THE only heroism one would like to salute is the heroism of a person who would continue to be consistently creative and socially useful in the face of certain death. Prof Aniruddh Brahmabhatt who died at the age of 43 on July 31 at Ahmedabad was such a heroic soul. Aniruddh was an outstanding critic and essayist who also wrote verse. About six years ago he was afflicted with the horrifying disease of blood cancer. While his friends were worried about the almost certain departure of a versatile writer, Aniruddh, who taught at the Gujarat university, worked as if he had been suffering from a mild ailment. His creative will was not paralysed by the spectre of death. He went on writing delightful biographical essays, literary criticism and reflective philosphical articles. He also wrote regularly two columns a week for the well-known Gujarati daily, *Mumbai Samachar*. A week before he died, he had posted the last piece of his column. He stopped writing only when he lost vision and the power of hearing a few days before he died. Aniruddh was perhaps the most serious practitioner of the art of literary criticism among the younger generation of Gujarati writers. The tradition that the great critic Ramanarayan Pathak had started in the field of criticism was carried further by Aniruddh. Aniruddh had translated Aristotle's work on poetics. This was followed by his own original work of criticism *Anviksha* (close assessment) which singled him out as a critic who synthesised Indian and Western aesthetic heritage. His biographical essays *Nam-rup* (names and forms) is a major contribution in this seemingly simple but difficult genre. The way Aniruddh grappled with death could be a theme of a major poem.

COVER STORY

Opportunities for joint ventures in Africa

By **PRIYA V. MUTALIK-DESAI**

TODAY the developing countries are restless to usher in the New International Economic Order (NIEO) with a view to restructuring the world economy and evolving a new framework which can ameliorate the ills of the present structure and strengthen their bargaining position. Though there is growing awareness that this co-operative endeavour would require global effort, greater significance than ever before is attached to the concept and imperatives of Economic Co-operation among Developing Countries (ECDC) and Technical Co-operation among Developing Countries (TCDC). Simultaneously, a general impression is gaining ground that India is well-poised in terms of industrial advance, supported by the development of indigenous and autonomous technological capability, to effectively assist in this process within the framework of collective self-reliance.

The scientific and technological progress achieved by India while accelerating the pace of building industrial India of today has also aroused the expectations of the rest of the developing world regarding India's participation in their industrial development programmes. A view is gaining currency that India's industrial experience should not only provide guidelines for other developing countries' industrialisation programmes but that she should share also her expertise and management in similar ventures in these countries. In fact, an increasing flow of visiting dignitaries, diplomats, industrialists and business delegations, government officials as well as student and trainee technicians are carrying back optimistic messages of the achievements of India and suggesting instrumentalities to strengthen the bonds of co-operative action for mutual benefits.

A large number of economic, technical and scientific co-operation agreements with the countries of Africa, Asia and Latin America is a sequel and manifestation of this new consciousness regarding the concept of international co-responsibility and interdependence. It is in this light that it would be instructive to discuss the role and experiences of Indian industrialists in some of the African countries. It is important to note that recently there has again been a revival in the interest in setting up ventures in some of the African countries.

Abundant natural resources

It is well known that the continent of Africa has considerable natural resources. It possesses about one-third of the known and explorable hydroelectric potential and about 10 per cent of known petroleum reserves in addition to having good prospects of solar, thermal, tidal and geo-thermic energy. Additionally, the region is endowed with good mineral resources, such as gold, uranium, copper, diamonds, phosphate, coal, lead ore, zinc and accounts for about one-third of the total value of world mineral output. The present scramble for Africa is closely related to the exploitation of these potential resources as well as the capturing of the markets to unload the manufactured goods. All this also makes Africa the continent of future. India which has enjoyed close commercial and cultural ties with some African countries has never been a party to this scramble specially because of its own colonial experience, lack of super-power ambitions, its own problems of development and also due to its support to the liberation movements in Africa, its prominent role in the non-alignment movement and the peaceful character of its political relations with the rest of the world.

In keeping with this strategy, India's endeavour has been to play a constructive role in African countries through export promotion, joint business ventures and technical assistance programmes. India's contacts with African countries date to early times and Indian industrialists is not a new phenomenon to a majority of African countries. At the beginning of the century, Indians role in that part of the world was fully recognised and appreciated. Sir Harry Johnson had observed, 'to the British Indians I can only wish unlimited success since they increase trade first in a small way and then in a large way where no trade has hitherto existed'. Winston Churchill paid high compliments to Indians when in 1908 he said, 'it is the Indian trader who penetrating and maintaining himself in all sorts of places to which no white man would go or in which no white man could earn a living has more than anyone else developed the beginnings of early trade and opened up the first slender means of communication'.

This commendable role played by Indian was overshadowed in the post-independence period in African countries. The exigencies of the situation demanded rapid indigenisation of trade, commerce and other industrial activity and had dampening influence on the activities of Indian industrialists. But as the African countries solved their immediate problems, some of the economic realities concerning industrialisation, and the supporting resources such as capital, skills etc came to the force. The resulting vacuum greatly encouraged Indian industrialists to set up a few ventures in some countries. One therefore finds that the expansion in trade with these countries and the business ventures set up have gone hand in hand and a commensurate increase in skill transfers through official and non-official channels has also taken place.

Trade with Africa

In overall terms India's trade with African countries has never been very large. Thus the two-way trade between India and African countries accounts for around Rs 400 crores with exports and imports of equal value. The country concentration is a noticeable feature of this trade. Overall picture that emerges demonstrates the overwhelming importance in imports from Africa of a few African countries such as Zaire, Ghana, Ivory Coast, Kenya, Morocco, Sudan, Egypt, Tanzania and Zambia, while Kenya, Tanzania, Egypt, Sudan, Zambia, Dahomey Republic, Nigeria, Ethiopia, Somalia are important in exports to Africa. Even the recent revival in India's exports to these countries is not commensurate to the total expansion in trade and could be seen in the decline of percentage share of Africa in India's total trade. This could be interpreted as providing a definite indication of scope for promotional efforts for two-

---

Dr (Mrs) Mutalik-Desai is Reader, Centre of East African Studies, University of Bombay.

way trade with many African countries where hypothetically Indian goods can find widening markets.

Now as the restructuring of this trade in line with diversified industrial production has taken place, engineering goods exports to Africa account for nearly 40 per cent of their total exports. African markets are still net importers of a large number of manufactured and semi-manufactured products. In Eastern and Southern Africa itself, the intra-area exports of industrial products, according to one estimate, could increase from US $300 million in 1975 to about US $400 million in 1985 and this is exclusive of important agro industrial products. India is an upcoming exporter of a majority of industrial products they need and if proper institutional and policy orientation are followed, a considerable gain could be secured in marketing the engineering goods in these countries.

The last few years have witnessed an increased export of Indian capital and technology too. Indian investment by way of equity share capital in the established joint ventures amounted to Rs 30.54 crores by January 1980 and another Rs 48.91 crores in the projects under implementation. While the South East Asian countries account for a lion's share in these investments, African investments rank second. One of the studies carried out by the Ministry of Commerce has commented favourably upon the encouraging performance of joint industrial ventures as extenders of development co-operation to the developing countries and as creators of opportunities for exports of India's capital goods, technology and know-how. Some of the important joint ventures fructified during 1970s and their growth also made clear the vital nexus between the joint ventures and the exports of non-traditional goods. It is felt that this process is likely to gather momentum with the widening of the scope of joint ventures as enunciated in the new guidelines laid down by the Government of India.

Indian Joint Ventures in Africa
(As on April 24, 1981)

Name of Indian party	Country of location	Field of collaboration	Indian equity (Rs lakhs)
Bolton India	Kenya	Auto ancillaries	5.52
Gangappa Cables Ltd.	Kenya	Copper and aluminium wire	3.00
J. K. Synthetics Ltd.	Kenya	Synthetic filament yarn	216.84
Kalindi Investments (P) Ltd.	Kenya	Pharmaceuticals	3.45
Kirloskar Brothers Ltd.	Kenya	Marketing	8.89
LIC and GIC of India	Kenya	Life and general insurance	58.30
Orient Paper Mills Ltd.	Kenya	Paper	412.88
Shri R. M. Goculdas	Kenya	Textile Mill	44.15
Salvi Pvt. Ltd.	Kenya	Cast iron foundry	0.42
The Raymond Woollen Mills Ltd.	Kenya	Woollen textiles	189.00
Exportos India	Mauritius	Readymade garments	9.33
Infin Consultants P. Ltd.	Mauritius	Steel rolling mill	6.48
Kirloskar Bros. Ltd.	Mauritius	Power driven pumps	1.12
Shahibag Entrepreneurs P. Ltd.	Mauritius	Cotton yarn terry towels etc.	69.86
Siddharth Jasubhai Lalbhai	Mauritius	Mosaic tiles and rolling shutters	0.60
Shri Kant Ruparel	Mauritius	Processing of textiles	1.73
The Raymond Woollen Mills Ltd.	Mauritius	Readymade garments (woollen)	13.19
Best Crompton Engineering Ltd.	Nigeria	Contracts for transmission lines	6.00
Birla Bros P. Ltd.	Nigeria	Consultancy	0.78
Birla Bros P. Ltd.	Nigeria	Light engineering goods	90.10
Ranbaxy Laboratories Ltd.	Nigeria	Drugs and pharmaceuticals	8.40
The Scindia Steam Navigation Ltd.	Nigeria	Shipping company	21.60
Birla Jute Mfg. Col Ltd.	Uganda	Jute goods	28.07

Total number of Indian joint ventures in Africa	23
Total value of Indian equity (Rs lakhs)	1,199.71

SOURCE: Lok Sabha Unstarred Question No. 8714, dated April 24, 1981.

Technology transfer

African countries have been an attractive area for Indian industrialists venturing out of the protected but at the same time competitive domestic market. Kenya has ten ventures under production and three ventures under implementation. Mauritius comes next with eight ventures under production and one venture under implementation. Nigeria has six and seven ventures under production and implementation respectively. Uganda, Ethiopia, Ghana and Libya are some of the other African countries where Indian investments are involved. The process know-how in the form of consultancy services has thrived well in Tanzania, Zambia, Libya, Egypt, Nigeria and Sudan. These efforts are interpreted to mean successful technology transfer which has become a key work for Indian co-operation with African countries. However, it will be premature to conclude that Indian industrialists have accomplished a tremendous task in African countries since evidence in this respect lacks uniformity.

Kenya

Let us look at the performance of Indian industrialists in Kenya where India has consistently cultivated the export market and has also launched a number of ventures in a variety of fields such as textiles, paper products, chemicals and chemical products and metal and allied products totalling to an equity investment of Rs 9.5 crores. Major industrial houses such as Birlas, Khataus, Singhanias and Sarabhais are active partners and managers in these ventures, while some public undertakings such as Hindustan Machine Tools have also taken initiative in starting machine tool production on a small scale in Kenya. Birla's Pan African Paper Mill and Khatau's Kisumu cotton mills are two of the finest ventures and have earned a place of pride in Kenya's industrial structure. All these ventures over the years have come out of woods and have achieved stability and progress and have substantially contributed to the production and export of consumer goods in Kenya. The performance of these ventures regarding contribution to foreign exchange earning and exports varies but all of them have helped Kenya substantially by the introduction and transfer of specific Indian skills of technical and middle level management. Recently a non-industrial joint venture too came up in the field of insurance wherein LIC of India and General Insurance Company have with Kenyan participation floated a new company named Kenindia Insurance Company.

In every venture without exception the top level management which includes executive director, financial controller, chief engineers etc are Indians and there does not seem to be any eagerness to Kenyanise any of these posts. The success of the ventures could be mainly attributed to the satisfactory general operating condition such as reasonably high productivity of labour, absence of labour trouble, favourable labour laws, fairly uncomplicated rules and regulations about investment, easy tax procedures and easy availability of imports.

In the light of the experience gained so far regarding the business environment in Kenya, it is not difficult for a few more industrialists to set up ventures such as mini-sugar plants, factories for three-wheeler rickshaws, plywood production, construction contracts, brick making factories, simple agricultural tool plants, pumping set production as well as auto-parts and ancillaries production. Despite strong British influence and increasing hold of multinationals on Kenya's economy, overall environment is conducive for a larger effort in this direction and the recently signed agreement between the National Chamber of Commerce and Industry, Kenya and Associated Chamber of Commerce and Industry, India, and the trade agreement between the Government of Kenya and the Government of India could herald a period of growing commercial effort in co-operative endeavours.

Tanzania

With Tanzania, India has forged very close ties since the political leadership is extremely favourable to the Indian participation in a variety of schemes. In fact, at present the low level of development and low per capita income do not ensure a very large market in Tanzania and the socialist pattern of development also means state participation and choice of products by state agencies. Due to these restrictive factors, joint business ventures are still few but consultancy and technology collaboration contracts have increased in importance and number and include some very prestigious projects such as Songo Songo gas exploration projects, manufacture of bicycles, Kagera sugar project expansion, railway consultancy contract, farm implement factory, know-how supply contract, Dodoma Capital Development project contract etc.

NIDC's co-operation with NDC of Tanzania in technical and consultancy matters has resulted in setting up Documentation Centre for NDC and carrying out feasibility studies for a number of industries. These efforts have resulted in the tremendous goodwill for Indian experts in Tanzania and have laid a sound foundation for other Indian businessmen to set up industries. Over and above this, the small scale industry development in Tanzania has received financial and physical assistance from India. India accepted a turnkey project in Tanzania to set up 48 small scale units, and a credit of Rs 2.5 crores was provided by the IDBI for the purchase of machinery. While the progress achieved is stated to be halting, local problems are being resolved to ensure speedy implementation.

In the Third Five Year Plan of Tanzanian Mainland, India's varied participation is expected and certain tie-ups on the basis of production co-operation are also visualised in areas such as cashew nuts, oilseeds, engineering items, diamond processing and mica production. In the manufacturing sector good scope exists in terms of our own capabilities for sewing machines, fans, domestic electric appliances and farm machinery industry etc. As it is India's products have penetrated in an effective manner in Tanzania.

India has developed close co-operation with Zambia as well and more than 2,500 Indian experts are at present working in Zambia. The trade agreement signed last year is expected to result in strengthening further the commercial side of our relations. In fact, repeated requests have been received from Zambia seeking India's assistance for a number of industrial projects such as steel re-rolling mill, paper and pulp project, small scale industries and industrial estates. The manufacture of hardware, agricultural implements, abrasive and sanitaryware, pumps, transformers, conduit pipes, hoes and shoes are some of the priority areas where investments are needed. The recent offer of Rs 100 million credit to Zambia will also result in new ventures. Zambia's copper wealth and fertile agricultural land makes Zambia a potentially rich country. While President Kaunda's visit in September 1980 and President Sanjeeva Reddy's visit in June 1981 have opened up new possibilities of co-operation, the birth of Zimbabwe has slowly allowed Zambia to attain normalcy which should make Zambia an attractive area for investment in a large number of labour intensive industries which receive a preferential treatment in Zambia. The first indication of this is the prospect of India bagging a rail contract for $18 million.

Nigeria

In Nigeria and Libya also, Indian entrepreneurs and technical experts have won laurels. Nigeria with its 80 million population and oil-bonanza is a proven area for prospective investments. The Third Development Plan, for 1975-1980 laid more emphasis on development of agriculture, increased food production, industrialisation, education and health. The contribution of manufacturing sector to gross domestic production though small, has maintained a consistently high growth rate over the past decade and accounts for 18 per cent of the GDP in recent years. Under the Third Plan, the Government aimed to encourage agriculture based industries and to establish chemical and petro-chemical industry, iron and steel complexes as well as development of automobile industry. Thus emphasis was gradually shifting from import substitution to the establishment of basic and intermediate industries. This itself opens untapped vast opportunities for entrepreneurs.

The Nigerian Investment Information and Promotion Centre is well equipped to provide requisite information to investors on matters relating to setting up of new industries and the Nigerian Enterprises Promotion Decree 1972 (published July 1977) provides the general operating framework. So far Indian entrepreneurs have set up plants for the manufacture of steel furniture, fans, fabricated steel materials and razor blades and provided management to a paper mill. Hindustan Machine Tools is also going into the machine tool plant in Nigeria while the Metallurgical and Engineering Consultants (India) Ltd have already bagged a prestigious contract of evaluation and project supervision of a steel plant with an investment of US $1 billion. A contract for $50 million is under negotiation to run the Nigerian railway for two years as the first $25 million contract expired in June 1980. This is to indicate the breakthrough that India has achieved in a fast expanding market in West Africa. If plants based on local resources of Nigeria are envisaged, Indian industrialists can enjoy bright performance in Nigeria where a beginning has already been made. The Indo-Nigerian joint commission held its first meeting in New Delhi recently and India has expressed her willingness to co-operate further in the Nigerian process of industrialisation.

Libya

In Libya, another oil rich country in Africa, Indian industrialists have developed close liasion. The Government of Libya had entrusted the work of preparation of the 1976-80 Development Plan to NIDC of India which was already acting as consultants on a turnkey basis for a steel melting and billet –casting plant at Tripoli. India's participation in development projects in Libya is expected to increase from Rs 600 crores to Rs 1,200 crores as a result of the protocol signed on the conclusion of Indo-Libyan Joint Commission at the end of 1978. Bharat Heavy Electricals Ltd (BHEL), Hindustan Steel Construction Ltd, and National Building and Construction Corporation are involved in huge projects in Libya. These important contracts have also heir counterpart in increased exports of variety of items.

Some failures

The success achieved in setting up ndustries, transferring skills and technoogy to some of the African countries is lso accompanied by some failures in ther countries such as Mauritius and Ethiopia. Particularly, Indian indusrialists have found it tough to function moothly in Mauritius as far as the joint entures established so far, which numer eight under production and one under implementation, are concerned. Mauritius which has more than 50 per cent of its population of Indian origin has age-old contacts with India and a pro-Indian government. Being a geopolitically strategically situated island, entrepreneurs from various countries are active on the Mauritian soil. The export processing zone established during the last decade attracted many outside investors to the country.

Most of the Indian ventures started production during 1971 to 1975. The products produced by these enterprises cover textiles, readymade garments, steel rolling mills, mosaic tiles and rolling shutters etc. Most of them have found it a tough going and the huge recurring losses suffered by these ventures have been a source of uncertainty to new entrepreneurs. One finds a rare example of Iron and Steel Ltd which was out of red by 1979.. Hydro Dyne Ltd, a venture of Kirloskar Bros Ltd for power driven pumps which went into production on a very small scale in 1978 is reported to have achieved steady growth. Though some allowance will have to be made for the impact of extra-critical condition of the Mauritian economy since 1975 as the sugar boom started petering out, it became clear to the author that Indian industrialists in Mauritius were poorly acquainted with the Mauritius socio-economic environment, characteristics of labour force, its value system and attitudes. Over and above this, a short term perspective and an obsession for quick gains seemed to have marred the initiative of these entrepreneurs making them throw up their hands at the slightest sign of difficulty.

It is perhaps here that Indian industrialists venturing in any of the African countries need to be cautioned. It was not at all unusual for industries set up at the peak of the boom to suffer badly during the immediate downswing compounded by other difficulties such as raging inflation, unwilling and low productivity labour forces, port congestion etc. Though no industrialist would like to continue with a chronically sick unit and would prefer the closure of the industry, with a manageable loss, it would be in the long term interest of Indian industrialists not to escape the misfortune by quitting the scene. In this process not only will they miss a prospective upswing but would do untold harm to the growth of future Indian enterprise in Mauritius as well as to the trend of healthy development of Indo-Mauritian relations which have by now developed a sound base. Indian industrialists' plight in Mauritius has certainly a few lessons to offer to ventures in Mauritius in particular and African countries in general.

Indian joint ventures under implementation in Africa
(As on 31.8.1980)

	Country		Number of joint ventures	Indian equity (Rs lakhs)
1.	Nigeria	..	8	1,209.74
2.	Liberia	..	1	68.00

	Total		18	1,453.89

SOURCE: Indian Investment Centre, **Indian Joint Ventures Abroad**, May 1981.

The tradition of government to government co-operation in economic and technical matters has been established over a period of twelve years and Indo-Mauritian joint commission on economic, technical and cultural co-operation concluded in 1979 laid down the guidelines for strengthening co-operation in varied fields such as trade, small scale industries, agriculture and rural development, public transport, medical facilities, meteorology and tourism. The Project and Equipment Corporation of India will assist the Mauritian authorities in securing supplies of machinery and equipment from India. India has offered to provide consultancy services to Mauritius for setting up a national shipping corporation and a national transport corporation. Deputation of Indian experts in Mauritius and the provision of training facilities for Mauritian nationals in India are the added aspects of technical co-operation programme between the two countries. This has also been matched by Rs 10 crore assistance and Rs 5 crore credit to Bank of Mauritius. In view of the multifarious co-operation, it is essential that Indian joint ventures in Mauritius by their performance add lustre to the co-operative endeavour.

A majority of African countries have their industries concentrated in and around cities due to the development of infrastructural facilities. Just as a success story of the Pan-African

Tax paying honesty and reduction

By **ARVIND BHANDARI**

DATELINE NEW DELHI

THE Finance Minister seems to be willing to reduce the tax on corporate and non-corporate incomes. At least this is what he told the Central Direct Taxes Advisory Committee on July 27. But the Finance Minister is insisting on putting the cart before the horse. Mr Venkataraman told the committee: "The question of reduction in the tax rates is inextricably linked with the degree of voluntary compliance on the part of taxpayers". In other words, he is making tax-paying honesty a pre-condition for tax reduction. Surely, he cannot be so ignorant as to not know that tax-paying honesty is itself a casualty of high taxation. Therefore, tax-paying honesty is incumbent on tax reduction and not vice versa. The Finance Minister also made the observation that the question of tax reduction was "subject to the overall budgetary compulsions". This is fair enough. But the question arises how much weight corporation tax and income tax carry in the Government's revenue. It is worth reflecting that in the budget estimates for the current year the receipts from corporation tax and income tax are put down as Rs 1,690 crores and Rs 1,599 crores, respectively, against a total tax and non-tax revenue of Rs 18,262 crores. From this it should be abundantly clear that lowering of income taxation on the corporate and non-corporate sectors would make a miniscule difference to government revenue. In fact, if the view that taxation has already reached the stage of diminishing returns is correct, it is quite possible that tax reduction may not result in diminution of revenues. Furthermore, a factor which has been a constant source of economic disincentive, corruption and general deterioration in national character will become less pernicious in its operation, if not altogether eliminated. While businessmen are no angels, FICCI's repetitive plea for reduction of the corporation tax to 50 per cent is sustainable on economic grounds. To go further, the opinion is fairly widespread that all bonafide savings should be exempted from income tax so that it would, in effect, become an expenditure tax, which is fundamentally a superior concept. The Finance Minister's assurance that the Government is seized of the problem of tax reforms carries little conviction. Much time has elapsed since the reports of the Wanchoo Committee and the Choksi Committee on direct taxes have been gathering dust on governmental shelves. In order to avoid action the reports were entrusted to an official committee in the Finance Ministry for examination. Since the official committee has served its purpose of enabling the Government to shilly-shally, the two reports have now been thrown into the lap of the Economic Administration Reforms Commission, which is becoming a vehicle for governmental procrastination. Such dawdling speaks of evasiveness, not action.

Gold ahoy

Reports from Dubai allege that more than 5000 tolas of gold is being smuggled into India every day. There is a minimum gap of 20 tonnes in the supply and demand of gold in this country. When the international price of gold dips sharply, Dubai traders, acting through Pakistani and Indian agents, step up their activity. Dubai is believed to have imported 3,000 kg of gold in May, most of which was sent to India. Recently, the smugglers switched their base to Delhi on finding that Bombay was no longer "safe" following the frequent cases of tip-off, seizure and arrest. In a business turnover of Rs 260 crores, the smugglers' net profit is estimated at Rs 60 crores. Gold also continues to be a favourite item for operators on the land border. The administration is said to have records of persons in north India who have become millionaries within a short time through smuggling across the India–Pakistan border. While India is a bottomless pit for gold, the country appears to have large quantities of silver to spare for the clandestine market. Of the 1600 tonnes of the white metal that becomes available in the country every year the domestic consumption is less than 50 per cent. The balance finds its way to foreign markets, mostly through smugglers exchanging gold for silver. Silver is much in demand in the West for industry. There is a profit margin of Rs 450 to Rs 500 per k of silver because of the notable difference in domestic and internationa prices. In January alone more tha 90,000 kg of silver was smuggled out o this country. The spurt in the smuggling of gold and silver reflects much discredit on the preventive staff of th Customs Department. The technique adopted by smugglers and their collaborators in India are well-known, an the usual hideouts are on India's extensive West coast, especially Bomba and Kutch. And yet the customs ar outwitted month after month, the seizures in Bombay and Delhi being a fraction of the smugglers total turnover. I is almost certain that some of the preventive staff look the other way, for consideration, while boats bringin Dubai gold land at predetermine places on the Indian coast.

No petro-dollars

When the Government relaxed it foreign investment policy a few month ago and announced that petro-dollar from the oil-exporting developing countries could come in unaccompanied b technology, I had prognosticated i these columns that nothing much woul happen, and so it has transpired. A that the scheme, which is supposed t benefit the core sector industries, ha yielded so far is a solitary joint ve ture in cement. The Arabs seem to b interested only in quick-yielding pr jects, which means hotels. It has no been decided, in what is apparently surrender to harsh realities on th ground, that the Indian hotel industr can avail of the facility of 100 per cen financing by the Arabs, 40 per cent i the form of equity and 60 per cent loans. If the country is seriously interested in attracting the individu Arab investor, it will have to make investment more attractive by somewh loosening the constructive regulatio relating to equity participation, ta ation and repatriation of profits. Otherwise also it seems that it would perha be more fruitful to concentrate effort on attracting Arab institutional rathe than individual finance. Such instit tional finance. secured hopefully concessional terms, could be funnell into our public financial institution To the extent inflow of foreign capit adds to money supply in the econom it has an inflationary impact who containment depends on the judicio ness with which the corresponding a cretion to foreign exchange reserves utilised by the Government.

More uranium for nuclear power

By P. C. MAHANTI

URANIUM mining in eastern India in Singhbhum district of Bihar specially is going to get a big boost with the Uranium Corporation of India's plan to work a relatively large deposit in Bhatin near Jaduguda where the Corporation's existing ore treatment mill is located. The capacity of the mill to treat the ore from Bhatin will also be suitably expanded. The project as a whole will cost Rs 8 crores. It is a three-year plan which incidentally highlights the importance of eastern India as a storehouse of minerals both economic and strategic.

The corporation's schemes to open new and separate mines and mills in Turamidih and Narwapahar, some 10 km away from the existing Jaduguda complex, at a total cost of Rs 91 crores have also been cleared. A nickel recovery plant forms part of these new projects since ore in the proposed mines is said to contain nickel as well.

These projects are meant to raise the output of uranium ore together with the production from mines in other parts of the country to meet the requirements of the country's nuclear power programme. The Government has set a target of 1,000 mw for nuclear energy by 2000 AD. According to an expert a 400 mw nuclear power station — the type of power stations being set up in India today — would require 60 tonnes of uranium per year. Accordingly output increases are being planned by the Uranium Corporation to feed the growing nuclear electric capacity in the country.

EASTERN INDIA TODAY

The uranium ore in Singhbhum is not of very high grade. It has a mineral content of only 0.067 per cent as against 0.1 and 0.2 per cent in other countries. Since economic minerals like copper, nickel, molybdenum and magnetite are also associated, though in small quantities, with the ore the Jaduguda complex has been running at a profit by selling these minerals in the market. It earned Rs 58 lakhs from these sales last year. The Jaduguda mill has facilities to recover these minerals at the same time as it is processing the uranium ore which is its main function. The proceeds from copper and other minerals are contributing substantially to the profit the Uranium Corporation has been earning. It also claims to have invented a low-cost ore processing method, all on its own, and the mining technology is now wholly indigenous.

Industry ministers' meet

The conference of industry ministers of the North-Eastern region held in Shillong recently was marked by a high seriousness of purpose — the seven governments of the region are anxious to promote industries in their territories as best as they can. The Industry Minister, Dr Charanjit Chanana's announcement that the capital investment subsidy for entrepreneurs will be enhanced from 15 per cent to 20 per cent has created the impression that the Centre, especially the Prime Minister, is keen to see the region growing industrially fast. The Industry Minister has stated that the industrial potential of the region is great. Only powerful catalysts are needed to bring about the necessary stir of growth. To begin with testing centres and raw material buffer stock depots will be set up in the region but the states concerned must revitalise the existing institutions for growth and must set up at the same time all necessary management and technical institutions. The North-Eastern Council should do its bit in collaboration with reputed management institutes too.

Power generation and small industries would necessarily get priority in any scheme of economic growth here. The conference has taken decisions to set up several micro-hydel units which could become operational in a short time. A standing committee of the small scale industries board for North-East region has also been set up with Mr P. A. Snagma, Union Deputy Minister for Industries, as chairman. He hails from the region and has been advocating immediate measures to develop the region's rich forest resources. The standing committee will prepare schemes to help all intending entrepreneurs launch their ventures within as short a time as possible.

Lack of adequate communications has been a serious factor behind the regions slow industrial growth. Rail communications in particular is poor. In the Union Territory of Arunachal Pradesh, for instance, there is no railway line yet. However, steps are being taken to remedy this serious deficiency. Some six new railway lines will be constructed during the current year at a cost of Rs 12 crores. The total length planned is nearly 210 km of which nearly 40 km will be in Arunachal Pradesh.

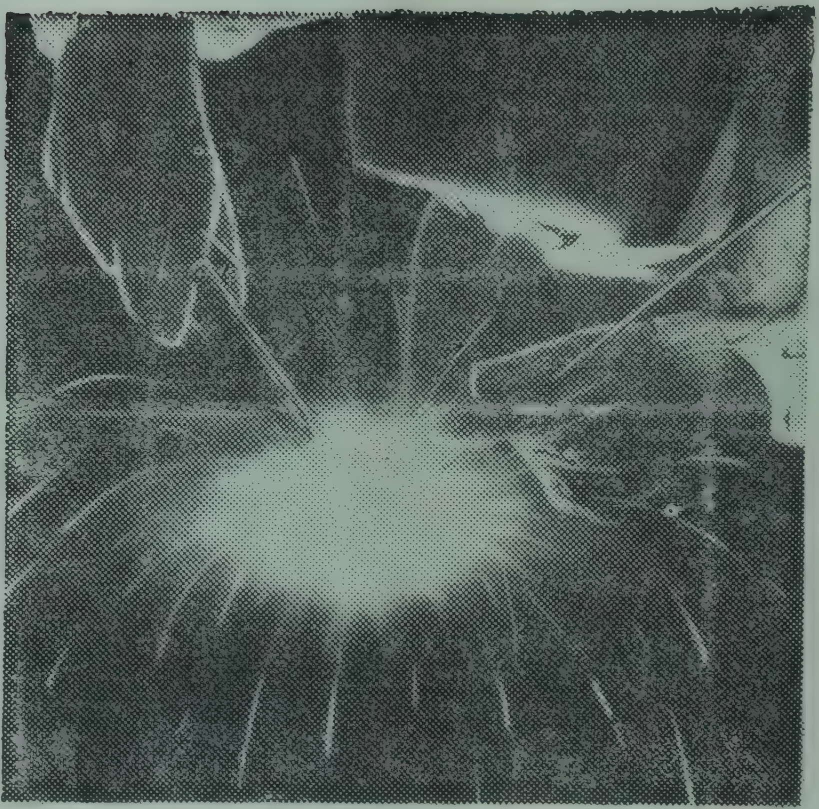
Declining importance

The importance of Calcutta as an international airport seems to be declining. Of the four international airports in the country it has now slipped to the third place after Bombay and Delhi. According to the latest report of the International Airport Authority of India, covering 1980-81, Calcutta had only 7,619 aircraft movements on the international side and 14,188 on the domestic side against Bombay's 27,331 international and 21,707 domestic and Delhi's 13,343 international and 16,693 domestic aircraft movements. Only Madras lagged behind Calcutta with 2,912 international and 10,326 domestic.

Passengerwise Calcutta fell even further back. It had a total of 300,156 passengers on international flights and a little over one million on domestic flights whereas Bombay had 2.8 million passengers on the international side and to 2.3 million passengers on the domestic side and Delhi 1.57 million passengers and 1.47 million passengers on the international and domestic sides respectively. In cargo traffic Calcutta's share of the total was a mere 6,600 tonnes on the international side as against Bombay's 69,000 tonne Delhi's 32,000 tonnes. Even Madras had 18,700 tonnes. On the domestic traffic Calcutta's share was 10,400 tonnes compared with nearly 22,000 tonnes for Bombay and 16,600 tonnes for Delhi. Here Madras lagged behind.

If the Airport Authority of India is providing less for the development and modernisation for Calcutta than what it does for Bombay and Delhi airports it cannot be blamed. Moreover, Calcutta airport is a losing institution with little prospect of only great increase in traffic despite the fact that it is the aerial gateway to the Far East and South-East Asia. Calcutta airport's prosperous years were in the late 60s and early 70s when so many gigantic industrial projects in foreign collaboration were coming up at once. It is difficult to see what else but a massive industrial investment can bring back the old prosperity. If much-talked about Paradeep steel project really materialises and the modernisation and development of Durgapur steel plant are carried out expeditiously (press reports have it that Durgapur's modernisation programme costing Rs 1,000 crores has been cleared by the Steel Authority of India) then Calcutta airport prospects may be altered for the better soon.

WHEN OUR WELD IS DONE,
IT'S ALWAYS WELL DONE.



For over three decades, we've been known as welders to the nation.

With good reason.

We've set the pace in welding by performing the most difficult jobs.

We custom-build equipment. Backed by the widest range of consumables.

We're geared to meet the demands of future growth at a rapid pace.

No wonder our oldest customers are still with us today. While we go on adding new ones every day.

Both here and abroad.

Our brands are standardised in most projects. What's more, whenever a special project called for a specialised welding product, we've almost always succeeded in tailor-making it. Thus avoiding costly imports.

These are things that are helping us pioneer enormous quantum leaps in the country's technology. Assisted by the world leaders in welding themselves: Oerlikon Buehrle, Switzerland.

Complemented by the largest range of welding products and services in the country. As well as the widest marketing network, comprising 12 area offices and over 400 dealers. Backed by efficient after-sales service. And deliveries which are linked to the most efficient manufacturing capacity in the country.

It is this thrusting dynamism of Advani-Oerlikon that is giving direction to India's welding industry—making it go exactly where it is growing: everywhere!

No wonder so many uncommonly sophisticated companies have Advani-Oerlikon in common: Indian Space Research Organisation, Rashtriya Chemicals & Fertilisers Ltd., Heavy Vehicles Factory, Gun Carriage Factory, Ordnance Factories, Associated Cement Companies Ltd., Walchandnagar Industries Ltd., Buckau Wolf New India Engg. Works Ltd. and Godrej & Boyce Pvt. Ltd.

ADVANI-OERLIKON KNOWHOW KNOWS HOW.

ENERGY

India's plan to develop new sources

From Our Special Correspondent

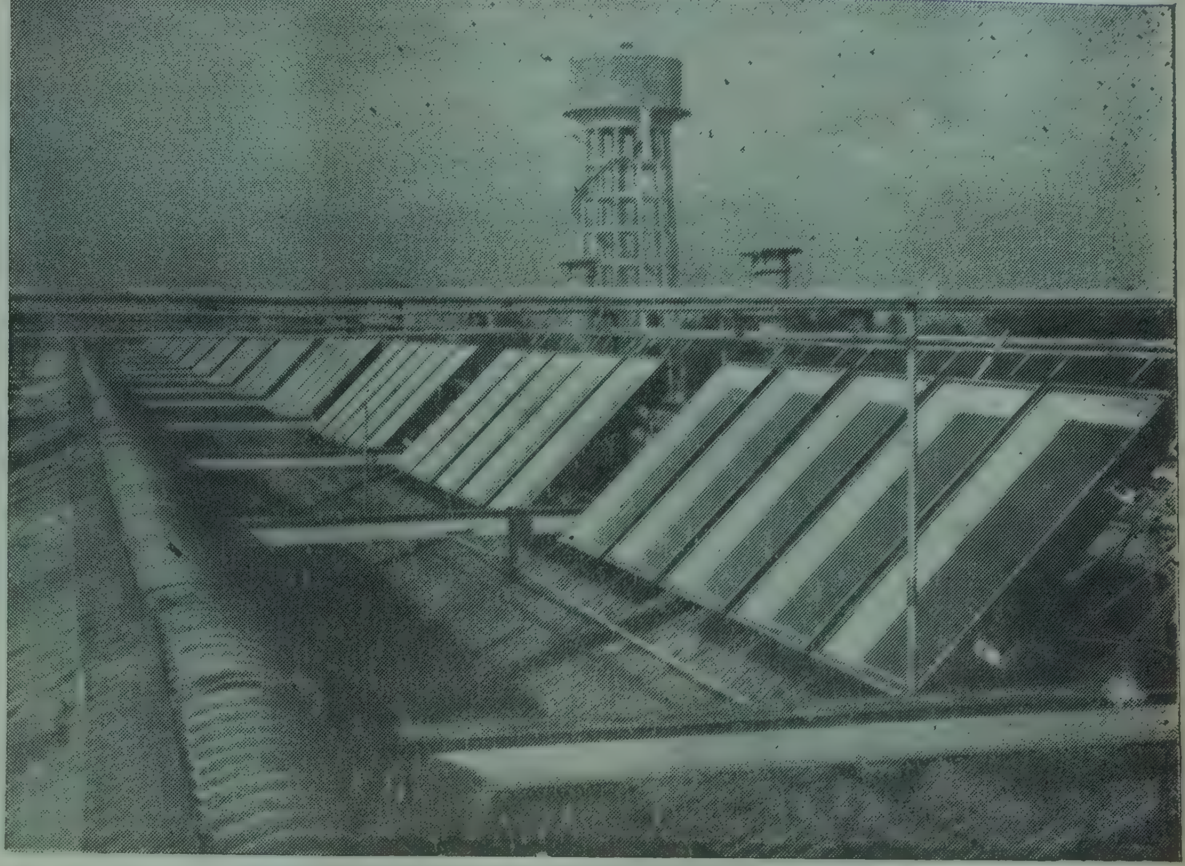
NEW DELHI

A NATIONAL paper prepared by India for the United Nations Conference on New and Renewable Sources of Energy, to be held in Nairobi, outlines the national plans for the development of new and renewable sources of energy and foresees these sources of energy playing increasingly a greater role in the total energy demand of the country.

It says that the sharp increase in oil prices, uncertainty in supplies, difficulties in producing and transporting increasing amounts of fossil fuels, environmental degradation caused by conventional fuels are among the factors which have led India to focus attention on renewable energy sources. The main sources of renewable energy of importance to the country are hydro-power, solar energy, bio-energy, wind energy, ocean energy and animal energy. Of these bio-mass as a fuel and animal energy for mechanical work and transportation have been known and used in India since time immemorial. Solar energy used for application such as drying has long been part of Indian way of life. The utilisation of hydro-power in a significant manner began only in this century though its use for motive power has been known in the hills in ancient times. Bio-gas is being used as a fuel since the last few decades. Serious efforts to utilise solar and wind energy begin only after the oil crisis in 1973.

Outlay

The Sixth Plan envisages a significant increase in the allocation for research and development and demonstration programme in all these areas. An amount of Rs 400 million had been allocated for this purpose in the years 1980 to 1985 in addition to Rs 100 million for a project relating to magneto-hydro-dynamic power generation and other new technologies based on coal. This may be compared with an amount of Rs 46.67 million actually spent by the Department of Science and Technology from 1974-75 to 1979-80 on R & D programmes for the new and renewable sources of energy.



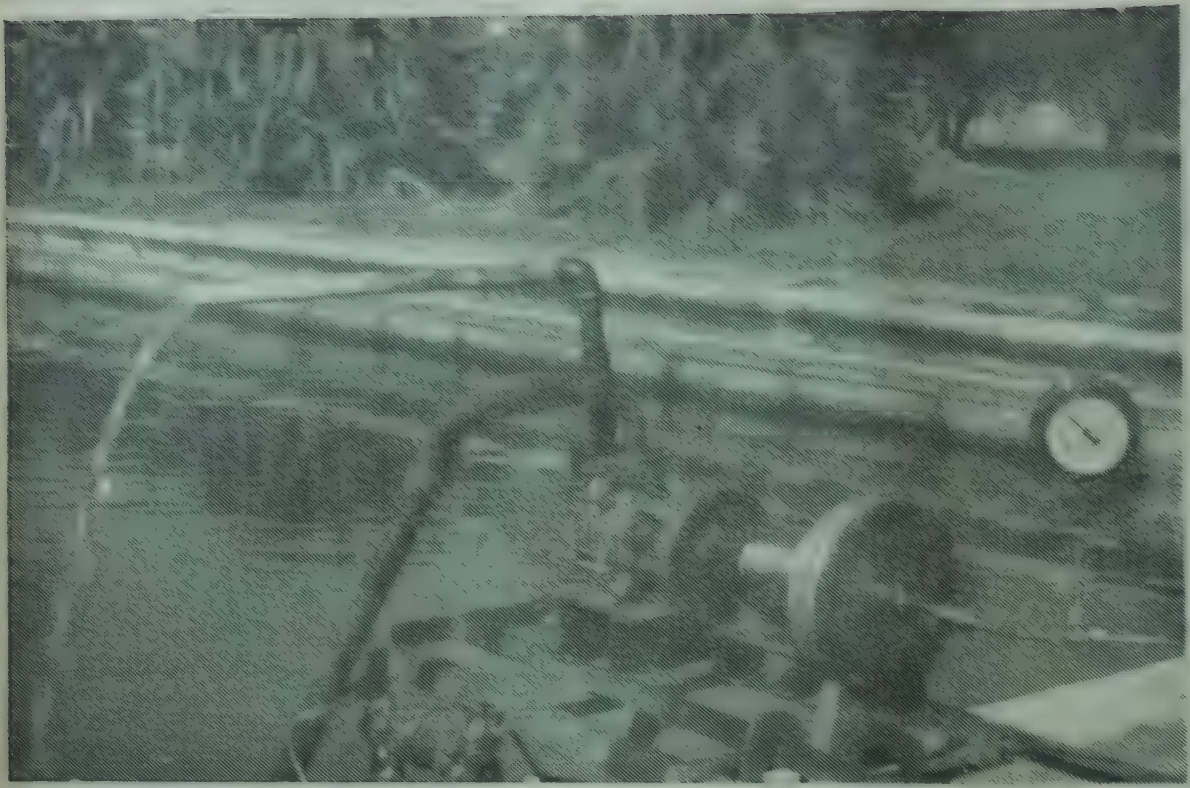
Solar panel providing energy to a textile mill

The significant increases being planned in this area may be judged by the fact that the outlay during the first year of the Plan (1980-81) was Rs 22.5 million (revised to Rs 24 million) while the outlay for the second year has been proposed at Rs 70 million. A separate allocation of Rs 500 million has been made in the Plan for schemes on fuel and farm forestry.

The government also proposes to promote the wider utilisation of renewable energy systems through various incentives, subsidies, etc. The Plan provides for Rs 500 million to be spent on subsidies and some supporting facilities for the establishment of family bio-gas plants. Prospective owners of bio-gas plants also have access to loans from the banks and other financial institutions. The budget proposals of the Union Government for the year 1981-82 include provision for accelerated depreciation on machinery or plants installed for the manufacture of renewable energy systems and devices; users installing such systems for professional or business purposes will also have the facility of accelerated depreciation of these systems. The Government has recently announced exemption of solar, bio-mass and wind energy devices and systems from excise duty; other incentives including loans on suitable terms are under consideration. This promotional package together with cost reduction to be achieved through technology improvement and large-scale production should make renewable energy systems economically competitive for certain types of application, with systems based on conventional sources.

The United Nations is organising a conference on New and Renewable Sources of Energy in Nairobi from August 10 to 21. India is attaching considerable importance to the conference. The Prime Minister, Mrs Indira Gandhi, is scheduled to attend the Nairobi meet.

Research and development activities in the area of new and renewable sources of energy will be intensified in the Sixth Plan. At present the Department of Science and Technology is funding R & D programmes which are being executed by over 40 national laboratories, public sector undertakings, Indian Institutes of Technologies and universities. A large number of research groups have been developed. At present there are several hundreds of scientists and technologists on a variety of areas covering bio-gas, bio-conversion, photo-voltaic devices, solar thermal systems, wind mills, hydrogen energy, batteries and battery-powered vehicles and integrated energy systems. This infrastructure will be strengthened and support extended to competent research groups throughout the coun-



Bio-gas driven pump

try. While all problems pertaining to renewable energy utilisation will receive attention. The areas which will receive priority include the following :

(i) bio-gas production and utilisation at lower costs and with different feeds in different agro-climatic conditions;

(ii) fast growing trees; petro and other energy crops;

(iii) bioconversion technologies;

(iv) solar thermal systems for low and medium temperature domestic and industrial applications;

(v) windmills for pumping water and lower power generation;

(vi) development of solar grade silicon and economic methods of solar cell production;

(vii) solar photo-voltaic applications;

(viii) development of prime movers for use with solar, wind and bio-gas sources;

(ix) energy storage systems;

(x) hydrogen production and storage;

(xi) electric vehicle development;

(xii) energy conservation and more efficient ways of utilising conventional sources;

(xiii) micro and mini hydel and low head hydel plants; and

(xiv) ocean energy plants and technologies.

In addition to research funded directly by the Government it is expected that several public and private sector organisations will take up the R & D programmes for various applications.

Additional Energies Commission

Essential element of any strategy for the development of new and renewable sources of energy would be an appropriate institutional arrangement which can prepare policy, co-ordinate its implementation and generate awareness. The Government has recently established a Commission for Additional Sources of Energy and the Commission will formulate policies and programmes for development of new and renewable sources of energy, coordinate and intensify research development activities in new and renewable sources of energy and ensure implementation of the government's policies in regard to all matters concerning new sources of energy.

Demonstration and awareness programmes

The efforts on research and development put in so far have resulted in the indigenous development of some renewable energy systems which have crossed the laboratory stage and are ready for large-scale demonstration and field evaluation. The Department of Science and Technology has launched a programme of demonstration of various renewable energy systems with a view to evaluating the performance of various devices and systems developed in the country in field conditions. The demonstration programme at present covers solar water heating systems, solar driers and kilns, solar refrigeration systems, solar distillation units, photo-voltaic systems for pumping, lighting and other applications wind mills and wind generators, community bio-gas plants and battery-powered vehicles.

Among solar thermal systems, water heating units have been installed or are under installation at several locations including hospitals, hotels, bakery and dairy units, textile mills, etc. Many units have been installed on a commercial basis. Units for drying grain, cash crops, timber, milk, tobacco, and veneer have been set up at several locations. Cold storage units for certain crops are being installed.

Solar photo-voltaic pumps which can be used for micro-irrigation and drinking water supply have generated widespread interest in the country. By February 1981, six such pumps had been installed at various locations including two villages. It is expected that about 70 pumps will be installed by the end of 1981. Some of the initial pumps will be set in agricultural universities and similar establishments from where it would be possible to obtain necessary data on the performance. As the production of photo-voltaic pumps picks up, it is expected that several thousand pumps will be installed in the country, initially for demonstration purposes and later on a commercial basis, as the costs of the pumpsets come down through R & D efforts and large volume production.

The country's first solar photo-voltaic lighting system has been set up in Choglamsar village of the Ladakh region in the State of Jammu and Kashmir. Another village energy centre utilising photovoltaic panels to power lights at a community centre and a community TV set has been commissioned in the Charsarhati village of West Bengal. Demand for photo-voltaic systems for specialised application such as off-shore platforms, communication TV sets and rural telephones has been increasing recently.

The first community bio-gas plant in the country was established at Kodamanja village in the Karimnagar district of Andhra Pradesh in 1976, and was financed by the Rural Electrification Corporation. A "co-operative" plant was set up in 1974 under the technical guidance of the Khadi and Village Industries Commission to provide gas to some staff quarters at a sugar factory at Vuyyur in Andhra Pradesh. Another community bio-gas plant was established by the Planning Research and Action Division of the Uttar Pradesh State Government at Fateh-Singh-Ka-Purva village. About 20 community bio-gas plants are now being established at various locations in the country under a programme sponsored by the Department of Science and Technology. The plants will provide gas for cooking and lighting as well as for running engines, pumpsets and generation of electricity. They will provide benefits to all sections of the community they serve, irrespective of income levels, cattle ownership and social status.

Significant demonstration programmes will relate to integrated energy systems for rural areas. While R & D efforts in this direction are still going on, such integrated systems are to be constructed in a few locations in the country during the Sixth Plan. Depending on the local meteorological conditions and the availability of material, these systems will consist of bio-gas plants, wind mills and solar photo-voltaic and thermal systems. It is hoped that such decentralised systems will meet to a large extent the energy requirements in rural communities. The decentralised units will provide lighting for homes and streets; fuel for cooking and heating water; motive power for pumps to provide water for irrigation and drinking; motive power and electricity for applications such as grinding and local industry; and low grade heat for cottage industry. It has already been demonstrated that bio-gas could be collected in large bags and fitted to tractors which can run on the gas. This opens up possibilities of providing fuel for mobile mechanical work also.

The response to the renewable energy systems already installed has been good. When a comprehensive scheme of incentives is implemented, there will be no doubt be widespread demand for these systems. The growth in awareness also generates additional demand. If this can be matched by a suitable capacity for production and by an infrastructure to distribute, install and maintain the systems, it should be possible for modern renewable energies to increase their contribution to the total energy demand to a very significant percentage.

TRANSLATING PLANS INTO ACTION

Maharashtra's Determined Efforts To Better The Lot of the Poor

Poor masses are the backbone of democracy.

It is therefore the bounden duty of every democratic Government to make conscientious efforts to bring about all-round development of the poor masses as speedily as possible.

The Government of Maharashtra have during the past eleven months, taken a number of decisions aimed at bettering the lot of the poor and downtrodden and have made determined efforts towards their quick and successful implementation.

Time-bound programmes have been formulated to remove regional imbalances in the state.

14-point programme for development of Vidarbha, 5-point programme for the Konkan region and 35-point programme for Marathwada have already been put into action.

Special schemes have been devised for the development of western ghats.

For the first time in the history of the state rain-water flowing westwards from the western ghats will now be harnessed for generation of electricity and irrigation.

The Sanjay Gandhi Niradhar Anudan Yojana and the Sanjay Gandhi Swavalamban Yojana, the two prestigious schemes of the new Government, have proved to be a boon to their respective beneficiaries, the old, invalid, infirm, destitutes and the like and the unemployed youth both educated and uneducated.

A sum of Rs. 73,24,871 has been distributed so far to 38932 persons under the Sanjay Gandhi Niradhar Anudan Yojana.

The beneficiaries of the Sanjay Gandhi Swavalamban Yojana number 18212 to whom an assistance of Rs. 3,46,48,811 has been granted.

Indira Gandhi Pratibha Pratisthan is yet another unique scheme.

This Foundation aims at extending a helping hand to needy and deserving budding artists and honouring the established and reputed ones for their outstanding contribution in the field of art and literature.

The Government has always kept the interests of the poor upermost in its mind.

Upliftment of the poor and the downtrodden is the avowed goal, for realisation of which the State Government is making all-out efforts. Indeed it is a relentless crusade against poverty and socio-economic injustice.

Energy for every hearth

By ENRIQUE IGLESIAS

INDUSTRIALISED and developing countries alike are affected by growing energy demands as they work towards their goals of economic and social development. Supplies of commercial fuels such as petroleum and coal are beset by uncertainties, and threatened with depletion as the demand from the modern section continues to grow. In rural areas, supplies of commercial fuels are much more limited and the increased energy demands have resulted in rapid degradation and depletion of biomass resources. This has caused what is known as the "second energy crisis", namely the fuelwood shortage.

In order to solve these problems, a new approach to energy sources is urgently needed. And it is the responsibility of humanity to ensure that this transition is rationally planned and executed through a marshalling of national resources and international co-operation. The UN Conference on New and Renewable Sources of Energy represents a momentous step, because it is the first concerted, global effort to plan a rational energy future for the world.

Preparations for the conference have been under way for over two years. International technical panels have met to discuss the current state of development and the future potential of the various sources to contribute towards national and world energy requirements. *Ad hoc* groups of experts have examined the roles of national policies, international financial agreements, and financial institutions in promoting the use of new and renewable sources. Building on the work of the technical panels and *ad hoc* groups, a synthesis group generated a comprehensive assessment of the technological and economic prospects of new and renewable energy sources as well as the constraints and problems involved in their application.

Among new and renewable technologies, the synthesis group identified mini hydro, small-scale solar and biomethanation as already feasible and available for rapid and decentralised proliferation. Large-scale hydro, geothermal, wind, and to some extent tidal power will continue to play important roles in centralised networks which benefit principally urban areas. The prospects for other biomass and peat technologies such as the production of solid, liquid and gaseous fuels are of considerable interest.

Small-scale solar technologies for water pumping and distillation, low temperature heating, cooking, crop drying and power generation are available and are expected to play a significant role in the near future. Small and medium-sized windmills used in a decentralised system are already economically competitive in many areas, whereas medium and large windmills are expected to be attractive enough for autonomous and integrated use in windy areas.

Other new and renewable technologies such as ocean thermal energy conversion, geothermal energy, large scale solar power, tar sands and oil shales are very promising. With suitable support for research, development and demonstration, these could emerge as significant options in the short-and medium-term future.

Overcoming the constraints which hinder the use of new and renewable sources is perhaps the main focus of the conference. The synthesis group found that the principal constraints concern policy, planning and institutional issues. Most countries do not have energy information available to undertake long-term national energy policies that take into account the development and use of new and renewable energy sources as a whole within their own overall energy perspectives. Such a long-term policy is essential because there is usually a considerable time lag between decisions related to energy and their implementation. Accordingly there must be a long-term political commitment by governments to tasks such as research and development, or raising awareness of new and renewable sources.

Relatively few developed and developing countries have so far formulated and implemented proper national energy policies. Where they do exist, energy plans are often characterised by assumptions of relatively cheap energy sources, or outdated consumption patterns of oil or other fossil fuels. Estimates for future energy needs are rarely based on adequate analysis of future demand, and planning for energy is often done independently of other sectors of the economy. Finally, many countries have not yet adequately considered the energy potential of renewable sources and their favourable implications for overall development objectives.

However, the constraints identified in the synthesis report are not absolute barriers to the greater immediate use of new and renewable sources in any country. These barriers can and should be tackled effectively through appropriate and urgent national, regional and international action. Precisely what kind of action will be determined by the course of negotiations in Nairobi ? But speaking for the secretariat of the conference, there are several major thrusts in which it is important that this conference have an impact.

We want to create awareness of the energy issue, its relationship to development and to the real needs of both the developed and the developing countries. If we can alert public opinion to the gravity of the energy problems of the developing countries (for example, the severity of the fuelwood crisis) and thereby create a climate of political will for change, we will be moving in the right direction. Simultaneously, of course, the potential contributions of new and renewable sources to developed countries should be made known.

The conference must also aim at efforts at the national level. Many energy problems are internal and hence require internal action and real change. We need, for example, to assist governments to obtain innovative institutional mechanisms and to give them greater access to information and data in order to make the right decisions.

At the same time, the conference should give impetus to international co-operation. In the area of traditional energy resources, much more is needed to help alleviate the fuelwood crisis. A very modest start has already been made, in which the World Bank and the International Development Association are involved. In addition, some bilateral assistance has been directed to the problems of fuelwood. But much more must be done.

International co-operation on the energy problems of modern societies has to be intensified to speed up the entry of new technologies into the energy balance. Another point is the need to stimulate international assistance through the transfer of financial and technical resources of developing countries to support training, energy research and technology transfer.

Finally, the conference can do much to promote a strong co-operative effort within the United Nations system. In a way, the conference will actually begin only after we have left Nairobi, because it is then that concerted action will start. If this action is fruitful, it will benefit the whole of humanity and will contribute to the construction of a true and lasting new international economic and social order.

Is bio-gas a life-belt for the rural poor?

By A SPECIAL CORRESPONDENT

NEW DELHI

DURING the sixth five year plan (1980-85), there will be a major increase in the number of bio-gas plants in the country. A sum of Rs 50 crores has been earmarked for setting up 10 lakhs family-size bio-gas plants. About 71,000 bio-gas plants are at the moment operating in the country. The Government is planning also to set up 100 community-size bio-gas plants as demonstration units.

Amongst the major sources of alternative energy, bio-gas is seen by India's onergy planners as the most promising at the current level of technological development.

The aim is to help villages become self-reliant for their fuel needs. By reducing the demand for firewood the bio-gas programme should also check deforestation and reduce the burning of cow-dung.

Bio-gas is mainly used for cooking but it can also be used for lighting, running diesel engines for irrigation and for generation of electricity. The use of bio-gas plants in villages, when linked to toilets, can also help in improving sanitary conditions.

Most of the funds allocated by the government will be spent on providing subsidies for the erection of family-size plants and for training people to construct them. Anyone setting up a family-size plant, gets a 25 to 50 per cent government subsidy. Community-size plants will probably be totally subsidised by the Government. But even this major programme will tap only a fraction of the country's total bio-gas potential.

According to Mr T. L. Sankar, the former Secretary of Planning Comission's working group on energy policy, in India cow-dung alone has a potential of 18.75 million family-size bio-gas plants and 5,60,000 community bio-gas plants, with a daily capacity of 1.7 and 142 cubic metres of gas respectively.

The one million target of family-size bio-gas plants under the sixth five year plan will, therefore, cover just five per cent of the potential capacity.

In order to realise the total potential, a great deal of research and development work is being undertaken.

Family-size bio-gas plants are beyond the purchasing power of over 80 per cent of rural families. Moreover, even if the government were to provide every family a bio-gas plant free of cost, the majority of families would still not have sufficient number of cattle to feed the plants. Only about 200 lakhs rural families own 3-4 head of cattle which is the minimum required to run a bio-gas plant.

There are, therefore, three major thrusts of bio-gas research in India, the first is to design and construct cheaper bio-gas plants using local skills and materials. The second is to find new feeds for bio-gas plants to supplement cow-dung. The third is to design and construct community bio-gas plants to suit even those who do not have cattle.

The most common design in India is the one developed by Khadi and Village Industries Commission (KVIC). It consists of an underground cement pit covered by a metal gasholder which floats over the gas produced in the cement pit by the fermentation of the cowdung. The metal drum in the KVIC design generally comes from an urban workshop.

A drumless design, known as the Janata model, has been developed by the Gobar Gas Research Centre of the Planning Research and Action Division (PRAD) of the Government of Uttar Pradesh at Ajitmal. The design is similar to the Chinese bio-gas plants. In this design, the gas holder and the fermentation pit are combined into one brick and cement structure. The advantages of this design are that it is as much as 50 per cent cheaper and it is possible for a trained villager to build the entire plant himself.

The Janata plant can also be built underground and water-hyacinth or some other feedstock can be cultivated on top of it.

But it is not possible to build community-size Janata plants. There are about 72,000 KVIC plants and about 2,500 Janata plants in the country. Technically, the main problem with KVIC model is the corrosion of the metal drum. In the Janata model, leakage can occur if it is not constructed properly.

The Application of Science and Technology to Rural Areas (ASTRA), Indian Institute of Technology (IIT), Bangalore, has modified the KVIC design so that it is possible to get gas within only 35 days of feeding the plant. The KVIC usually takes 55 days. The ASTRA has set up two plants on an experimental basis and claims that they are 40 per cent cheaper than the KVIC plant.

The A. M. M. Murugappa Chettiar Research Centre in Madras is designing a bio-gas plant in which the gas holder is made of PVC plastic.

The Structural Engineering Research Centre (SERC), Roorkee in Uttar Pradesh, has developed ferro-cement gas holders made of wire guage coated with cement.

The Tamil Nadu Agricultural University (TNAU) at Coimbatore has developed a mobile bio-gas plant.

Various institutions are experimenting in evolving substitutes for cement and steel. The KVIC itself is using lime pozzolana (a powdered mixture of slaked lime and brick waste) as substitute for cement for building the fermentation pit. This approach may reduce the cost of the plant.

Amongst the various new feedstocks that are being used in experimental plants are animal wastes like the excreta of cows, buffaloes, poultry, sheep and goats; human night soil; agricultural wastes like sugarcane trash, weeds, spoilt fodder and straw; and aquatic wastes like forest litter which mainly consists of twigs, barks and leaves.

The Punjab Agricultural University (PAU) at Ludhiana is using leafy materials like tree leaves, crop residues, fruit peels, chopped paddy and wheat straw to build what it calls *kachra* (waste) bio-gas plant.

The Indian Agricultural Research Institute (IARI) at New Delhi has been trying to use both animal and plant wastes. The National Sugar Institute at Kanpur in Uttar Pradesh, is utilising bagasse and cane trash. By adding methane-producing bacteria, the Maharashtra Association for the Cultivation of Science at Pune has made it possible to use dry oow-dung cakes.

Unfortunately bio-gas production slows down at low temperatures. People have higher fuel needs for making tea, etc during winter just when bio-gas output gets reduced. This is a major complaint in northern India.

To increase gas production during the cold months, the Regional Research Laboratory (RRL) at Jammu is experimenting with various solutions : building underground plants, adding solar-heated water and insulating the fermentation pit.

Several institutions are designing engines which can run on bio-gas for pumping water. A Poona-based private company, Kirloskars, is already marketing bio-gas engines in which diesel need have been cut by 80 per cent. The KVIC has designed an engine which runs solely on bio-gas. It, however, requires petrol to start.

There are only two community-size plants operating in Indian villages at present. The first community plant was located in Karimnagar district in Andhra Pradesh and went on trial run in 1977.

The second community-size plant has been built in Etawah district of Uttar Pradesh. The plant has been functioning since November, 1978. Gas from the plant is being distributed free to all the 27 households in this small village of 173 people. The earlier plan was to charge families for the gas depending on how many burners it used but later it was given free of charge as villagers were extremely reluctant to pay for it. They argued that cooking fuel previously cost them nothing.

Gas for cooking is supplied for 4-5 hours daily. Every family gets the same amount of cooking gas irrespective of the cow-dung it contributes. Burning of cow-dung has stopped and nearly all the cow-dung in the village is now used as manure. Gas was also used to power 17 street lights and 27 household electric connections for eight months in 1979 but then the generator had to be stopped because the villagers refused to pay for their electric connections : Rupees five per family per month for using up to two bulbs.

Gas is also being used to run a threasher, a flour mill, a chaff cutter and a tubewell. The villagers pay the current commercial rate in the area. About Rs 1,400 had been earned by end-1979 mostly from payments made by flour mill of higher capacity and oil-expeller, the revenue can be increased.

Research and Development efforts are needed to find cheaper pipeline materials for distribution of gas. It is also important to know at what point of the community's growth the distribution system starts becoming uneconomic.

According to Mr B. P. Ghate, the former Director of the Lucknow-based PRAD, the major problems with community-size plants are both technical and sociological. Organisational problems, like collection of dung and community financing of the plants, have to be studied in greater detail. Plants will be well maintained only when each member of the village community perceives it in his interest to keep it going. Voluntary organisations with village-based social workers will have to play an important role in the spread of community-size plants.

Most Gandhian rural development workers believe that bio-gas plants are extremely important because they represent a more rational utilisation of our country's community-based natural resources.

INDIAN DYESTUFF INDUSTRIES LIMITED

Registered Office : Mafatlal Centre, Nariman Point, Bombay 400 021

NOTICE

To

The Members,

INDIAN DYESTUFF INDUSTRIES LIMITED.

NOTICE IS HEREBY GIVEN THAT the 27th Annual General Meeting of INDIAN DYESTUFF INDUSTRIES LIMITED will be held at Ball Room Taj Mahal Hotel, Apollo Bunder, P.J. Ramchandani Marg, Bombay 400 039, on 16th September, 1981 at 4.00 p.m. to transact the Ordinary and Special Business mentioned in the Notice dated 23rd July 1981 convening the said Annual General Meeting. The Annual Report and Statement of Accounts for the Financial Year ended 31st March, 1981 are being posted to the Members individually at their Registered Address along with the said Notice together with the Explanatory Statement.

NOTES :

1) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND PROXY NEED NOT BE A MEMBER

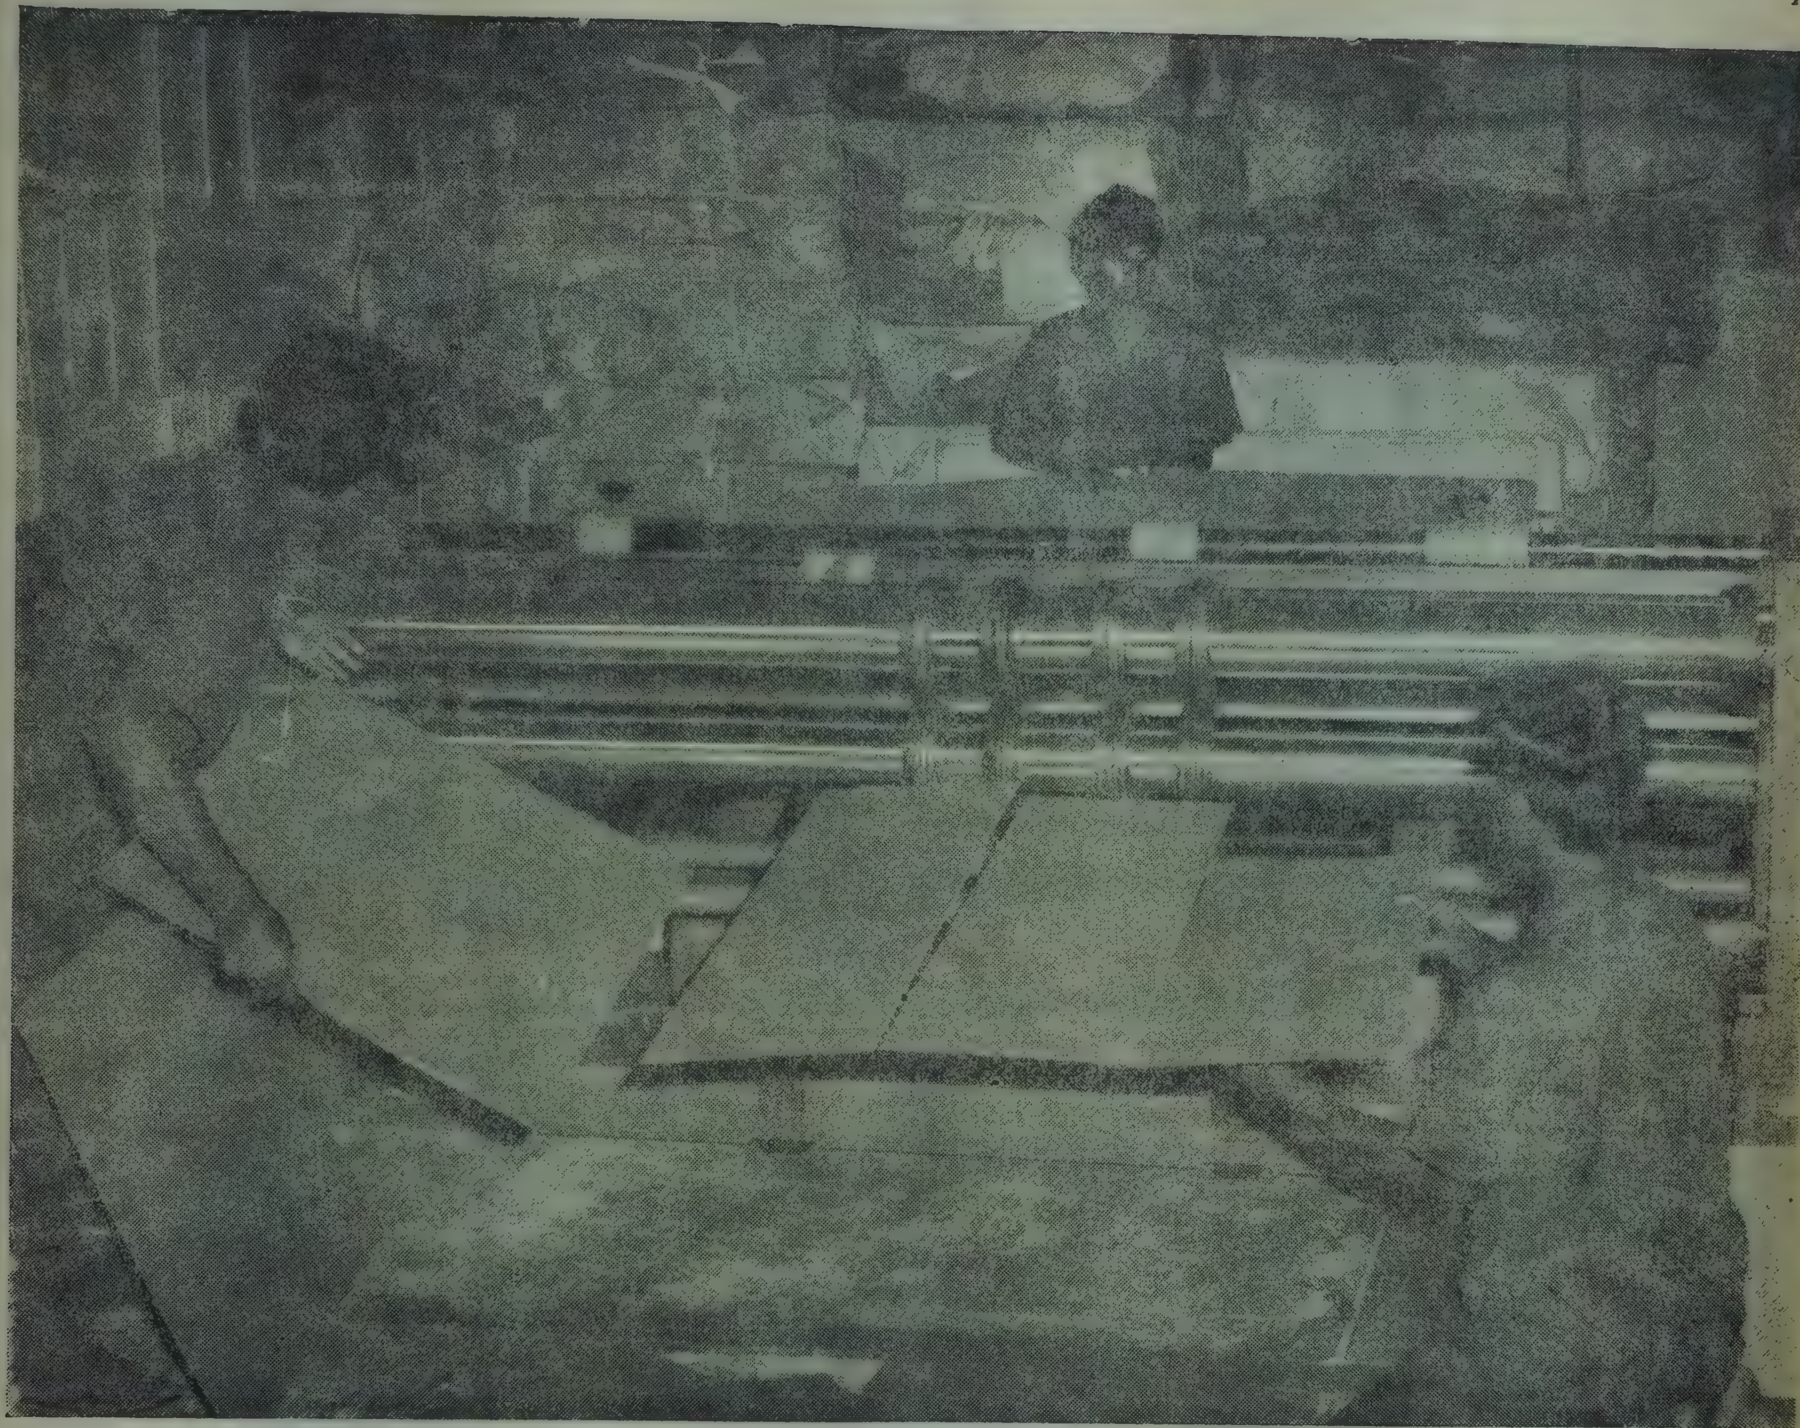
2) The Explanatory Statement relating to the Special Business mentioned in the Notice, as required under Section 173(2) of the Companies Act, 1956 is annexed to the Notice.

3) Members desiring to file Tax Exemption Certificate issued by the Income-Tax Officer or Statements in Form No. 14-B (in duplicate) pursuant to the provisions of Section 194 of the Income Tax Act, 1961 are requested to forward the same so as to reach the Company's Share Department at Rustom Building, 29, Veer Nariman Road, Bombay 400 023, on or before 4th September, 1981, in order to get the dividend without deduction of tax at source. It will not be possible for the Company to act upon such Certificates or statements received after that date. Blank Form 14-B will be supplied to the Members on request.

4) Members are requested to intimate to the Company change, if any, in their Registered Address

BY ORDER OF THE BOARD,
P. A. DESAI,
SECRETARY.

Bombay : 18th August, 1981.



One of the stages in the manufacture of particle board.

PAPER AND PAPER PRODUCTS

—A FEATURE

MPM is committed to paper. And meets the challenge.

MPM's Rs. 140 crore expansion now forging into reality

MPM, one of the oldest paper mills is fast becoming the largest — in one location, in the country. Nearing completion is its ambitious venture on paper, the Rs. 140 crore expansion programme.

Bhadravati has just now witnessed the high pitch activity of the erection and installation of the newsprint machinery. Best of brains from India and abroad are at work here, with technology from Finland and equipment from world leaders.

Right now hundreds of MPM men are at work to complete the most modern Chipper House, Pulp Mill, Coal Handling system, Electrical Distribution system and a variety of intricate and sophisticated networks. Forestry development in 75,000 acres in a phased plan is another challenge at hand.

All to ensure that MPM will soon reel out the story of newsprint, writing, printing and packing paper. Adding, annually, to the national resources 75,000 tonnes of newsprint and 37,000 tonnes of other varieties. Helping to narrow the supply-demand gap.

Progress-the medium is paper

Paper industry : Need for fresh incentives

By PRASUN K. DHAR

PAPER usage is the economic indicator of a nation's development. *Per capita* consumption of paper in India is a mere 2 kg as compared to 289 kg in the USA and 151 kg in Japan. Even developing countries like Malaysia (37 kg), Brazil (26 kg), Vietnam (27 kg) and Turkey (13 kg) far outstrip India.

Production

Production of paper and board in India was about 10.8 lakh tonnes during 1980 as against an installed capacity of about 15.3 lakh tonnes, representing a capacity utilisation of about 70.6 per cent. According to official sources, capacity utilisation was adversely affected due to power shortage, bottlenecks in wagon movement and inadequate availability of coal. There was, however, a marginal improvement in capacity utilisation over 1979.

Demand

The working group on paper industry, set up by the Government of India in 1972, has examined, among other things, the likely demand in the perspective of subsequent two plan periods. Considering the relevant factors, the group estimated a 7 per cent growth rate in demand for paper. Their demand projection is summarised in Table 1.

Demand projections have also been made independently by Planning Commission, Pre-investment Survey-India, NCAER and Marketing Research Corporation of India, but most of the estimates are on the high side. The present demand is actually about 11-12 lakh tonnes.

Experts predict a world-wide paper shortage in 1980s. Even without adjudging the validity of their hypothesis, the present gap between demand and supply in India is of the order of one lakh tonnes. Planning on the basis of a five kg *per capita* consumption by the year 2000 AD, production will have to be at least five million tonnes. This is a staggering figure.

Growth

The industry got a tremendous fillip in the first decade of planning but the growth tapered off, as illustrated in Table 2.

Stockpiles of waste paper

The figures indicate that in later years, specially in seventies, there has been marked hesitancy towards fresh investment in the industry. Installation of fresh capacity during the last few years has been nominal. The main reasons are said to be as follows :

(i) Return on capital invested is not regarded as attractive (the existing control on production is considered to be a deterrent).

(ii) Long gestation period.

(iii) Inadequate incentive (Government has declared fresh incentives in form of fresh excise relief for new units and for usage of bagasse).

(iv) Huge capital investment (about Rs 12,500 per annual tonne).

(v) Scarcity of raw materials.

(vi) Rising cost of fuel and other inputs.

The above indicates that a better investment climate is needed by this industry to induce fresh capacity. This calls for incentives like soft loans, higher debt equity ratio and excise relief. (Dr Charanjit Chanana, Minister of State for Industries, had announced fresh incentives in Parliament on April 24 last which should be a welcome relief to the industry).

The National Council of Applied Economic Research has recommended setting up of larger units on economic grounds. The Working Group on Paper Industry has also favoured setting up of

Table 1 : Demand projection for paper industry

Item	Estimated demand in '000 tonnes 1978-79	1983-84	1988-89

100 tonnes per day paper mills as the minimum viable size.

Capacity utilisation

The industry had an enviable record of capacity utilisation till 1970, but thereafter there has been a steady decline as is evident from Table 3.

Table 3 : Capacity utilisation in paper

Period/Year	Capacity Utilisation (%)
1951 — 1960	91.7
1961 — 1970	89.2
1971 — 1975	77.8
1976	79.3
1977	80.7
1978	78.0
1979	69.7
1980	70.6

Imports

With almost all common grades of paper and a large number of specialities being manufactured in the country, the import is limited to a few special items. During 1979-80 about 50,000 tonnes of writing/printing paper had to be imported to supplement the indigenous production which was short of demand. Since the demand has been steadily growing, the supply-demand gap is likely to widen further to the extent of at least 1,00,000 tonnes by 1982-83.

Two sectors

The paper industry had been basically in the private sector till the end of sixties. In 1975, the industry was included in the core sector and large industrial houses were allowed to participate in and contribute towards its development. Except for the production of newsprint, the entire production of paper and paper board is in the private sector.

Public sector entered the field of pulp and paper industry in May 1970 with the formation of Hindustan Paper Corporation Ltd, although it had been in the field of newsprint production, for example NEPA in Madhya Pradesh since 1958. Installed capacities and expected dates of commissioning of the four projects taken up by HPC are shown in Table 4 :

The total outlay for all these projects is likely to touch Rs 600 crores as against the original estimate of Rs 200 crores. Share of public sector in total production is likely to be about 10-15 per cent after the implementation of all the projects.

Raw materials

Bamboo and wood are basically the traditional raw materials for making paper. The other raw materials include agricultural residues like straw, bagasse, gunny, jute sticks and waste paper.

For the current production of 10 lakh tonnes of paper, total annual requirement of bamboo and timber would be about 19 and six lakh tonnes respectively. With increase in demand for paper, aggregate requirements of raw material for 1985, 1989 and 2000 will rise. However, it is expected that demand for bamboo between 1985 and 2000 will decrease comparatively, while that for coniferous and hard wood will increase substantially.

It has been estimated that total growth area of bamboo in the country is over 1 lakh sq km (100 lakh hectares) with an annual potential of 45 to 50 lakh tonnes. The estimated growing stock of wood is 46,600 lakh cubic metres. On the face of it, it may appear that there is paucity of wood whereas bamboo is available in plenty, but in fact it is just the reverse. The growth of bamboo is concentrated mainly in MP, Orissa, Andhra Pradesh, Karnataka and the north-eastern States. The bamboos from those states where infrastructure has been developed are earmarked for the industry, but a huge percentage of the total growth area lies in inaccessible and remote places. Since tropical pine plantations which were planned for Central India have not been fully achieved, lot of coniferous wood will not be available. Hence the projected demand of bamboo will rise and there is a likelihood of its shortage and not that of wood.

To solve the problem of raw materials shortage which looms over the industry, some of the suggestions are:—

1. A rational development and exploitation of forest policy by the Government, in consultation with the industry.

2. Adequate financing for development of forestry sector.

3. Exploitation of land by silvicultural operations including afforestation.

4. Prevention of theft and unauthorised felling of wood.

5. Sponsoring and promoting socio-industrial forestry programmes in joint sector. The Titaghur Paper Mills have taken a lead in this area.

Paper machinery

Manufacture of pulp and paper making machinery started only in 1960. There are 27 units licensed and nine units registered with DGTD for manufacture of paper and components of paper machinery. Indigeneous manufacturers are capable of fabricating complete pulp and paper plant of 150/200 TPD capacity. There is large idle capacity in the industry and there are no encouraging signs for the eighties, basically due to continuous recession.

It is believed that though an old imported machine costs about one-tenth of a new indigeneous machine, cost of rebuild, import duty, increased cost of input, lower yield etc make old imported machines a costlier proposition.

The existing facilities are adequate to build mini-paper plants of 10-30 TPD production.

Research and development

R&D is a vital function of any industry, continuous research is essential to update technology, facilitate innovation and encourage development. R&D should cover process design, process improvement, product improvement, diversification, minimisation of pollution, silviculture, import substitution, energy conservation etc. Stress should be laid on problems of vital national and international importance, like energy conservation high-yield pulping, quick-growing species etc.

Titaghur Paper Mills are carrying out intensive research work in various fields at their well-equipped R&D laboratory. Other Mills are also doing useful work.

Man-made forests: some basic issues

By I. M. BHANDARI

THE future of the paper industry has been adversely affected by inflation as well as shortage of basic raw materials. Increasing cost and shortage of coal, power, wagons, raw materials and chemicals have hit the industry very hard.

The current production of paper and board by end of 1980-81 would be around 10.50 lakh tonnes as against the installed capacity of 15.38 lakh tonnes. Although original estimate of the Planning Commission gave the demand for paper and board at 11.03 lakh tonnes by 1980-81, the figure has been revised to over 12 lakh tonnes now, increasing to over 16 lakh tonnes by 1984-85. The shortfall in supply is alarming and one of the reasons for the poor growth of the paper industry is shortage of proper type of pulpable raw material.

Forests in India occupy an area of about 75.2 million hectares, nearly 24 per cent of the total land area of the country and the current consumption of hard wood is around 18 lakh tonnes while the actual need would increase with the growth of the paper industry. Compared to agriculture, the contribution of forestry to the national income is quite low. In spite of substantial allocations of funds under the five-year plans, the current production of wood from forests is many times less than the potential productivity of the forests.

It is gathered that the scope for raising the production capacity of forests is at least 20 times more than the present production. However, it is possible to increase the forest output by adopting measures for better conservation, management, tree improvement, irrigation and fertilisation. It is, therefore, imperative that separate working plans be drawn up for pulpwood supply instead of keeping the same annexed with general forest development programmes which will, to a great extent, solve the problem of supply of cellulosic raw material to the paper industry.

The paper industry requires young suitable wood of uniform size for pulping at economic landed cost. A large quantity of pines and hard wood and bamboos are not being utilised due to inaccessible terrain. This wealth cannot be usefully exploited unless proper communications are developed in difficult terrain at a high cost. But not only the availability, the economics of extraction and delivery at mill site of suitable quality of wood are also much more important.

To solve this problem, creation of man-made forests is suggested. This is a gigantic venture in itself. Considering the needs of future requirements of the paper industry, plantation of one million hectares of bamboo and one million hectares of pulpwood is proposed and for this, funds to the tune of Rs 350 crores may be needed in addition to the huge cost involved in building roads and extraction paths to inaccessible areas in order to make it possible to extract the virgin forest of woods and bamboos.

Both the Central and state governments are actively engaged in promoting

man-made plantations in the country. The National Commission of Agriculture, in its interim report, "Production Forestry—Man-made Forests" recommended dynamic changes in the forest policy for the country and it was found that around Rs 850 crores would be needed during the Fifth Five Year Plan for development of forestry. Nevertheless, the progress in this regard during the last decade has been very poor and except for new areas, no large scale afforestation programme has been undertaken.

Plantation projects need industrially-oriented infrastructure. Their implementation will be rather difficult departmentally by the state governments because of problems of labour laws, wages, management control and investment returns. Such projects can be better organised by autonomous quasi-government bodies or by the joint sector or the private sector. But before any such programme is successfully implemented, certain thoughts in this regard need to be emphasised Some of them are mentioned below.

Since man-made plantations involve large sums for a long period, return from them should be attractive enough to the investors. Unless this is made possible, no amount of persuasion or compulsion will make the capital flow in for such projects. This needs a serious thought by all experts of forestry financing and the government, and a rational approach is called for. The cost of bamboo with a spreadout rotation cycle of four years and life of 40 years would come to Rs 550 per tonne. Taking normal bleached pulp yield of 38 per cent on a.d. weight, bamboo (assuming 10 per cent moisture) cost of raw material per tonne of pulp itself will come to Rs 1,450. By no stretch of imagination can the industry bear this high cost of raw material.

The question of rent for the land for such plantations also needs careful consideration. Since raising of plantation takes time before it is ready for exploitation, initial heavy expenditure on its establishment has to be sunk by the industry. A suitable formula may be developed to charge land rent with the exploitation-rotation of each plantation so as to impose minimum burden on the industry and help initial stages of development.

A serious drawback in bringing up planned plantations of fast growing pulpable species is lack of technical know-how. It is necessary that every state has a full-fledged forest research centre of pulpable woods and silvicultural practice. These centres should be accessible to the industry as also to the forest officers. This would help bring up plantations on economic lines. Unless fast growing species yielding wood of suitable quality for pulping and accommodative to local climatic and soil conditions are planted, it will be difficult to achieve the desired object of raising industrial plantations. Thus, extensive studies in forestry science for each locality and particular species to be grown there are needed.

Man-made forests should be more intensive than extensive. Commercial exploitation always calls for higher yield, improved quality and processing economy. Since our forests have very poor yield, and raw material is not available in concentrated areas, it is necessary that before plantations are raised, basic principles of their layout, selection of site and species, ecological effects and industrial economy are well understood and accepted both in policy and principle.

Besides bamboo, selected fast growing species suitable for paper making such as *eucalyptus, Gmelina arborea Acacia auriculiformis, Melia azederach Ailanthus, Leucena glauca, paper mulberry, poplars, Sesbania grandiflora, Hibiscus canabinus* (*kenaf*), *Tropical pine* and similar others should be preferred to other plantations for the paper industry. *Prosopis juliflora* may be grown extensively in arid and degraded lands where regular plantations may not be possible. Younger trees give suitable woo for chemical grade pulp as found by us With smaller rotation cycles, the overal investments are low and the industry ca get best returns from such plantations whereas plantations of longer rotatio create many problems of managemen and investment.

Care should also be taken to selec sites for industrial plantation as near t consuming unit as possible, thereby helping to reduce the cost of raw material for industrial use. As far as possible, th distance from consumer units should b kept within 80 kms so that the costs c transport facilities, conveyance and management are effectively and economicall managed.

BAGASSE

Problems of switch-over

By Our Industrial Correspondent

TRADITIONAL sources of raw materials for paper manufacture are becoming scarce in this country. The obvious solution to this problem is the use of non-traditional materials like bagasse, hard wood, cereal straw, agricultural residues, cotton rags, cotton linter and waste paper. But the difficulty with most non-conventional materials is that they are not available in adequate quantities to sustain the working of a paper mill of normal size. However, India produces sufficient bagasse for paper manufacture. Its use as an alternative to bamboo for pulp production has thus been considered for a long time. It is theoretically possible to produce a million tonnes of paper from bagasse now being burnt as fuel by sugar mills in the country. Why then has the process of manufacturing paper from bagasse not got under way?

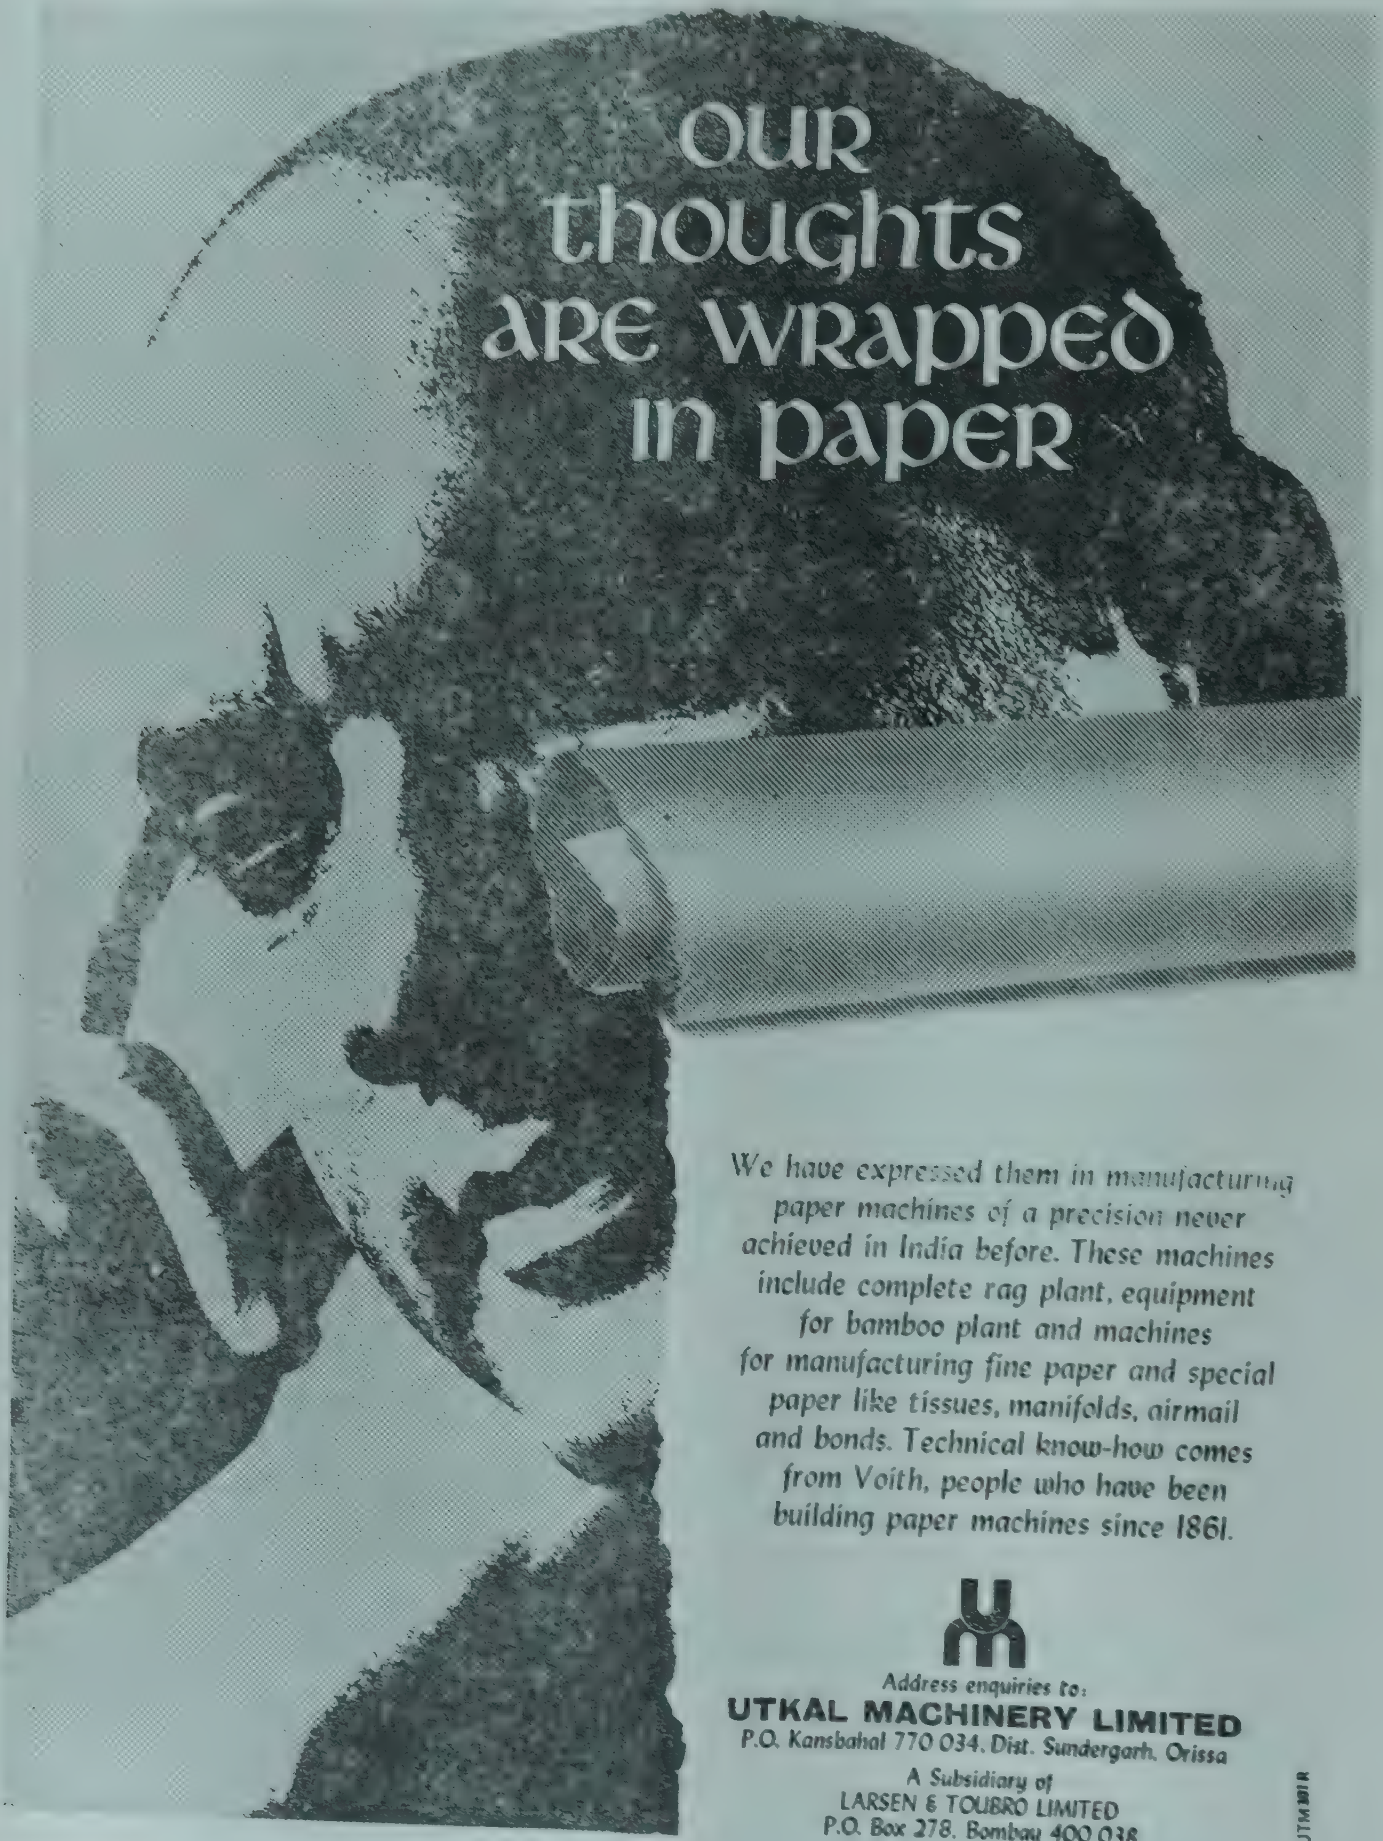
The Government has evolved a set of policy measures to promote the use of bagasse for paper production. Financial institutions have been directed to give priority assistance to such schemes. Excise rebates have been offered to units manufacturing paper from bagasse.

Several problems have held up the shifting of paper production from bamboo to bagasse. Sugar mills use bagasse as fuel and their boilers have been specifically designed to burn bagasse. If they are to release bagasse to the paper industry, their boilers would have to be revamped and coal- or oil-fired boilers would have to be installed. Coal and oil boilers are more expensive, and, while oil is scarce in the country, there is no guarantee that coal supplies for sugar factories will be ensured even though we have abundant coal resources. The experience of the cement industry has been a bitter one. The costs of conversion and transport of coal and oil are sufficient to deter sugar mills from making such a switch

Moreover, the proper technology for has not yet been evolved depithing bagasse for its use as a raw materia Bagasse is relatively high in pith conter (30 per cent). After the separation c pith, bagasse is pretreated and refine under heat and pressure conditions ar reduced to fibre. The process of reducir bagasse to fibre is relatively easy. It ca be achieved by installing pressure re ners and auxiliary equipment in existir sugar mills. It does not demand separa infrastructural facilities.

Another problem arises from t bulky nature of bagasse. It is availab for only six months during the suga cane crushing season. Paper mills usi bagasse as a raw material would th have to store their requirements of ba asse and this poses some problems. Va ations in cane supply position from s son to season, cane quality and fibre c tent also make the planning of pulp ur by sugar mills difficult.

But, all these problems can be solved if the intent to use bagasse paper production is strong enough. O sugar mills would need stronger inc tives to sell their bagasse to paper m or to themselves to undertake pulp p duction.



We have expressed them in manufacturing paper machines of a precision never achieved in India before. These machines include complete rag plant, equipment for bamboo plant and machines for manufacturing fine paper and special paper like tissues, manifolds, airmail and bonds. Technical know-how comes from Voith, people who have been building paper machines since 1861.

Turning a new page in paper industry

By K. JAYABHARATH REDDY

ANDHRA Pradesh, which is well known for its predominance on the agricultural front with its self-sustaining agricultural economy, is now emerging as an equally important industrially developing state on par with several other industrially developed states like Maharashtra, Gujarat, West Bengal and Tamil Nadu.

The encouraging and attractive industrial investment climate, the favourable governmental policies, the multi-pronged timely assistance extended by the different state level promotional organisations and, more particularly the vital catalytic role played by the premier industrial promotional organisation —the Andhra Pradesh Industrial Development Corporation (APIDC) — congenial labour relations, and a comfortable power position are some of the important factors responsible for the accelerated industrial activity in the State.

APIDC, set up by the Government of Andhra Pradesh for planned and rapid industrialisation of the State, has set a record achievement in the field of industry and the Corporation's stress on new dimensions of development in the different fields of industry have helped the State to turn a new page in the industrial chapter of the country.

The industrial spectrum of the corporation's projects include a large number of natural resource-based industries like paper and straw board mills.

Wealth from waste

The corporation's endeavour to fully utilise the rich agricultural resources, including the agricultural wastes/residues which were hitherto unutilised and wasted, has now become an important plank for industrial activity in the State, leading to the growth of paper and board industry.

Till 1975, there were only two large forest-based paper mills in the State namely A.P. Paper Mills Ltd at Rajahmundry in East Godavari district and Sirpur Paper Mills Ltd at Sirpur Kaghaz Nagar in Adilabad district, with an installed capacity to manufacture 60,000 to 70,000 tonnes per annum utilising the bamboo and hard wood resources of the State. Of these two mills, AP Paper Mills is being assisted by the Corporation, which has now a licensed capacity of one lakh tonnes of different kinds of paper, utilising about one lakh tonnes of bamboo and an equal quantity of hard wood.

First mini paper mill

In 1975, APIDC extended all-out assistance to a group of young entrepreneurs, having nearly a decade's experience in different capacities and aspects of paper making and management in a major paper mill in the State and who had left their lucrative jobs and had come up with a proposal to set up a mini paper plant in a rural area near Rajahmundry, Kadiam, in East Godavari District, a rich paddy growing area of the State, by utilising the abundantly available paddy straw and other agricultural residues like jute waste, cotton linters and waste paper for the manufacture of 2,500 tonnes of paper. It was in line with the corporation's endeavour not only to utilise the agro resources for industrial purpose but also to build up a self-sustaining local entrepreneurial base.

Besides supporting this proposal APIDC took up this project proposal to the Industrial Development Bank of India which, after a thorough examination of the proposal by an expert committee of paper makers, agreed and participated in shaping the first mini paper mill in the State, a joint venture of APIDC *viz.* the Coastal Papers Ltd. As a first venture of its kind in the State it received full support of public investors whereby the company's public issue was over subscribed. The technocrat combination of this unit had the added advantage of having their own designs, locally fabricated plant and machinery and the project cost not exceeding Rs 98 lakhs. They got the unit commissioned in a record time of 18 months. Additional success was obtained by achieving full production capacity and declaring a dividend in the second year of its operation. It is this successful

Mr K. Jayabharath Reddy

experience that has triggered the growth of paper industry and prosperity to all those concerned.

Growing demand for paper

There is an imperative need to meet the ever-growing demand for printing and writing paper in the country, promoting new paper mills by utilising the forest resources like bamboo and wood as well as the secondary resources like straw, jute/gunny wastes, cotton linters etc.

The spread of education, increased literacy standards, tremendous growth in the printing and publication industry, numerous newspapers big and small, and a tremendous increase in magazines and journals has enormously increased the demand for printing and writing papers. Simultaneously there has been an increase in the demand for wrapping and packing papers including paper board for industrial use.

The Sixth Five Year plan of the country has indicated that the demand for paper/paper board is estimated to increase from 1.1 million tonnes in 1979-80 to 1.54 million tonnes by 1984-85. The capacity and production targets envisaged for 1984-85 are 2.05 million tonnes and 1.5 million tonnes respectively. The plan also envisages the additional capacity to be set up largely through establishment of small sized paper mills based upon secondary raw materials.

It is in line with the Government of India's plan document that the APIDC has encouraged entrepreneurs to set up mini paper mills utilising agricultural wastes.

Efforts of APIDC

As a result of the catalytic role played by the corporation for promotion of paper mills not only based on the

forest resources like bamboo and debarked wood, but according highest priority to those entrepreneurs who have come up with proposals to set up mini paper mills based on the secondary raw materials like agricultural residues/wastes, like paddy straw, waste paper, gunny bags, cotton waste, baggasse etc for the manufacture of printing and writing paper, Andhra Pradesh has been placed on par with States like Maharashtra as far as the number of units is concerned.

As on date there are four large mills located one each in East Godavari, Kurnool, Khammam and Adilabad districts producing paper on a large scale utilising the bamboo and hard wood resources of the State. Out of these four units, three projects were promoted by APIDC; of this, one is in Joint sector with a project cost of Rs 47 crores. The industrial investment generated in these large mills will be of the order of Rs 126.10 crores, of which Rs 4.73 crores has been the corporation's share of investment.

In addition to these large mills which have already gone into production, the corporation is actively contemplating to set up the Kakinada pulp/paper project with an investment of the order of Rs 150 crores, based upon Andaman woods. Effective steps like preparation of market report, preparation of raw material report, location survey report, etc, have been completed in association with the Food and Agriculture Organisation of United Nations. In view of the huge investments involved, discussions are in progress with the concerned ministries to get the necessary assistance from an international organisation like United Nations Development Fund. When this project goes on stream, the unit would be able to manufacture one lakh tonnes of printing and writing paper per annum which will go a long way in combating the shortage of this important commodity.

Mini paper mills

The corporation has also been encouraging entrepreneurs who come up with proposals for setting up mini paper plants based on the secondary raw materials like the agricultural residues and wastes. As on date four mini paper plants are in production with a licensed capacity of the order of 30,500 tonnes per annum. The investment involved in these projects is of the order of Rs 15.41 crores. The corporation's share of investment in these projects is Rs 1.08 crores.

The corporation has encouraged 11 more entrepreneurs who have come forward with proposals to set up mini paper plants in different parts of the State, majority of them based on locally-available agricultural residues. However, two out of these 11 projects will utilise the commercial grade pulp sold by the Central Pulp Mills, a public sector undertaking. The licensed capacity of the mill under implementation is of the order of 67,525 tonnes per annum involving an industrial investment of the order of Rs 34.57 crores. The corporation's share would be about Rs 2.36 crores. By the end of 1983, almost all these mills will go into production.

The corporation has promoted so far five straw board mills, of which three have already gone into production with an installed capacity of 8,500 tonnes per annum involving an industrial investment of Rs 1.41 crores with corporation's share being Rs 16 lakhs. The other two mills have recently been accepted by the corporation for promotion with a capacity of 6 lakh tonnes per annum and with an investment of Rs 1.85 crores. These mills would utilise the abundantly available straw in the respective locations.

Raw materials

The principal raw materials like bamboo and wood for large paper mills come from the rich forest resources of Andhra Pradesh. The three paper mills promoted by the corporation consume as much as 2 lakh tonnes per annum of bamboo and 2.1 lakh tonnes per annum of hard wood valued at about Rs 12.30 crores.

The State has a forest area of 64,154 sq km, spread over 10 districts of the State. The raw material requirement of these major paper mills is met from the forests of East and West Godavari, Khammam and Bhadrachalam, and the Nallamalli forest range.

As a result of the sustained demand for the bamboo and hard wood by these major paper mills, the Andhra Pradesh Forest Development Corporation, an undertaking of the Government of Andhra Pradesh, is going in a big way in creating manmade forests for bamboo and hard wood supply in a phased manner. Till the end of July 1980 an additional land of 6,622 hectares has been brought under bamboo forest plantation.

The corporation has taken up an industrial plantation programme in a phased manner in the different forest range areas with a tie-up with the consumers. The corporation has drawn up perspective plans up to 2000 AD for different varieties of plantations like bamboo, teak, eucalyptus and other pulp woods.

The principal raw materials utilised by the mini mills in making paper are agricultural residues/agricultural wastes and other wastes.

It might be of interest to note the four mini mills in production will consume 55,500 TPA of paddy straw, 10,000 TPA of waste paper, 7,600 TPA of jute/gunny waste and 8,500 TPA of cotton linters for producing 30,500 TPA of printing and writing papers.

Out of the 11 mini paper mills at various stages of implementation nine units will ultimately consume 84,000 TPA of straw, 27,200 TPA of waste paper, 17,000 TPA of jute/gunny waste and 8,600 TPA of cotton linters for producing 67,525 TPA of printing and writing papers.

Straw board mills

The five straw board mills consume paddy straw of the order of 20,000 TPA, producing 14,500 TPA of boards. Besides the five mills supported by APIDC, there are a few more straw board mills in the State.

Andhra Pradesh being an agricultural State with more than 36.62 lakh hectares under paddy cultivation, with an average yield of two tonnes of paddy straw per hectare on single crop basis can keep up the abundant supplies of straw for industrial purposes, besides meeting the cattle fodder needs.

The process of encouraging entrepreneurs to set up paper mills based an agricultural wastes has improved the tempo of creating new employment avenues to the local people in various categories on the shop floor. The three major paper mills provide employment to more than 6,000 persons and the mini mills in production to 1,000 persons. The ultimate employment figures in these paper board mills would be more than 15,000. 15,000.

Besides the shop floor employment avenues many more employment opportunities are created in the connected acti-

vities like forestry, raw material collection/processing activity, transportation, and ultimately to a large number in the downstream industries.

Entrepreneurial base

The creation and strengthening of a strong and sustained local entrepreneurial base is achieved to a reasonable extent in promoting these paper mills.

The establishment of a chain of agro-based mini paper mills has once again strengthened the theme that "a developing state is one which creates wealth out of its waste while an underdeveloped state is one which wastes its wealth."

The setting up of paper mills in the green belt of the State has resulted in bubbling new economic activity. The benefit of industrialisation has started reaching the rural folks by reducing the regional imbalances and employment avenues round the year unlike the seasonal avenues.

Contribution to economic development

Today AP's contribution to paper production is of the order of 2.22 lakhs TPA which would ultimately reach 2.90 lakhs TPA by the end of 1983. With the commissioning of the Kakinada pulp project, this would further go up to 3.90 lakhs TPA. The value of paper produced by the three major mills and the 14 mini mills would be of the order of about Rs 141 crores. In this process of paper making the paper mills will consume straw valued at Rs 2.23 crores, waste paper worth Rs 7.40 crores, jute waste Rs 2.92 crores, cotton linters Rs 3.74 crores, bagasse Rs 2.23 crores and purchased pulp Rs 72 lakhs. The quantity and value involved in the variety of wastes has created a new tempo in new areas of economic activity.

These paper mills contribute substantially to the Central and State exchequers in the form of Central excise, sales tax, etc.

Growth of paper/paper boards is one of the developmental dimensions of APIDC. It has to its credit as many as 280 large and medium industries involving an industrial investment of Rs 1,126 crores and covering a wide variety of projects like rayon grade pulp, laminated particle boards, plywoods, agro and forest-based industries, ferrous and non-rous engineering, electronic, chemical and a host of mineral-based industries.

Paper-based packaging for cost reduction

By M. R. SUBRAMANIAN

IN today's context, a package is an inseparable part of the product. Paper-based packages are thus not end products in themselves, but they form part of the product (contents) intended to be packaged. In a printed package the quality of the package is determined by how effectively it communicates the quality of the product.

A package is required to meet the critical needs—*the identified critical needs*—of the product system, of which the package itself forms part, e.g. the shape of the package has a distinct relationship with the contents and influences the marketability of the contents.

So far the technological needs of the product, *viz.* of the product composition and its physico-chemical characteristics, have been the main points for consideration. But today's successful package would have to meet the needs of the product system including package processing, storage, transportation, distribution, merchandising, etc. It must be recognised that the packer/user of the package is not necessarily aware of the role of packaging as an integral part of the product system he intends marketing. For example, while he may know that grapes are saleable in 250 gm pack of paper board in the Gulf, he is certainly not aware of all the elements involved in the effective marketing of the product in the Gulf particularly relevant to the package. While large-scale national and transnational organisations may claim to have the ability to interpret the product system needs in terms of packaging material needs, the vast majority of industry and trade in the country may have to be helped in realising the basic elements of the successful system. This is true of India as much as it is true of every developing country. The growth of paper-based packaging business depends on how effectively this is done by those concerned in the trade.

Another example may also help. The undertaking of a promotional programme of selling tea in airlines to international passengers may at once bring into focus the need for a light weight package and, therefore, paper-based packaging. The emotional needs of the consumer who would like to have their premium tea in metal or metal like containers may lead to a proper analysis of the needs, so that market may develop for the intended product through an appropriate form of packaging identified.

Likewise the gift wrapping of popular Indian sweets can easily shift from the traditional mill board system to attractive pulp board/duplex board systems, provided the packer can be familiarised with the ultimate needs and fitness for the purpose. Here the satisfaction of the emotion is a more important criterion than low cost.

Packages intended for high speed operation in an automatic line would require superior functional characteristics and qualities such as of close tolerance in dimension or of stiffness and costs will have to be related to the cost of bottlenecks in production avoided through the use of appropriate materials. Thus cost reduction concepts must first take into account the intended use and the purpose.

Specifications

The system of ordering materials by a vast majority of the industry in the country relies heavily on the material specifications. Perhaps other criteria must have been tried and abandoned. However, the continuous growth and expansion of any industry including paper packaging industry, depends upon how effectively it can meet the needs of the user. A mention has been made earlier that not all the users are familiar with the needs and, therefore, it becomes the responsibility of the suppliers of the packaging material in this case to identify the user needs—in fact, the end-use needs.

The analysis of the end-use needs would at once bring out the necessity for identifying the performance expected of the material or the package. The benefit from this analysis is discussed in the following section, but if such analysis is not carried out, there is a heavy dependence on trying to describe the material and its characteristics for purpose of purchase. In this context, there are a minimum of three important factors, which help the buyer in avoiding unwanted specifications or unfulfillable specifications. They are:

(a) The limitations of the basic raw materials in a sellers' market.

(b) Process capabilities of the source;

(c) Quality control systems of user. Quite often it is seen, that the characteristics of the converted package cannot be maintained because of large scale variations in the quality of the raw materials, particularly in a scarce situation. It is quite obvious that ultimate performance value cannot be maintained.

The process capability of manufacture varies from one unit to another, and where price is the only guiding factor for purchase by user, it stands in the way of evaluating the quality and the capability of the source. This leads to a paradoxical situation where specifications are found in the purchase order and not in the purchase. A drastic conclusion that could be drawn is that if the unobtained specifications were eliminated, a more economical purchase would have been possible.

The systems of quality control do not quite often form part of the purchase specifications. Two kinds of situation arise as a result—supplies not meeting the specification are accepted or supplies meeting the specifications are rejected. It is quite possible that suppliers who are not familiar with the lacunae are unable to sustain the business. The purchase specifications for packages continue to describe only factors connected with the package. The details of contents and of the transport packaging are not indicated in the specifications.

The loser is obviously the purchaser for he does not benefit from capability of the supplier who has a knowledge of a very large cross-section of the users to provide suggestions for modifications of specifications, leading to the profitability of the users' business and of expanding markets possible with lower costs as a result. Surprisingly most suppliers do not seem to enquire into the details of the uses, with the objective of assisting the buyers in mutual interest.

It would be interesting to raise some questions:

Is grammage a necessary specification?

Is stiffness of board or stiffness of crease more important to high speed operations or pack seal failure?

Is gloss a criterion in higher value product packaging?

Mr Subramanian is acting director of Indian Institute of Packaging.

along with Waste Paper.

How relevant is the source of paper board?

How important it is to prescribe the printing process when printed result is what one needs to verify?

Is it necessary to specify a lining material or is it better to indicate the guarantee for use?

By providing an indication of the use of very strong shipping container in the purchase order is it possible to obtain a suggestion for reduction in the specification for board used in the folding carton?

Value analysis

Cost reduction is always considered to be synonymous with value analysis or value engineering. This understanding, rather misunderstanding, has been responsible for reduction in cost at the cost of quality. An objective approach would be to enhance the value of a product system by (a) enhancing the quality and maintaining cost (b) enhancing quality at marginal additional cost (c) reducing the cost and maintaining quality.

The worth of the product is always determined by asking questions with regard to the functions the product performs. This can be equally applied to the functions of the package. It is desirable to raise the question connected with the product as well as the package in order to arrive at the sum total quality. Examples can be easily found in cosmetics, gifts, consumer durables, etc though this analysis is applicable to the entire gamut of packaged product. The question usually asked to begin with are: (a) What does it do? (b) What else can do the job?

In order to attempt answers to these seemingly simple questions, the packer is required to be armed with a whole lot of information. The more specific the information, the greater the chances of economic alternatives. If an exercise of the nature is undertaken, it would lead to a proper assessment of the use needs and the package performance needs. For example, when the need for printing on cartons containing shrimp was discussed in the United States, it was revealed that an improved presentation could lead to an increase in the per unit price about which the user in India was unaware. Thus, the potential for improved, rather higher cost packages was discovered by analysis of this nature even though the general belief in the industry would be that the maintenance of low cost was the only criterion in a competitive situation.

The relevant questions which may be asked in exploring potential for value improvement would include:

(i) can the functions required to be performed in a metal or glass container be performable by a paper board, or lined carton or composite container system? *e.g.* tooth powder, edible oil.

(ii) can plastic laminated printed boards offer a premium brand of a product or raise its status *e.g.* ready to wear garments.

Packaging developments

Of interest to the paper-based packaging producer are the changes that are taking place in the direction of (a) improvement in conjunction with plastics (b) shift away from paper to plastics and (c) demands of export packaging.

In the category (a), some of the recent trends in India are:

(i) *Cold lamination*: The imported as well as the locally available cold laminating facility using plastic films, notably, polypropylene, PVC and polyester are helping in the improved eye appeal of packages. Paper board of poor quality can be upgraded when printed and thus laminated. The sophistication in demand in some areas for

---

From agricultural waste to paper

RECENT research on the possibility of utilising farm waste for the manufacture of paper and allied products has borne fruit at the Tamil Nadu Agricultural University.

The college of Agricultural Engineering, affiliated to the University, undertook this research activity as far back as 1976. An inter-disciplinary approach which co-ordinated efforts of various departments such as agricultural chemistry, farm machinery, and farm processing resulted in farm waste being screened for pulp manufacture. The pulp extracted has been found useful for the production of various types of cardboards, paper boards, wrapper papers, brown and white paper, etc. The researchers, headed by Prof R. K. Sivanappan, the dean, however, do not claim to produce high quality writing paper. In fact, their objective is to economically utilise farm waste, keeping production costs as low as possible in order to make the end product competitive.

After screening a variety of raw materials, attempts were made to produce paper, cardboards files and particle boards. Different combinations of rag materials and waste paper with agricultural wastes offered scope to produce papers, envelopes, cardboards and office files, which have a good market. Since hosiery cuttings and rags impose constraints on the cost of production, the second phase of raw material study was concentrated on the different combination of waste paper and agricultural wastes.

Their qualities have been compared with the conventional products available in the market with reference to the strength, durability and finishing characteristics.

The study has shown that following raw materials could be used for extracting paper pulp. Jawar chaff (not useful as feed for cattle), cotton stalk (not decomposed easily), maize cobs after removal of the grains, sunflower stalk (difficult to decompose with hard fibrous components), mature bajra stalk (thrown off as waste), banana pseudostem and sheath (with valuable fibre but not used in industry), Okhra bhendi stalk (over matured ones), papaya stem thrown away as waste, Glyricidia pods available in plant after green manure salvage, mature napier grass not used as cattle feed, lantana weeds (noxious thorny plant difficult to eradicate), mesta (defibred) stem, and prosopis juliuora (noxious thorny weed).

Cost factor

One paper pulp plant to utilise the farm waste could be set up at a cost of Rs 2 lakhs, covering the cost of building and machinery. The raw material could be obtained for running the plant all the year round from a farm land of about 500 hectares, depending upon the crops cultivated. If it were banana, cotton and jowar area, enough waste material could be obtained all the year to run the plant. One of the major inputs being water, one must assure adequate water supply all the year round. One unit could employ about 20 persons when worked for eight hours per day. The net return from the investment would, however, depend upon the efficiency of the management.

cartons points to a potential for growth of this application.

(ii) *Lamination with metallised films*: The availability of metallised plastics and their use in certain areas have promoted the lamination of metallised plastic films to paper board with printing techniques being able to offer proper surface decoration facilities. This area offers promise.

(iii) High gloss coated paper boards have taken over the sophisticated markets notably in the garment trade. There is potential for intensification of effort to widen the sphere.

(iv) The use of polyethylene coated folding board cartons with the change in the sealing systems, compared to conventional systems, have captured food packaging markets abroad. The flame sealing technique can help expand markets for paper packaging.

(v) The promise of indigenous availability of PVDC should motivate suppliers to begin experiments on the use of coated boards. Whether for water-proof applications or high gloss application or food contact applications PVDC coated paper and boards would be found to be useful.

(vi) So far the country has only witnessed the lined carton systems, but indications are that the coated carton systems will appear on the Indian scene to pack dairy products, oils, etc.

(vii) The tetra-pak system is already being discussed. The use of lined or coated cartons for granular and liquid food products can be conveniently promoted provided large scale investment is made in R&D.

(a) The movement away from paper based packaging should also interest suppliers of paper based packaging materials in order to help plan a strategy for growth. The use of plastic bags for laundry, shrink packaging for unitisation etc as a step away from paper board cartons and similar shifts will have to be taken cognizance of.

(b) There is certain shift taking place in the composition of our exports. There is movement towards consumer packages in selected areas. The exporters would have to be helped with improved packages if they have to compete effectively and stay in the markets. They should be enabled to obtain better value for money, in order that they in turn can enhance their export earnings.

Conclusion

It may be stated that as packaging in India is still in its infancy, there is room to expand every sector. Paper packaging is no exception. Creative efforts in the areas of (a) improved functional design, (b) user education on end use needs, (c) making greater use of modern materials to offer new combinations which are cost effective, and (d) promoting the concept of better value are the need of the hour.

COMMERCE

(Established 1910)

An authoritative source of facts, figures and comments on India's industry, agriculture, trade, banking, commodities and the economy as a whole, with an appropriate focus on international affairs.

All the facets of current development in the Indian economy are continuously and closely studied by the staff of the **Commerce Research Bureau** on the basis of the latest available primary data. The results of these studies are made available to the wider public through the pages of **Commerce**.

This makes **Commerce** an invaluable source of authentic information for colleges, universities and everyone concerned with the academic world.

Special Reports

New vaccines against poultry diseases

By OUR SPECIAL CORRESPONDENT

PUNE

THANKS to the efforts made by the Bharatiya Agro-Industries Foundation (BAIF), large-scale deaths of poultry birds due to Marek's disease is likely to become a phenomenon of the past. For, the BAIF Research Institute of Animal Health (BRIAH) has recently developed new vaccines which would be used to protect poultry birds from several deadly diseases.

The poultry vaccines are at present imported into the country. The BRIAH took up the challenge of producing the vaccines indigenously with an accent on developing also the technology indigenously while at the same time maintaining high quality. The technology of poultry vaccines is a secret closely guarded by companies of the developed countries. It is very heartening to know that the BRIAH has succeeded in producing these voccines through indigenously developed technology.

The BAIF scientists working at BRIAH laboratories, Wagholi, ten kilometres from Pune, have also produced new generation animal vaccines against some of the important bacterial and viral diseases. The manufacturing technique of these vaccines is a major departure from the crude methodology hitherto practised at various centres of the country. The BAIF technology makes use of a specially developed media permitting large-scale batch cultures in three dimensional phase and the sophisticated biochemical concentration, deep freezing and freeze drying procedures, which not only improves the quality of the vaccines but also has an added advantage of reducing considerably the dosage regimen, thus resulting in savings on account of packing, transport and administration. The new generation animal vaccines developed by the BAIF are directed against diseases like rinderpest, haemorrhagic septicaemia, and black-quarter of cattle and new castle (Ranikhet) disease of poultry birds. Besides, the BAIF has also recently developed Aluminium Hydroxide Gel (AHG) which too is presently being imported.

The BAIF is also making research and development efforts to develop vaccines for other diseases relating to the cattle, buffaloes, sheep and poultry. As a result of these efforts, it succeeded in developing vaccines for foot and mouth disease of the cattle. The new techniques developed by BAIF of concentration of antigens are expected to permit blending of multiple vaccines which eventually would lead to an era of "single dose innoculation for multi-disease protection".

Dr D. S. Gorhe, Chief Executive, BAIF, said that the BAIF had come into existence in 1967 with a view to providing gainful self-employment to the rural poor through conversion of low-productive rural liabilities into productive assets. This is being done through the rural development programme of the BAIF for which purpose it has set up four main divisions: integrated rural development; central research station for cattle and agriculture; water resources development and management; and animal health.

India has the largest cattle population in the world (186 million) and one of the lowest milk yields (about 350 litres per lactation). BAIF is using this mass of nondescript cows as seed-bed for producing a new generation of cross-bred cattle. A cross-bred cow born out of BAIF's programme yields over 2,500 litres of milk per lactation. A cross-bred bull born out of BAIF's programme

is proving a good draft animal in terms of tonnage that it can carry and haul.

As at the end of 1980, BAIF was carrying on this cattle breeding programme through 370 cattle breeding centres in the states of Maharashtra, Rajasthan, Gujarat, Karnataka and Uttar Pradesh. These centres are manned by trained veterinary graduates, who reach out to about 3,50,000 rural families in about 7,000 villages. The BAIF is entrusted the task of achieving one million cows conception through 500 cattle breeding centres. So far BAIF has registered nearly 1,30,000 conceptions and over 50,000 cross-bred female cows have been reported born. BAIF uses artificial insemination technology, using frozen semen of high quality selected bulls, which are also undergoing progeny testing. A very important feature of the BAIF cattle breeding activity is that the farmer's cow is inseminated at the farmer's door.

BAIF has established its central research station at Uruli Kanchan in Maharashtra where all necessary infrastructure is available to produce, process and supply the necessary critical inputs. Some of the important facilities erected at the central research station are cattle breeding farm, frozen semen bank, research laboratories, fodder and forrage development, and a training institute.

The activities of the BAIF are carried out by a staff of over 600, comprising specialists in different areas of animal health, agriculture, general science, engineering, management and finance. This multidisciplinary nature of the staff helps the BAIF to adopt a professional approach in its activities. The BAIF has so far invested about Rs 6 crores in its projects, financed by the Union Government, various state governments, Government of Denmark and France as also several Indian research agencies and industrial houses.

New package for rural industries

By A SPECIAL CORRESPONDENT

IT was with great fanfare that a new Industrial Policy Resolution was sought to be publicised in July last year. What has been its impact on taking industry to promising rural areas? Hardly say any, if we were to make any sense of Dr Chanana's announcement that Government will now start a new programme in 101 districts, selected for special concessions on account of their backwardness. The new deal seeks to attract industrial investment to these areas with a subsidy at the rate of 15 per cent of the fixed capital costs on land factory buildings and plant and machinery. The investment subsidy will be given as an outright grant. This step will be particularly welcome in the northern and north-eastern areas and in the far-off island territories.

But recourse to such piecemeal steps suggest that Dr Chanana has yet to arrive at Government's considered formulation of industrial policy for rural development. Last year's measures have obviously done little to correct regional imbalances, to disperse industry to generate new rural incomes and therefore were less to relieve rural deprivation and to reduce exodus from villages to urban centres. If there had been some success with Dr Chanana's policy, Mr A. R. Antulay, Maharashtra's Chief Minister, would not think of work permits for migrants to Bombay. With few new jobs being created in old Bombay, the work permit—like the cement permit—will become another means of extending patronage, undermining political opposition and enabling political friends to make some more illegal and unaccountable money.

Dr Chanana's new measure is said to be an outright grant of Rs 15 lakhs at the maximum for an industrial unit. Whether or not it proves to be sufficiently attractive remains to be seen. Its impact will be hard to assess. It will also have to be seen against the background of existing incentives. An important and connected measure has seen a subsidy of 50 per cent of the transport costs when raw materials and finished goods are moved to and from certain rail heads and parts. In 246 selected backward areas and districts, new entrepreneurs already enjoy other fiscal aids and subsidies. As between neighbouring states, moreover, there has sometimes been a beggar-my-neighbour spate of additional benefits. The sum total of such tax concessions, time-bound exemptions and financial and fiscal incentives needs to be assessed for both their effectiveness in furthering declared policy and for the burdens on the honest taxpayers. The working of state industrial corporations—most of them now short of funds—is a proof enough that more is needed than a package of the most attractive incentives.

A useful step has been the shelf of project reports on industries best suited to the varied resource endownments of different regions. What is still lacking is a concert of efforts to take industry to rural areas. Much more remains to be done to link the upgrading of the skills of local labour with the development of rural infrastructure. New ways of generating rural incomes have to go hand in hand with functional literacy and social education, so that the demand for goods and services of illegal distillers and bottleggers is not the only one to go up.

To create rural employment of the right kind will for many years continue to present varied and serious difficulties because rural poverty in its economic, social and human dimensions is wider than can be identified by a list of basic minimum needs. Incentives for rural industrialisation apart, Government must look at the policies in the round. Does a spate of piecemeal concessions create uncertainty and make the entrepreneurs hold their hands while waiting for more benefits? Do they increase the area of bureaucratic discretion and add to delays? Are there other developments, like a breakdown of law and order which make even the existing and hitherto successful industrial growth centres a dangerous place to live in? Whether it is a post office, telephones or medical relief, common facilities are slow in coming. There also is great need to encourage private enterprise in welfare programmes it is well disposed to finance. There is no reason why it should not help establish good educational and sports institutions. There is urgent need to extend tax concessions to charitable and other organisations venturing into backward areas with industrial potential in order to set up playgrounds and gymnasia, creches and day-care centres dispensaries and hospitals. While Government still learns from its experience with varying packages of incentives for dispersed and rural industries, it must show imagination in enlisting the support of private charity and voluntary leadership in public welfare.

SPONGE IRON

Is DR process the answer?

BOMBAY

INDIA appears to be catching the eye of foreign suppliers of the technology of producing sponge iron in a big way. The foreign interest stems from the fact that already a sponge iron plant with a capacity of 30,000 tonnes a year, built with West German know-how has been functioning successfully for some time past at Kothagudem in Andhra Pradesh and its trial production has been found to be quite satisfactory by a few mini steel plants which were supplied with this raw material as an additional input for their arc furnaces. Sponge iron is gradually coming into its own as the prices of ferrous melting scraps, the principal raw material for mini steel plants, continue to soar and even the available supplies are not reported to be of graded quality. This is why selected imports of scraps as well as sponge iron, the latter especially from Indonesia, have been permitted. At the same time a number of sponge iron projects are on the cards in Orissa and elsewhere.

The Government of India has reportedly decided upon a major shift in its steel policy and encourage setting up of sponge iron plants, if necessary with foreign technical collaboration. It has also liberalised rules regarding establishment of mini steel plants. All this points to growing demand for sponge iron in future by mini steel plants and thus there are seen good prospects for setting up a chain of sponge iron plants in the country. An Italian firm, Danielli, is already reported to have approached the Government to set up a 20,000 tonne capacity sponge iron plant.

The overseas holders of the technology for producing sponge iron appear to have got wind of the Government's thinking well in advance. At least Davy McKee (Minerals and Metals) Ltd of the UK, which has an exclusive arrangement with Direct Reduction Corporation of the US to engineer and contract direct reduction plants based on DRC technology, chose its time well in organising a series of seminars between July 20 and 29 aimed at selling this technology to interested Indian parties.

The DRC technology is based mainly on coal as principal reductant for converting iron ore into metallic iron or sponge iron at elevated temperatures in a rotary kiln. Iron ore in

---

As I see it

The new inequality of states

THE uneven development of the various regions of the country is a well-known fact which requires no elaboration. However, the character of this unevenness has been undergoing a change and this fact is far from well-known or understood. The unevenness in development during the British period was due almost entirely to accidental factors. The regions where the British had settled—Calcutta, Bombay and Madras—became developed. The element of policy in this development was minimal. Development was not sought as an objective of deliberate policy. It was more the result of meeting the current needs of the rulers than the effort to improve the conditions of life of the people.

Development now is a function of deliberate policy of the Central Government in New Delhi, which wields also the authority in this respect. Industrialisation is an important means of development. But economic policy, which decides industrialisation, is now heavily dependent on the will of the powers that be in New Delhi. Even such a decision whether the Government of Maharashtra can continue with the monopoly cotton procurement scheme, which has been in operation for nearly a decade, or whether the Government of Gujarat can introduce such a scheme of monopoly cotton procurement is no longer left to the state governments to be taken but are subject to the veto of the bureaucracy in New Delhi.

Mr Jyoti Basu, the Chief Minister of West Bengal, recently gave vent to the frustration of the state governments by asking the Prime Minister, Mrs Indira Gandhi if it was the objective of the Central Government to deny all avenues of development to West Bengal and convert the State into an industrial desert. The background to this complaint was provided by the objection of a so-called experts' committee appointed by the Central Government against setting up an electronics industry centre in West Bengal—on the ground, of all reasons, that West Bengal being a border State cannot be allowed to set up any important industrial centre. The Government of West Bengal's proposal for setting up a unit of Bharat Electronics Ltd in West Bengal had thus been put into cold storage. Mr Basu pointed out that not a single modern industrial complex had been allowed to come up in West Bengal, which was still in the straitjacket of the industrial framework set up by the British. The Government's proposal for the electronics complex was intended to facilitate the economic regeneration of the State, which had fallen so low that the per capita annual consumption of electricity (113 kwh in 1979-80) in West Bengal, which was at one time the premier industrial state, had fallen below the all-India average (134 kwh in 1979-80).

The absurdity of the "border state" argument is self-evident. Many states of the Indian Union are border states and not in the eastern region alone. Punjab, Gujarat, Jammu and Kashmir and Rajasthan have contiguous boundary with Pakistan and Maharashtra, Haryana, Madhya Pradesh and even Delhi are not far away. Uttar Pradesh and Bihar have got boundaries extending up to Nepal; Bihar has got a boundary with Bangladesh as well. Jammu and Kashmir, Himachal Pradesh and Uttar Pradesh have got boundaries with China. Tamil Nadu is very near to Sri Lanka and so on. The argument is raised not because of any intrinsic soundness but just to spite the State Government's efforts.

This is the new element in the inequality of the states. It is this policy that has created disaffection among a large number of people in Assam, Manipur, Nagaland, Tripura, Mizoram and elsewhere.

Subhash Chandra Sarker

BUSINESS OPINION

MR S. Moolgaokar, chairman, The Tata Engineering and Locomotive Company Ltd: "After-sales service obviously cannot compensate for the inadequacy of the roads in our country. I am afraid we may soon have to face the grim situation of a vast sub-continent which has choked its economic arteries. Stagnation in road building is not surprising, considering the meagre outlays that are being earmarked for it.

"The Sixth Five-Year Plan (1980-85) provides only Rs 660 crores for national highways — a mere 0.7 per cent of the total Central and State outlay. Compared with 1.3 per cent originally proposed in the Fifth Plan and a little over two per cent in the Fourth Plan, the trend is obvious. What is worse, several projects from the previous plan periods have yet to be completed and 38 per cent of the meagre Sixth Plan provision is earmarked for them.

"Building a total road system for the country, with roads suitably designed and maintained for the traffic they have to bear, would lead to substantial savings in fuel consumption, quite apart from the employment which is bound to be generated.

"International experts wonder at the persistence with which India disregards the world-wide trend towards upgrading highways to carry heavier (and hence more fuel-efficient) vehicles. The need for inland transport is increasing so fast that, however, efficient the railways become, our country will face a shortage of transport capacity. Step-motherly treatment cannot curb the growth of road transport but it can have a major impact on its efficiency. Considering oil prices today, no country can say it is too poor to afford good roads. The vastness of India only makes the argument more telling in our context.

"Having mentioned fuel savings, I must reiterate another issue which I have raised year after year as being a prime means of achieving this saving. I am referring, of course, to the abolition of octroi. After years of discussion, it has been recommended at the national level to abolish octroi but the recommendation has yet to be implemented in all the states. Every month by which we delay the implementation means crores of rupees worth of diesel (mainly paid for in precious foreign exchange) being burnt up, while vehicles wait endlessly at the pernicious octroi posts which dot our country."

COMMENTING on the recent decision of the Government to sharply raise prices of basic inputs like petrol, diesel, kerosene, fertilisers, etc, Mr C. I. Gandhi, senior vice-president, Bharat Chamber of Commerce, Calcutta, says : "The steep hike in prices of petrol, diesel, kerosene, cooking gas and fertilisers has come at a time when the Government has been seriously busy in tackling the problem of escalation in costs and prices and mitigating consequential hardships to the public. Needless to mention that the steep rise in the prices of petroleum and petroleum products as well as fertilisers will have their obvious cascading effects on costs and prices adversely affecting quite a wide range of essential commodities and provide further fillip to upswing in prices to complicate the current economic situation.

"Already these items have suffered successive price rises making them pretty costly. In the face of continuing bottleneck in rail transportation the hike in mineral oil prices will not only inflate the cost of road transport but would also enhance the fuel cost in several important industries. The upward revisions in prices of fertilisers in quick succession would not only inflate the cost of cultivation as well as retard wider application of scientific inputs but would also reinforce the demand for further upward revision in prices of agricultural products to the serious detriment of agro-based industries. In view of the far-reaching deleterious consequences indicated above, the reported rise in cost of oil exploration and development should have been taken care of otherwise to avert the cumulative effects of further upward revision in prices of these highly sensitive items."

natural lump or oxide pellet form and sized to between –25 mm and +5 mm, is fed to the kiln along with appropriate quantities of coal and limestone or dolomite. DRC, which operates a permanent pilot plant of 50,000 tonnes annual capacity at Rockwood in Tennessee (USA), says a single kiln direct reduction plant can be designed for as little as 50,000 tonnes per year output, but designs and layouts could be made available for capacities in excess of 500,000 tonnes a year too.

Dr J. A. Kennelley, president of Direct Reduction Corporation, has visualised bright prospects for his company's technology in India especially as this country has limitations in respect of availability of ferrous scraps, natural gas for sponge iron production, and high quality coking coal for blast furnace route of steelmaking. On the other hand direct reduction process allows use of non-coking coals of which India has abundant reserves.

Dr Kennelley was optimistic of India taking a big leap in sponge iron manufacture and that is why his company was keen on expanding its markets in this country. According to him, it was immaterial whether the sponge iron plants in India came up in public sector or private sector, because DRC would allow prospective Indian entrepreneurs to use the process as licensee of DRC. It will work closely with the entrepreneur to ensure that the plant is designed, engineered and constructed properly. DRC will also work with a construction engineering company of the entrepreneur's choice and provide process and engineering flow sheets as also certain key items of the plant itself.

Tea auctions in Singapore

CALCUTTA

FOR historical as well as economic reasons London has been the prime, rather the only international centre for tea auctions and no attempt to set up a second world tea auction centre in any way comparable to London had so far been made. But of late there have been reports that a London broking firm Gow White has plans to establish an auction centre in Singapore in association with Calcutta-based tea broking firm of J. Thomas and Co, the leading tea auctioneers in India. While a report in the *Asian Wall Street Journal* of July 21 says that these two have decided to start auctioning from October next, the Calcutta firm would not confirm the opening time and would only say that plans are still tentative.

There woud be many hurdles before the auction could start. First of all London's resources as an auction centre are by no means fully stretched and all the major and minor producing countries excepting Indonesia and China are sending direct consignments to that centre for the sale of their teas. India in particular has steadily raised the quantity of its consignments from 38.19 million kg in 1975 to over 60 million kg during the past year. It is by no means certain that Indian producers would be keen to send their teas to Singapore especially when their own expanding internal market is cutting into the export surplus.

The promoters must be banking on Indonesia and China as their supply sources, especially China which has been producing tea in increasing quantities and has exported during the past year nearly 100 million kg Indonesia, too, has increased its tea output from some 48 million kg to over 80 million kg over the next 20 years, nearly 65 per cent of which she has to sell abroad a fair proportion of exports through private sales.

Singapore has emerged as a re-export centre not only to the neighbouring Asian countries including Pakistan but also to New Zealand, Japan, the United States, Australia and even West Asia. This explains the growing operations of the world's tea multinational trading companies such as Brooke Bond and Lipton in Singapore. These companies moved into the island country only in the mid-50s but the growth in the volume of their business has been phenomenal, partly because of the easy shipping facilities and Singapore's geographical location in the middle of so many major tea producing nations. It would

help their operations further if an auction centre is also located in that country. But it will all depend on, firstly, whether and how many of the producing nations are willing to ship their teas to Singapore, possibly at some extra cost for speedy shipments, and how soon infrastructural facilities for storing tea for auctions can be got ready. The main calculation behind the plan appears to be based on the two facts : First, foreign tea buyers are finding it increasingly difficult to get their tea from producing countries, especially India, because of port and shipping difficulties and, secondly, Indian teas are facing increasing competition in London from the African producers. It would be nearer and more convenient to participate in Singapore auctions.

Be that as it may the Indian partners of Gow White are not very forthcoming on the date, the frequency and the expected volume of offerings at the proposed auction centre since the plans are still "tentative". The report in the *Asian Wall Street Journal* has it that the auctions will start from October next and there will be fortnightly auctions to begin with. Gow White and J. Thomas would not form a single company but would keep their identities by maintaining their own respective establishments. The cost of holding the auctions would be shared between the two. Whether in fact such definite arrangements have been reached between these two broker firms will be clear in a few weeks' time for a time bound plan of this nature cannot be kept concealed for long.

Jute promotion campaign

NEW YORK

OUTBID during the last decade by man-made synthetic in the burgeoning carpet backing industry, the natural fibre jute, the traditional, resilient raw material for carpet manufacturers, is bouncing back to regain its pre-eminence in the Western market.

"Jute is more of a quality product", says a major European carpet manufacturer using jute. "It gives us confidence, because there are no technical problems working with jute."

In order to boost the consumers' confidence in the inherent qualities of jute, the United Nations Development Programme (UNDP) has launched a special $ 500,000 project designed to educate the end-users in North America.

The two-year project is to be implemented by the United Nations Conference on Trade and Development (UNCTAD) through its focal point for trade promotion activities, the International Trade Centre (ITC).

The jute promotion campaign in North America, is to be carried out by ITC in conjunction with the Jute Carpet Backing Council (JCBC), a New York-based trade association comprising North American importers of jute carpet backing.

Jute is of crucial importance to the economies of Bangladesh and India and of significant importance to Nepal and Thailand. In India, for example, more than six million families derive their livelihood from jute cultivation, marketing, industry or ancillary activities. In Bangladesh, where some 45 per cent of the country's labour force is engaged in jute production, jute and jute goods exports account for nearly 55 per cent of the country's export earnings.

The jute promotion campaign is part of a comprehensive ITC jute market development programme that includes similar efforts covering hessian goods and jute carpet backing in Western Europe and jute woolpacks in Australia.

The drive to re-enlist carpet manufacturers as end-users of jute began in Western Europe in January with a $ 1.3 million campaign, funded by the Netherlands, Belgium, Switzerland and the European Economic Community (EEC).

The United States represents the largest single export market for jute, with carpet backing imports from India and Bangladesh alone amounting to $ 100 million in 1979. However, the share of jute in the market for tufted carpet backing has declined in recent years.

In the past few months, there have been indications of an upturn in jute consumption in the United States, primarily because jute prices have become increasingly competitive with synthetics. The ITC campaign aims to accelerate this process by emphasising the price advantage and quality benefits of jute carpet backing. "We believe that demand stimulation of a product is as important as supply management," says O. P. Mathur, Co-ordinator, Office for Special Commodities Projects of ITC.

After two decades of continuous expansion, world jute consumption began to level off in the early 1970s, causing supply and trade disruptions. The Bangladesh Liberation War in 1971 and the subsequent Indo-Pakistan border conflict resulted in soaring prices of raw jute and jute goods and severe market losses for the commodity in all major use areas. Jute consumption declined by about 35 per cent in the early 70s, but managed to retain about 40 per cent of the market during 1975-78.

Through much of the 1970s, jute secondary backing retailed for about 50 cents per linear yard, compared with 70 cents for foams and 55-57 cents for synthetics. Since 1976. prices have risen, and jute currently sells on a par with synthetics for 70 cents per linear yard. But the ever-escalating prices of crude oil, resulting in the continuous rise in prices of synthetics, will make jute increasingly more attractive to carpet manufacturers.

Improvements in the competitive position of jute products, resulting from rising crude oil prices are, going to be felt over the long-term. A recent Food and Agriculture Organisation (FAO) report is optimistic about the jute industry outlook not only because of the rising costs of synthetic raw materials, but also as a result of general upward pressures on overall costs of synthetics production, including utilities charges, operating costs and overhead expenses.

Propylene, a major synthetic and the base chemical for polypropylene polymer, is one of a number of by-products obtained from crude oil. It is a major competitor of jute in carpet backing. Jute also came under severe competitive pressure from substitutes such as polypropylene and polyethylene that were particularly popular in Western Europe.

Jute producing countries emphasise jute's qualitative edge over the synthetics, such as its thickness, which is viewed as a distinct advantage in primary carpet backing by the consumer. For the consumer, thickness of jute, the ITC official points out, means greater resilience and getting more carpet for the dollar. Jute's strength prevents pile fibres from rupturing or breaking at their bases under huge furniture and big cabinets. The mobility of furniture with wheels on a well glued down jute-backed carpet is the best contract carpet.

In the market for secondary backing, where the supporting material is designed to increase the carpet's dimensional stability and improve its handling, jute's mesh weave and fibrous composition make it simpler for the carpet manufactured to glue down large areas of carpet, especially in the contract market.

World recession hits Indian leather exports

MADRAS

WORLDWIDE recession due to hike in oil prices and rise in interest charges have resulted in considerable reduction in the offtake of leather by manufacturers of leather goods in the developed countries, which are the main consumers of Indian leather. Use of leather goods and footwear has fallen appreciably in the European markets.

The overall leather exports from India during 1980-81 were Rs 330 crores which was 22 per cent less than Rs 425 crores in the previous year. Despite this fall in leather exports export of leather products registered a rise of 24 per cent from Rs 69.49 crores to Rs 85.90 crores. Leather exports during April-June 1981 amounted to Rs 23.60 crores as against Rs 16.98 crores during the corresponding period of the previous year, an increase of 39 per cent.

There were signs of revival during April 1981 but it was a temporary phase. The Indian leather industry now looks to the Paris fair scheduled for September 1981 with hopes of a revival during the latter part of the year. Informed opinion in India and abroad feels that the recession should not have continued for so long.

Leather industry circles here feel that there should be a definite short-term and long-term policy for leather manufacture and export, and experience had shown that frequent changes in policy had shattered the confidence of buyers and sellers. The long-term policy should be at least for five years and should include a product-mix by which the trade should be permitted to export semi-finished leather and finished leather and leather products in a certain ratio to avoid conflicts with importing countries.

Following the Government of India's policy of discouraging export of semi-finished leather and encouraging export of finished leather, about 75 per cent of leather units have switched over from semi-finished to finished leather and this sophistication in the leather industry had helped India to penetrate the erstwhile difficult markets of Europe and America. However, Indian leather exporters are now confronted with the problem of the importing countries' hostility towards the Government of India's policy of overprotection to semi-finished leather which they had been importing for over 150 years. They feel that they are now being denied access to this precious commodity. The developed countries want India to earmark at least 25 per cent of raw material (semi-finished leather) to them so that they could open up their own market for our finished leather and leather goods to the extent of 25 per cent. Such a demand, leather trade circles point out, is in keeping with the recommendation of the Seetharamiah Committee report made as early as 1973. The trade has urged the Government of India that this recommendation be immediately implemented.

The Leather Export Promotion Council is surprised that despite its recommendation to freeze the export quota at 1980-81 level, the Centre has again resorted to an annual quota cut of 10 per cent. Exporters say it was immaterial whether the quota was utilised or not since that depended on the market situation. In retaliation, the developed countries, especially the EEC countries, have started adopting countervailing measures and are raising tariff walls against Indian finished leather and leather products. It is the Government of India's policy that had invited this trouble, they say.

It is argued that the Government should reduce import duties on certain exclusive leather chemicals and accessories (which are now being taxed from 40 per cent to 250 per cent) and also reintroduce OGL for the import of machinery to accelerate leather exports.

The chairman of the Leather Export Promotion Council, Mr M. Mohammad Hashim, has represented to the Centre that the 150 per cent rise in mandatory rates as against IATA rate increase of 30 or 35 per cent on account of fuel price hike has practically eliminated the concession granted for export promotion. Charters operated by Indian carriers are not helpful to export promotion. Air India's chartered rates to European destinations were high compared to the rates from Hongkong and Singapore. As the recent hike of 5 per cent was "not reasonable", the council has requested the Government to enhance the air freight subsidy from 40 per cent to 60 per cent of freight paid. It has been calculated that air freight works out to more than 10 per cent of FOB value in the case of skins and 20 per cent in the case of bovine hides and calf skins.

It is learnt that in spite of the strong note of dissent of the chairman of the Leather Export Promotion Council who is also a member of the managing committee of the Export Inspection Agency, the Government is going ahead with the programme of bringing finished leather under the control of the Export Inspection Agency. The council has already submitted a memorandum explaining how the scheme is unsuitable to the leather industry which would be hit hard if the scheme is enforced. But the Government has already referred the matter to the Technical committee for report within two months. Since the leather trade considers this as a "life and death" issue, it has determined to fight it "tooth and nail" and the industry has no way except to launch a nationwide agitation against this "unhealthy" policy and also stop exports for a week or fortnight to draw the attention of government and the public.

Mr V. Ramamurti

MR V. Ramamurti, former Joint Editor of *Commerce*, died in Bombay on August 4 after a brief illness. He was 62. He is survived by his wife, four daughters and three sons.

Mr Ramamurti, who was a Master in Arts of the Madras University, quite early in his career was the convenor and secretary of the Tamil Nadu Agrarian Reforms Committee constituted by the late K. Kamaraj, when he was the Chief Minister of Tamil Nadu. That work gave Mr Ramamurti an insight into agrarian problems on which he wrote competently. Later he joined as assistant editor of *Eastern Economist* before switching over to *Commerce* in 1960. He was later to become the Joint Editor of *Commerce*, and subsequently moved over to Madras as chief of bureau of *Commerce*.

Mr Ramamurti was painstaking in his work and scrupulously followed all the good rules of journalism. He was a journalist of conscience. The quality of verifying a figure or statement was to stand him in good stead when he launched a fortnightly *Fact Find* which served as an index to economic and financial developments in the country.

Opportunities for joint ventures in Africa

Concluded from page 259

Paper Mill and Kikomi in Kenya gets circulated at a jet speed, the failures too spread like a wild fire. The latter's negative influence on the goodwill and image created through other overtures also needs attention. Particularly, in case of many African countries Indian leadership has a close rapport with their African counterparts and it is therefore essential that Indian industrialists' performance strengthens the political and cultural bonds, the former being the visible signs of co-operation for development.

Exporters' reputation

All this needs to be matched by the improvement in the reputation of Indian exporters. While India is one of the world's top fifteen producers of manufactured goods with its industrial and technological advance a well-accepted fact, the export performance is still hazy on account of lack of quality control and tenacity in the cultivation of foreign markets. Indian industrialists who are used to enjoying a sellers market treat foreign markets as an outcome of the spill-over effect. Allowing for a few exceptions they have therefore been slow to understand the importance of some non-economic factors such as adherence to standard quality requirements and delivery schedules, quick correspondence, after sales service etc. Most of the African countries have been subjected to a high degree of foreign penetration and the above mentioned aspects are valued most in effecting business deals in Africa. While the trends in ECDC and TCDC are growing favourable to India, and Africa, improvement in trade performance both ways is called for. At present Africa supplies India with only two per cent of its imports and there is clear scope for improvement. On the other hand only five per cent of India's exports find markets in Africa. Some of the joint ventures therefore should be expected to result in the growth of mutual trade.

Floating exhibition

A floating exhibition of engineering goods to popularise further engineering goods in Africa is now a must. Some of the regional branches of Engineering Export Promotion Council such as in Nairobi, are already doing valuable work for promotion of engineering goods exports. Though the entrenched position of multinationals in African countries is a strong deterrent to the introduction of Indian machinery and know-how, African countries have learnt through experience a definite advantage in utilising capabilities developed in India and this has added real impetus to the Indo-African ECDC and TCDC. Increasing credits provided by IDBI to African countries and India's increasing aid directly as well as through the United Nations multilateral agencies such as UNDP and UNIDO etc have now added new dimensions to Indo-African co-operation.

India has also collaborated with Economic Commission for Africa by providing a grant of Rs 5 million to the UN trust fund for African economic development to be utilised for six projects in which Indian expertise is suited to the African development. All these efforts will have to be backed by suitable changes in the investment and financial policies with a view to making them conducive for trade and enterprise abroad. Similarly, the stream of technology transfer which has sprung up from the educational and industrial achievements of Indian people will have to be taken up as an urgent task. Greater moves towards interdependence will not come by chance but will have to be developed through careful assessment of mutual needs and responsibilities.

Africa is a huge continent and any co-operation programme will have to take into consideration the diverse needs of small and big countries alike as well as the needs of newly independent countries like Zimbabwe. Assisting African countries in their economic liberation is a laudable goal and a challenging task and India with its enviable record of co-operation could be expected to perform its best.

No arms export for full employment

From PETER RINDL

VIENNA

THE Austrian example of grass roots organisations influencing and bringing pressure to bear on government policy has been lauded by French socialist youth groups. They have every reason: The Austrian Socialist Youth Organisation was responsible for mobilising public opinion against the construction of atomic power plants in the country and demanding a nationwide plebiscite on the subject. As a result of the plebiscite, which was a decisive "no" to the construction of nuclear power plants, the government had to call a halt to its construction programme in which it had already invested crores of Austrian schillings.

Another issue, in which Austrian socialist youth groups, backed by powerful labour deferations, have forced a change in government policy, is the export of Austrian tanks to Pinochet's Chile. The government halted the export of tanks to Chile, but, it diverted supplies to Argentina.

This diversion of military supplies from one dictatorship to another has caused a furore among the youth organisations. They categorically reject the government's contention that arms exports to these countries are essential for maintaining full employment in Austria. *Young Generation*, a youth magazine from Vienna, states that the export of death is no way to fight redundancy; if it is, war will result.

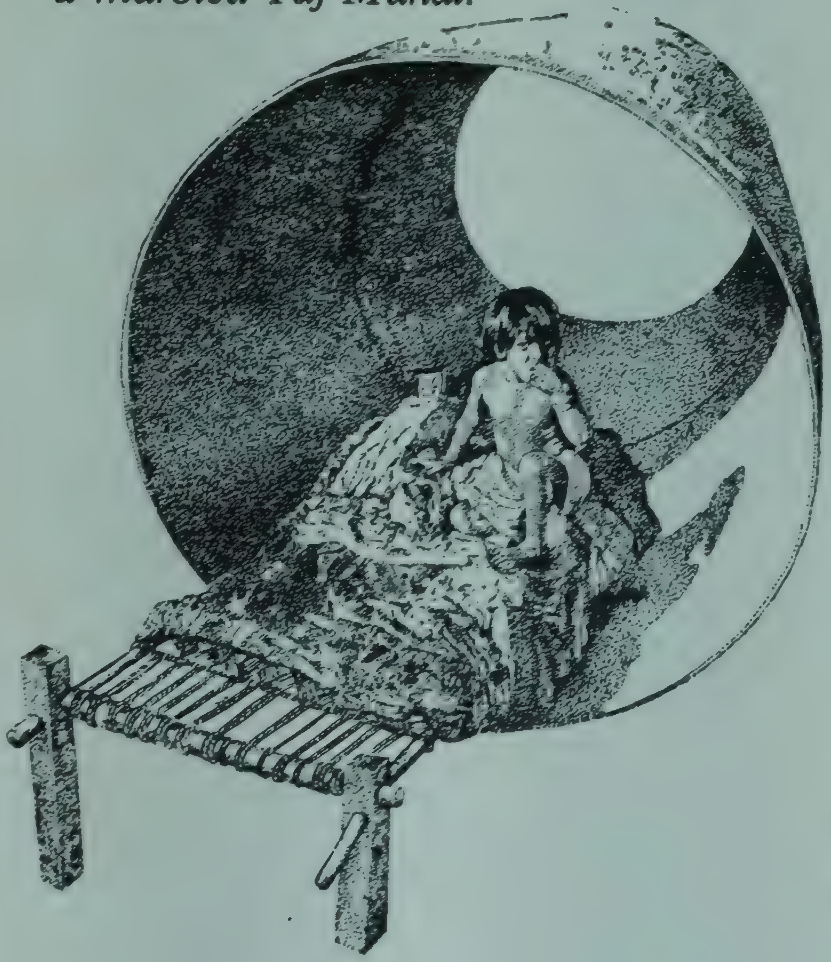
Mr Fritz Prechtl, chairman of Austria's Railwaymens Union and president of the International Transport Workers Federation has fully backed the youth organisations. He maintains that full employment must be achieved and maintained the right way. Mr Prechtl says, "those tanks will never reach their destination". Sailors on board the Greek ships ready to transports tanks to Argentine owe allegiance to the International Transport Workers Federation and are preparing for action against the transport of these tanks.

The Austrian Government would like to defuse this youth struggle by deideolising youth. But youth response to this government attempt has been negative. Youth organisations in the country believe that if they discontinue their ideological opposition to the export of arms to dictatorships in order to maintain full employment in the country, it would spell the end of democracy and the welfare state in Austria.

Austria's Minister of Interior, Mr Lanc, tried to halt youth protests on the issue by declaring that the export of tanks to Argentina was legal. Youth organisations called this declaration a "disastrous rebirth of realpolitik."

Ours is a Magnificent Land-1

I sleep in the sewers
of my homeless cities.
But I have builded
a marbled Taj Mahal.



I hunger when famine
stalks the land.
But I have saved it
from plague and pox.

I taught my child
the arts of Science.
But I have seen him
forsake my shores.

I befoul my cities
because I will not plan.
But I have looked up
and discovered Quasars.

I see food hoarded
while my poor go hungry.
But I have made the
green revolution happen.

I never taught my children
to read nor write nor count.
But I have fathered
Nobel laureates.

I see my brother outraged
by my prejudice
But I have elevated him
to the highest office.

I flee from the farms
to the despair of my cities.
But I have held to the hope
of a hundred million jobs.

I was born to subsist
on a half-Rupee daily.
But I have died so my ashes
can enrich my loved India.

I am sad.
But I am glad.
I am.

Ours is a magnificent land.
We must build a
magnificent future. Think Ahead.

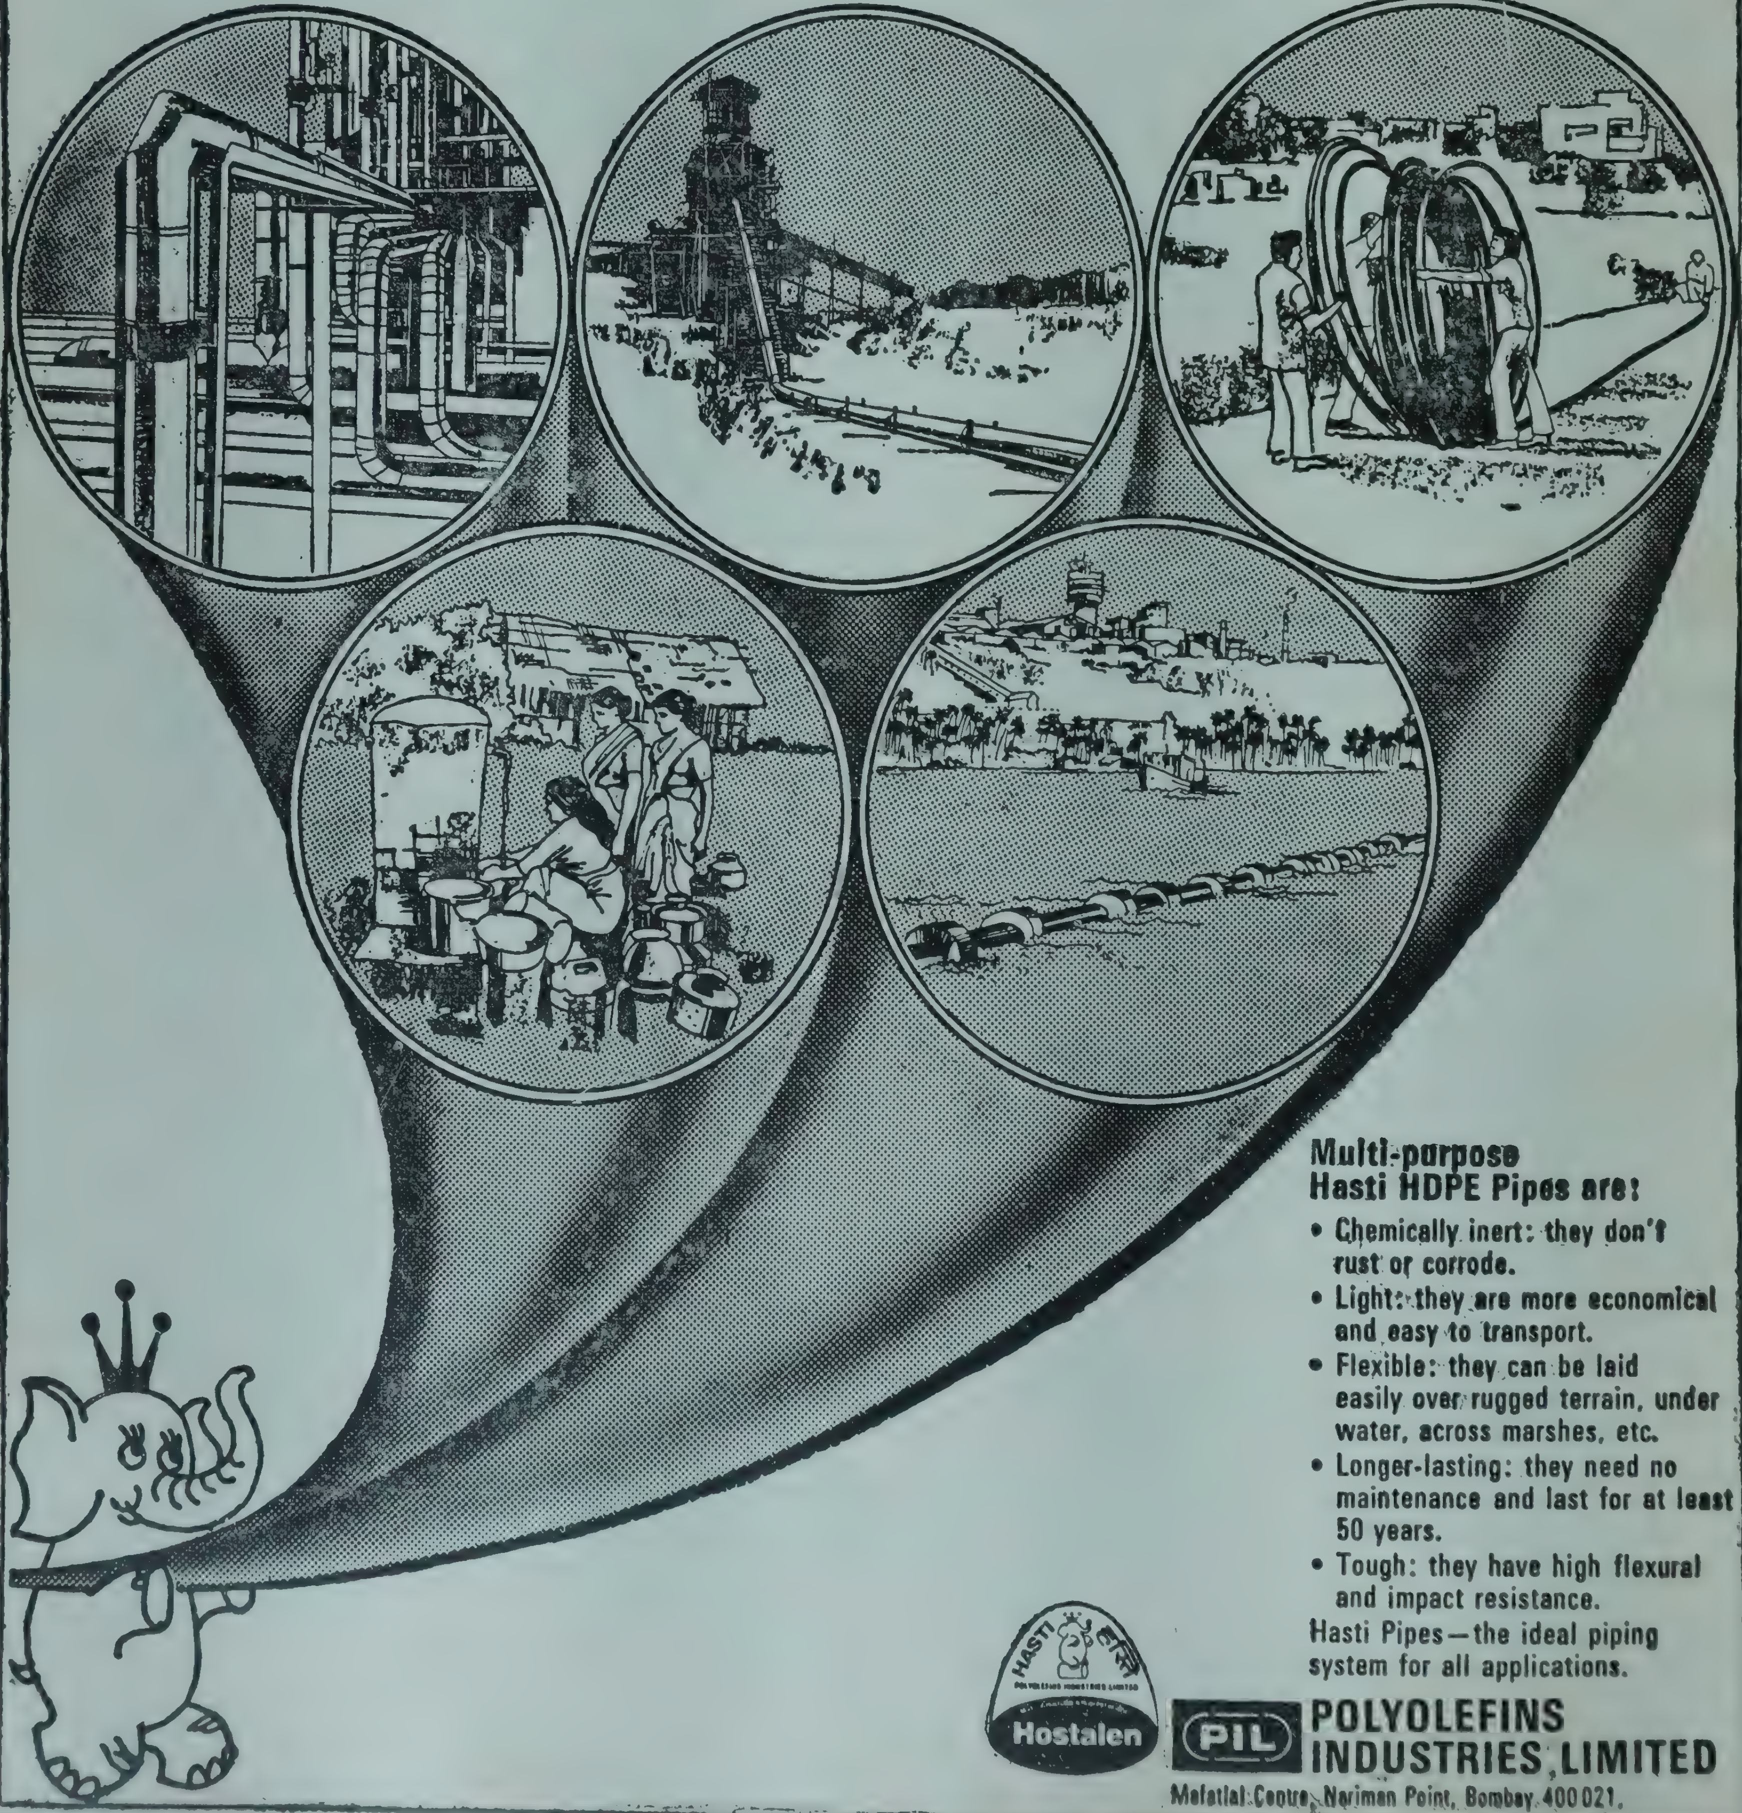
HASTI HDPE PIPES
are ideal for anything that flows.



Multi-purpose
Hasti HDPE Pipes are:

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes—the ideal piping system for all applications.

BOOKS & IDEAS

Extending South-South contact

Between Underdevelopment and Revolution: A Latin American Perspective

By Rodolfo Stavenhagen

Abhinav Publications, E-37 Hauz Khas, New Delhi-110 006, 1981, *Pages vii,* 204; *Price Rs* 75.

This is a collection of eight essays by the well-known Mexican sociologist, Rodolfo Stavenhagen, that were published earlier in different journals. The essays discuss the socio-economic-political situation in the countries of Latin America as they also deal with the character of the general assumptions and propositions put forward by writers on Latin America. As a justification for publishing these essays in India, Prof Stavenhagan draws attention to the "differences between Asia, Africa and Latin America as regards their social and economic processes" and expresses the hope that "this volume will erase some of the barriers ...to scholarly South-South exchange and to a better understanding by interested readers in Asia of the problems of Latin America."

This volume has to be welcomed from the point of view of extending South-South contact, which has been, for one reason or the other, rather tenuous—of which an example is provided by the fact that it took thirty-four years for India to conclude the first ever trade agreement with Argentina, an important Latin American country: On July 28, Mr Pranab Kumar Mukherjee, Union Minister for Commerce and Mr Carlos Garcia Martinez, Minister of Foreign Trade of Argentina, signed the three-year trade treaty. Of course, earlier India had concluded such an agreement with six other Latin American countries—Brazil, Chile, Columbia, Cuba, Guatemala and Peru.

Prof Stavenhagen points out that much of the writing on Latin America is vitiated by the propagation of wrong ideas about the character of these countries and the development therein. In this context he has selected seven fallacies that are widely prevalent in the writings on Latin America and refutes them point by point. The first fallacy is that the Latin American countries are dual societies by which it is sought to be made out that the desired capitalist transformation of society is being thwarted by the persistence of feudalism. The author seeks to show that the fact is the other way round. The underdevelopment of the economies is more the result of the way capitalism developed, creating zones of colonial metropolis exploiting the other regions in the countries of Latin America. He identifies this internal colonialism to be the dominant characteristic of the Latin American society and the root cause of their poverty and backwardness (the Indian situation bearing a strong resemblance to the situation).

The second fallacy is that progress in Latin America will come about by the spread of industrial products into the backward, archaic and traditional areas, while in fact what has often happened is nothing but an extension into the rural areas of monopolies and monopsonies with disastrous consequences for the economies and societies of the poorer countries. "The progress of the modern, urban and industrial areas of Latin America has taken place at the expense of backward, archaic and traditional zones" (p 8). The destruction of the village industries in India in the face of unequal competition from consumer goods produced by the organised industries—often owned by transnationals—provides a close parallel.

The third thesis he blasts is that the creation of a national market is thwarted by the traditional, backward and archaic rural areas and the growth of a progressive and national capitalism is impeded thereby. The fact is that no progressive or national capitalism exists in Latin America. Moreover income distribution has an important bearing on the size of the market. When in the so-called developed metropolis the market is divided between the few affluent rich and the much more numerous poor with low purchasing power, it is difficult to accept the thesis that the local capitalists are interested in the creation of a truly national market. "If the internal market were indeed the driving force of Latin America's bourgeoisie, Mexico's capitalists would not be seeking, as they are, investment opportunities in Central America, or Brazils, in Paraguay and Bolivia; they would not be exporting millions of dollars a year to the security of American and European banks; they would, instead, favour more equitable tax policies, lower profit margins and higher turnovers, lower prices for their products, and higher levels of production. Generally, however, they favour none of these things," writes Prof Stavenhagen. Do we see an Indian parallel here also?

The fourth thesis that the national bourgeoisie is interested in breaking the power and the domination of the landed oligarchy is also shown to be untenable, since in more than one Latin American country the families associated with foreign capital are also the owners of the major feudal latifundias.

The fifth erroneous thesis, according to Prof Stavenhagen, is that Latin American development is the work and creation of nationalist, progressive, enterprising and dynamic middle class and the social and economic policy objectives of the Latin American governments should be to stimulate "social mobility" and the development of the class. He starts by questioning the correctness of the definition of "middle class" as the term is a euphemism for "ruling class"—a class that has power in the society, occupies the apex of the social, economic and political pyramid and makes the overall decisions that affect these countries. Such a class is by no means a "middle" class. Moreover the stress on the so-called "middle class" often obscures the tensions, oppositions and conflicts between ethnic groups.

The sixth thesis he exposes as unsound says that national integration in Latin America—where countries have major ethnic problems arising out of the presence of people belonging to different ethnic groups like the Indians and the Negroes—is the product of miscegenation (*i.e.* ladionisation)—acculturation of the Indians in the pattern of the European colonisers. He points out that national integration is intimately bound up with the disappearance of *internal colonialism*—exploitation of the vast majority by a minority—rather than with the development of a new biocultural category.

Prof Stavenhagen rejects the seventh thesis which stipulates that progress in Latin America will only take place by means of an alliance between the workers and the peasants, as a result of the identity of interests of the two classes. Not that he denies the desirability or the possibility of such an alliance but considers it unlikely to come about in the near future because of the social configuration of *internal colonialism* as, in not a few cases, benefits obtained by the working class are usually obtained at the cost of agriculture—*i.e.* the peasants, The urban working class is very much a beneficiary of internal colonialism, which is the greatest single obstacle to economic and social development in Latin America.

The rural population in Latin America has the lowest standard of living among the population in the countries there and its income is half the national average. A study of seven Latin American countries disclosed that a small part of the agricultural population possesses or controls most of the land and other productive resources in the rural areas. Between 60 per cent and 90 per cent of agricultural population exist in conditions analogous to those of the medieval European serf, with extremely low wages and suffering from disguised unemployment. Agrarian reform is the most important task in Latin America. The intolerable rural living conditions have given rise to the phenomenon of urbanisation without industrialisation with concomitant "structural marginalisation" for a very large number of the people who are integrated into the system at the lowest level and condemned to suffering the worst domination and exploitation.

Latin American countries thus exhibit the traits of what Prof Stavenhagen calls "Dependent Development"—*i.e.* a development whose characteristics are fixed by external dependency and in which industrialisation does not reduce the country's dependence on imports (but only substitutes some imported goods for others) or the exports of raw materials and the country's economy comes to be dominated upon by the multinational corporations. He discusses in some detail the economic and political tasks ahead in the Latin American countries.

The final chapter is entitled "Decolonializing Applied Social Sciences" which is of particular interest to Indian academicians and writers. Prof Stavenhagen paraphrases Marx and says, "I hold that the most fruitful social theory is the one that may be validated not by any amount of statistical verification but by the practical day-to-day problem-solving of real-life issues." (Pp. 183-184) He goes on to ask : "Can books about peasants be brought to the attention of, discussed with and used by peasant organisations? Can studies on urban migrants be made to help labour unions and neighbourhood voluntary associations to better understand, and thus solve, their problems? Cannot studies on social movements, popular rebellions and revolutions be shorn of their scientific and scholarly paraphernalia and made available to the revolutionaries themselves? How many studies do we have of political elites and their decision-making processes; of the functioning of bureaucracies; of entrepreneurs (not only as innovators or modernisers but as political and economic interest groups); of foreign business communities in underdeveloped countries; of corruption among labour leaders; of advertising and the manipulation of ideologies, opinions, attitudes, tastes and the innermost emotions; of the role of estate owners in the maintenance of traditional agrarian society; of regional and local *cacicazgos* or *coronelismo;* of the influence of foreign diplomatic missions on national politics; of ecclesiastical hierarchies; of military cliques; of the role of the mass media; of oppressive educational systems; or simply of the varied and multiple aspects of repression (physical, cultural, psychological economic) that dominant groups use to maintain the *status quo?*"

These questions are very much relevant in the specific context of our own country as well.

Subhash Chandra Sarker

CORPORATE SECTOR

Mahindras: Substantial increase in output

In a major expansion programme with a capital cost estimated at Rs 75.78 crores, Mahindra & Mahindra Ltd (M&M) has planned to enlarge and modernise the manufacturing facilities for jeeps, light commercial vehicles and tractors, as also to update the diesel engine technology. This was announced by Mr Keshub Mahindra, chairman, at the extraordinary general meeting of the company held recently. The entire programme is expected to be completed by 1984.

Mr Mahindra stated that the installed capacity of 15,000 units per annum for jeeps and light commercial vehicles, as of 1979, will be expanded to 25,000 vehicles per annum. As part of this programme, the new plant at Nasik will cater exclusively to the assembly of light commercial vehicles, he said. Concurrently, the manufacturing capacity of tractors is also being expanded from 10,000, as of 1979, to 15,000 per annum.

The company's production has shown a substantial rise. The output of jeeps and trucks showed an increase of nearly 30 per cent to 16,574 from 12,280 in the financial year of 1980. The output of tractors increased by 22 per cent to 9,539 from 7,813.

Mr Mahindra explained that the financing for the capital cost of Rs 75.78 crores, is made up of loans aggregating to Rs 56.56 crores and internal cash generation amounting to Rs 19.22 crores. Including the interest on loans during the project period, and the additional working capital, Mr Mahindra stated further that the total project cost is estimated at Rs 110 crores.

An investment agreement has been signed, according to Mr Mahindra, with the International Finance Corporation, Washington DC, USA, for a loan of US $15 million (Rs 12.39 crores). Arrangements for loans from the all India financial institutions and banks are in an advanced stage, he elaborated. At the same time, steps are being taken to avail of project finance from the Export Credit Guarantee Department of UK, and a sales tax incentive loan from the State Industrial & Investment Corporation of Maharashtra (SICOM).

Mr Mahindra pointed out that a technical collaboration agreement has been signed with Automobiles Peugeot, France, for the progressive manufacture of the fuel efficient XDP 4.90 model of the diesel engine which will be manufactured in a plant to be set up at Igatpuri.

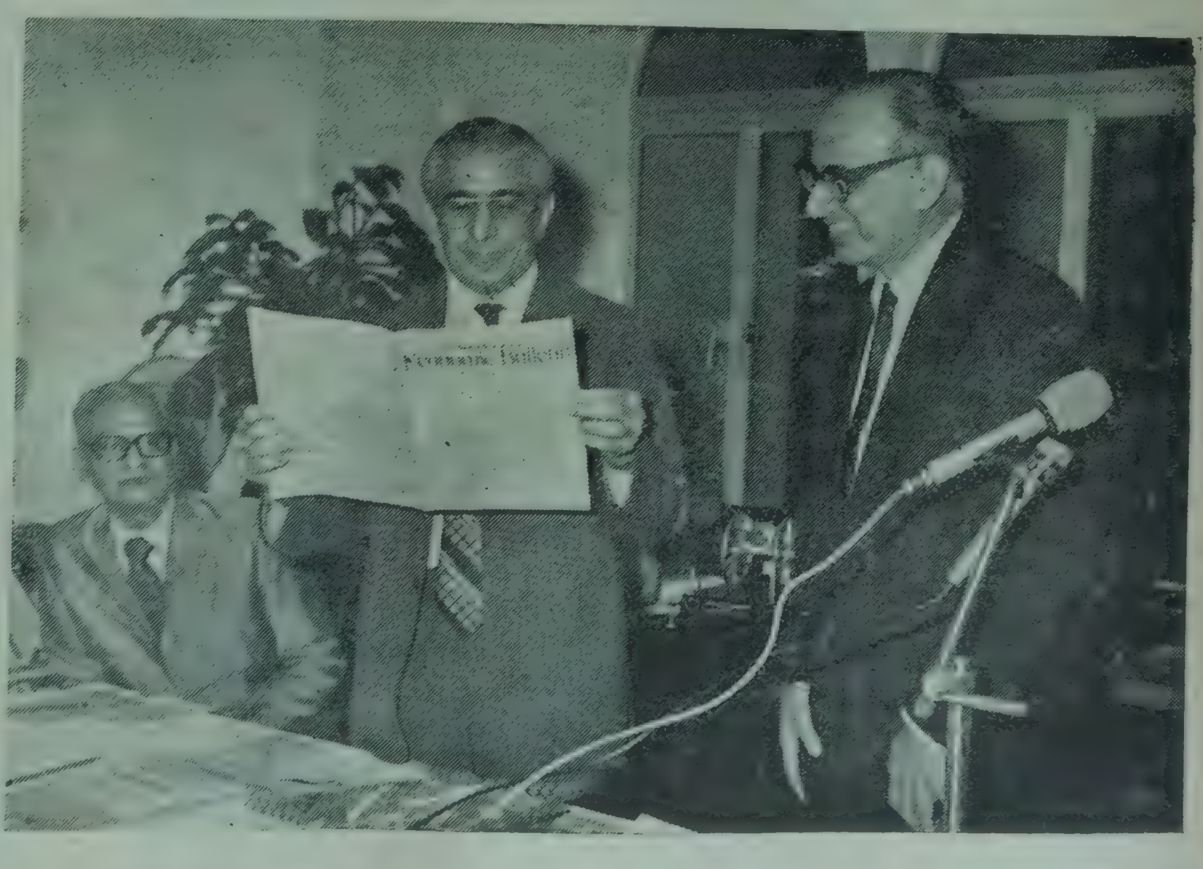
Central Bank of India's Economic Bulletin

While India's standing in the fields of agriculture, industry and technical manpower gets due recognition in economic writings, largely its achievements in the field of banking have gone unnoticed, said Dr Fredie Mehta, Director, Tata Sons Pvt Ltd. The importance of banking system in the country's economic development is growing in that it is shouldering the responsibilities which used to be a budgetary function a few years ago, he added. Dr Mehta made these remarks as the chief guest on the occasion of releasing the first issue of *Central Bank of India Bulletin* here recently. Earlier in his welcome address Mr B. V. Sonalker, chairman and managing director of the Central Bank of India, conceded that although there were a series of monthly bulletins by other banks, Central Bank had the advantage of wide network of nearly 2,000 branches and it hoped to contribute articles of topical interest.

Speaking on the occasion, Prof M. L. Dantwala welcomed the publication and said that it was necessary to educate not only the public and the depositors but also the top bank managers. In particular he urged the top executives in the banks to pay attention to the evaluation reports made by their own banks.

Edited by Dr D. P. Pandey, chief officer, economic intelligence department of Central Bank, the *Bulletin* in its first issue contains, among others, a study on 'Economists in Bank Management' by the Editor himself.



Dr F. A. Mehta, director, Tata Sons Ltd, seen releasing the first issue of Central Bank of India Economic Bulletin. On his left is Mr B. V. Sonalker, chairman and managing director of Central Bank of India. At extreme left is Mr T. M. Gopalswamy, general manager of CBI.

harp retreat

Bombay, August 3

Scared of a likely second dose of nti-inflationary measures, labour rouble at Century's Kalyan plant nd the reported dim prospects for he world shipping industry, bulls hose to unload a part of their oldings. As a result, equity prices eat a sharp retreat. Activity was estricted and the undertone at he close of the week was diffident.

During the week, the Bombay tock Exchange authorities imposed special additional deposit argins on bulls in respect of 22 crips and on bears in the case of 1 scrips to curb both excessive uying and heavy selling. The adla charges were, however, normal at about 2 per cent.

In view of the labour unrest and he threatened lock-out on August 4 at Century's Kalyan plant, eavy selling developed in the crip. The price dropped from the veek's best level of Rs 831 to lose at Rs 809—a marked loss of Rs 22. The previous closing was at Rs 816. The net loss was, however, seven points.

Standard was quoted at Rs 569 xd against Rs 597—showing a oss of six points even after taking into consideration the dividend of 22 per cent. Morarjee Mills yielded modest ground on deeper rosion in profit margins during he year ended June 1981 despite harp hike in sales.

Shipping shares bore the brunt of selling on reports that the world shipping industry has started facing rough weather after the recent bright fortunes. G. E. Shipping declined by Rs 9.75 to Rs 53.75 and Scindia by Rs 4.75 to Rs 27.

Tata Steel came in for profit-taking and the scrip declined by eight points and TELCO by seven points. ACC slumped by Rs 19 to Rs 159 on renewed offerings. Tata Oil suffered a sharp setback on marked selling pressure, because the announcement of one-for-five bonus issue fell far short of market expectations. The expectations were at least two-for-five. The price tumbled down by Rs 23 to Rs 87. PAL again encountered selling pressure and lost a further 14 points at Rs 238.

In the cash section, Indian Rayon shot up to a new peak at Rs 107 on informed buying. The high level, however, invited profit-taking and the scrip finally wound up at Rs 96, with a smart net gain of 15 points. MICO spurted by 20 points to Rs 485. Shipping shares like Dempo, Chowgule and Ratnakar yielded marked ground on burst of selling activity.

Market Gossip

Pak cotton for India

IT is good that New Delhi accepted the plea of the Indian Cotton Mills' Federation that a shortage had developed in the short- and medium-staple cottons and that imports be made of the fibre so essential to the textile industry. The Federation had sought the import of ten lakh bales of cotton, but the Government has conceded the demand only partly. Last week the Cotton Corporation of India negotiated a deal with Cotton Export Corporation of Pakistan Ltd for the purchase of one lakh bales of medium staple cotton. The negotiations lasted over a week and there was no indication of an agreement being reached till the last round of talks.

Reliable sources have indicated that these imports would consist of four varieties and the quantity of each type expected to be imported is between 20,000 bales and 30,000 bales. The price charged by Pakistan will be in the range of Rs 4,680 to Rs 5,025 per candy and the entire deal is for September. The prices are on the c & f basis and the mills will have to incur an additional expenditure of about Rs 250 to Rs 300 per candy by way of L/C charges, interest clearing and forwarding charges and CCI commission.

The southern India mills which supply yarn to handlooms and which had complained the most about the shortage of this type of cotton will get a preference in the allotment provided of course they keep the yarn prices stable. Exporting mills will also be given a preference but, of course, the question of preference will arise only in case the demand exceeds the volume of imports arranged. In fact the Commerce Ministry has stipulated an export obligation of 1 kg of textiles against 1.4 kg of imported raw cotton.

A situation of shortage in medium staple varieties could have been avoided if the Cotton Corporation had not exported this variety at the beginning of the season. The Corporation reportedly shipped abroad five lakh bales of the fibre in its anxiety to dispose of what it considered was mounting stocks with it. It has now contracted to sell the longer variety of *Suvin* mainly to Indonesia. It is strange that the *Suvin* variety should find no customers among mills and we should be compelled to export it. One estimate made is that if the industry goes "finer" as much as five to six lakh bales of cotton can be saved. But the problem for the industry is the unproportionate excise duty that finer cloth attracts. Cotton exports can be understood if there is surplus yield but we are not in that happy position.

Bullion: Reduction in sales tax ?

THE bullion trade in Maharashtra has been upset over the new sales tax of four per cent which came into force from July 1. For three days most of the bullion shops in Maharashtra suspended their business and now again are threatening to launch an agitation from August 15. A decision to this effect was reached at a meeting of the representatives of bullion trade in Nagpur. The trade talks freely of many of them shifting their business to Gujarat and Madhya Pradesh where the sales tax on gold and silver ornaments and primary metal is much lower than in Maharashtra.

A feeling has grown, however, that the Maharashtra Government may consider a reduction in the sales tax to one per cent and pass a legislation to that effect in the monsoon session. There has been no official indication to this effect as yet. But the trade considers that in view of the hardships caused to it and the representations made by it the government will concede the point. If Maharashtra's sales tax is reduced to one per cent, it will be more or less of the same order as in Gujarat and Madhya Pradesh. The off-shoot of the sales tax being raised to four per cent has been that the arrivals during July were the lowest in recent years. Silver arrivals which were of the order of 5,000 kg a day have gone down to 50-60 kg a day. Similarly gold arrivals which totalled 30-40 kg have gone down to 5 kg a day.

Silver smuggling from China too

SILVER is not smuggled out of only India. Surprisingly this also happens in China and reports have it that during the last 18 months London dealers estimate that as much as $200 million worth of silver coins have been sent out from China to European refineries. If fast-moving mechanised *dhows* operate on the Indian coast to transport silver to Dubai and bring in gold from that Shaikhdom silver is taken out of China by small fishing boats plying illegal trade with Hongkong. The flow has been largely in the form of silver coins of Chinese origin and minted in places ranging from the US and Mexico to Vietnam and France. When last year the price of silver shot up to $50 an ounce many tonnes of these coins reportedly buried in underground hoards, following the post-1949 clamp down on private ownership of gold and silver, were unearthed to be sent to Hongkong. As in the case of India the flow has slackened with the sharp drop in silver prices to $8.5 an ounce but smuggling still continues. Silver stocks in China in 1932 were put at 50,000 tonnes worth $15 billion at present prices. The official holdings currently are believed to be only worth $2 billion.

COMMODITIES

Limited activity in cotton

Bombay, July 27

Minor fluctuations were noticed in the spot cotton market during the past week. Business was confined to a few lots of short staple cotton. The focus of attention among cotton traders was on whether the Government of Maharashtra would succeed in persuading the Centre to continue with its cotton procurement scheme.

After a lot of dilly-dallying, the Chief Minister of Maharashtra was able to convince the Centre of the significance of the monopoly procurement scheme for the welfare of the State's cotton cultivators.

The Centre, however, has resorted to considerable dilution of the original scheme, before okaying it. How exactly the scheme will be implemented is still not known. It is quite on the cards that the monopoly character of the scheme will no longer be there as the Cotton Corporation of India will also be operating along with the Maharashtra State Co-operative Marketing Federation. Another point about which no clarification has as yet been made is whether the scheme could continue to depend on the munificence of the Reserve Bank of India as in the past. It is also to be made clear whether the extension of the scheme will be only for one year or for ten years as the State had been pressing for.

Depending on the modus operandi eventually decided upon, one can be sure that the champions of cotton growers in other cotton growing states like Punjab, Gujarat and Tamil Nadu will also stake their claims for emulating the example of the Government of Maharashtra.

The CCI has finalised a deal with the Tamil Nadu Textile Corporation for the supply of 10,000 bales of short and medium staple cotton at a concessional rate. The Textile Corporation owns 14 co-operative mills. Similarly, the CCI has also sold 50,000 bales of cotton to the National Textile Corporation.

The Centre's scheme to promote consumer awareness of handloom products through a national collection of cotton printed sarees was initiated in Tamil Nadu under the auspices of Co-optex, the apex handloom weavers' society in Tamil Nadu. Co-optex has prepared a corporate plan for 1981-82 for achieving a sales target of Rs. 75 crores as against Rs 47 crores in the previous year.

The following has been the trend of prices of some of the leading varieties of cotton :

(Rs. per candy)

	July 24	July 17
Digvijay	5,050-5,100	5,100-5,150
Kalyan	4,800-4,900	4,800-4,900

MCU 5 Guntur	5,900-6,100	5,900-6,100
Jaydhar	4,850-5,000	..

Rising trend in yarn

Bombay, July 27

A rising trend was noticed in the local yarn market during the past week. The prices of 150D NRC, 120D NRC, 120D CR and 150D acetate was quoted at Rs 51.89, Rs 54.23, Rs 50.66, Rs 54.52, Rs 42.40 as against Rs 50.11, Rs 52.03, Rs 49.56, Rs 52.31 and Rs 41.85 respectively. The price of 100D SIV however, remained unchaned at Rs 55.07.

Jutegoods steadier

Calcutta, July 27

A steadier tone was in evidence in jute goods in the Calcutta gunny market during the past week, reflecting largely speculative buying induced partly by optimism over Government granting cash subsidy to the industry for jute goods exports.

The industry has been urging that in the face of the current recession in demand for jute manufactures, especially for carpet backing, the industry would be able to clear its stocks only by offering concessional price to overseas buyers. This, it said, called for some cash incentive. Prices of both hessian and sacking scored gains as a result of the speculative buying during the week.

It is pointed out that export of jute goods by Indian mills once again suffered a setback during June. Despite a marginal increase in the export of hessin to 15,700 tonnes in June, the overall export despatches declined from 33,300 tonnes to 30,900 tonnes. What is particularly disappointing about the set of statistics released by the Indian Jute Mills Association is the fall in exports of carpet backing cloth from 7,600 tonnes to 6,500 tonnes.

Overseas despatches of sacking well lower at 8,000 tonnes against 9,400 tonnes and of other manufactures by 100 tonnes to 700 tonnes. In June 1980, the total export of jute goods was higher at 35,300 tonnes even though the industry could ship as little as 2,700 tonnes of carpetbacking.

The industry fared still worse in the domestic market which took 55,000 tonnes in June against 62,500 tonnes in May. A lower quantity of 36,900 tonnes of sacking material compared with 44,000 tonnes in May was despatched to domestic consumers. Despatches of hessian fell from 9,000 tonnes to 8,800 tonnes and of other manufactures from 9,100 tonnes to 8,900 tonnes.

Mills reporting to IJMA consumed 5,41,000 bales of raw jute (5,68,000 bales) to produce 94,700 tonnes (98,000 tonnes) in June. During the 1980-81 season the industry consumed a higher volume of 68,65,000 bales against 67,83,000 bales in 1979-80. The industry began the new season (1981-82) with raw jute stocks of 11,48,000 bales. It was also credited with an undelivered balance of 4,82,000 bales. Purchases of raw jute during June were 3,36,000 bales.

The fibre market was steady during the week under review with activity moderate aided by fresh mill buying coupled with absorption by the Jute corpo-

FORM NO. II A

Form of General Notice to be given to the members of the Public before making an application to the Central Government under Sub-Section 2 of Section 22 of the Monopolies & Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the Public that I (R. Krishnaswamy) proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under Sub-Sec. (2) of Sec. 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for the purpose of doing Travel Agency Business.. The estimated turnover of the business is likely to be about 10 lakhs.

1.	Name of the Proposed undertaking	MID-WAY INTERNATIONAL
2.	Details of the management structure	Partnership firm Partners : Sri R. Krishnaswamy 1133, Trichy Road Coimbatore-5. Smt.Srivalli Krishnaswamy 1133, Trichy Road Coimbatore-5. Sri R. Krishnaswamy Father & Guardian for minor Mr. K. Rajesh 1133, Trichy Road Coimbatore-5.
3.	Capital Structure of the applicant	Rs. 25,000/-
4.	Proposed location of the new undertaking	No. 338, Avanashi Road, Coimbatore-641018
5.	Brief outline of the cost of project the scheme & source of finance.	Rs.25,000/- Partner's contribution Further funds will arranged depending on the particular orders from Banks & Internal resources

Any person interested in the matter may make a representation to the Secretary, Department of Company affairs, Government, of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of the Notice intimating his views on the proposal and indicating the nature of the interest therein.

Dated this 22nd July, 1981

Place : Coimbatore 641 005.

Sd/-
R. Krishnaswamy

NOTICE

FORM—IA

(See Rule 4A(I))

It is hereby notified for the information of the public that The Travancore Electro-Chemical Industries Limited, proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (I) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969 for substantial expansion of its activities. Brief particulars of the proposal are as under :—

I.	Name of the body corporate owing the undertaking	The Travancore Electro-Chemical Industries Limited.
2.	Capital Structure of the applicant Undertaking	Authorised Capital—Rs.5 Crores. Issued and subscribed Capital—Rs. 1.50 Crores (as per last audited Balance Sheet)
3.	Details of the proposed substantial expansion (a) Name of New goods to be pro-- duced.	Electrically calcined Anthracite Coke.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of the Notice, intimating his views on the proposal and indicating the nature of his interest therein.

For THE TRAVANCORE ELECTRO-CHEMICAL INDUSTRIES LIMITED

Sd/-
H.P.VYAS
CHIEF EXECUTIVE

Dated, this 1st day of August, 1981.

The Mafatlal Fine Spg. & Mfg. Co. Ltd.

Registered Office :
Mafatlal Centre, Nariman Point,
Bombay 400 021.

To
The Members
THE MAFATLAL FINE SPG. & MFG. CO. LTD.

NOTICE IS HEREBY GIVEN THAT the 50TH Annual General Meeting of THE MAFATLAL FINE SPG. & MFG. CO. LTD., will be held at Patkar Hall, 1, Nathibai Damodar Thackersey Road, Bombay 400 020, on Friday, the 4th September, 1981 at 3.00 P.M. to transact the Ordinary Business and the Special Business mentioned in the Notice convening the said Annual General Meeting. The Annual Report and Statement of Accounts for the Financial Year ended 31st March 1981 are being posted to the Members individually at their registered addresses along with the said Notice.

NOTE

A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

By Order of the Board
N. D SONDE
SECRETARY

Bombay :
Dated : 9th July, 1981

ration of India. As a result, the price of W-5 grade jute was maintained at Rs 231 per quintal throughout the week. Inflow of the fibre was fair normal for this time of the year. The arrivals are expected to gain further momentum, next few month, trade quarters said.

Castor oil better

Bombay, July 27

Prices of castorseed and its oil moved up in the oilseeds market during the past week because millers were showing interest. Export demand for castor oils was, however, at a low ebb. Castor Madras small rose from Rs 318 to Rs 322 and Kanpur bold from Rs 310 to Rs 314 per 100 kg. Castor oil commercial edged up by a rupee to Rs 68.50 and costor oil BSS by 50 paise to Rs 73.50 per 10 kg.

A small rise was noticed in groundnut because of paucity of supplies and limited stocks. Karad bold gained Rs 2 at Rs 629. Saurashtra bold and Saurashtra quality also recorded Rs 2 each at Rs 634 and Rs 638 per 100 kg. Groundnut oil after fluctuating narrowly between Rs 153.38 and Rs 151.84 closed at Rs 152.36 against the previous week's Rs 152.88 per 10 kg.

Imported oils ruled quiet on slack demand. Palmoleine dropped from Rs 142.88 to Rs 141.96, soyabean from Rs 141.50 to Rs 141.44 and RBD from Rs 124.80 to Rs 123.76 per 10 kg.

Linseed and its oil hardened in view of the poor arrivals. Linseed bold advanced to Rs 500 per 100 kg from Rs 480 and its oil to Rs 128.96 from Rs 125.50 per 10 kg.

Among cakes, groundnut expeller looked up by Rs 50 to Rs 2,050 per tonne. De-oiled cake, however, was steady at Rs 1,575 on poor export demand. Likewise, castorseed and cottonseed also remained steady at Rs 775 and Rs 1,600 per tonne.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :

	25-7-1981	18-7-1981
G. Nut		
Karad bold	629.00	627.00
G. nut oil	152.36	152.88
Cast. Md. Sm.	322.00	318.00

Foodgrains divergent

Bombay, July 27

A divergent trend was noticed in the grains market during the week under review.

Among cereals, wheat superior receded sharply by Rs. 17 to Rs 275-330 per quintal on good inflow and poor demand. The Saurashtra variety of wheat declined by Rs 5 to Rs 215-235 per quintal as supplies were good from Gujarat amidst slack demand. The undertone was hesitant.

Rice ruled steady. Basmati was traded at Rs 450-600 per quintal and Surti kolam fetched Rs 340-400 per quintal.

Coarse grains ruled steady to better over the week. Jowar gained Rs 3 to Rs 190-225 per quintal. Bajra rose by Rs 10 to Rs 185-230 per quintal on good demand. Maize ruled steady at Rs 155-160 per quintal.

Among pulses, masoor dal spurted by Rs 25 to Rs 515-520 per quintal on limited supplies and good demand. The undertone was steady to firm. Grain prices flared up by Rs 24 to Rs 420-435 per quintal on poor arrivals and encouraging advices from the producing centres. Moong (chumki) rose Rs 12 to Rs 450 per quintal on paucity of supplies. The undertone was firm. Tur dal declined by Rs 7 to Rs 495-590 per quintal as buyers were cautious. Activity in urad (khandesh) was limited and prices dropped by Rs 10 to Rs 310-315 per quintal.

Modest recovery in sugar

Bombay, July 27

Sugar staged a modest recovery in the local market last week with the price of C-30 grade increasing by Rs 18 to Rs 615-630 per quintal. The recovery was attributed to better demand at a lower level. The Centre's decision to release 1.70 lakh tonnes of free sale sugar for domestic consumption in August as against 1.80 lakh tonnes for the current month hardened market sentiments. The State sugar factories too, jacked up their prices to Rs 625 per quintal. The price of sugar C-10 as on July 25, 1981 was Rs 157 per quintal lower than on the corresponding date a year ago.

The wholesale market received 26,083 bags and disposed of 29,655 bags. The week end stocks with the stockists increased to 4,831 bags from 3,572 bags at the previous week end.

Khandsari stocks in the market were virtually exhausted. The commodity was nominally placed at Rs 590-595 per quintal.

Tea : CTC in good demand

Calcutta, July 27

Shipments of tea from Calcutta have improved appreciably in recent months with the removal of some of the chronic constraints at the initiative of the tea exports monitoring cell. Though container availability is much better now with the formation of ICL, the facilities for stuffing and general handling still leave much to be desired.

Meanwhile, at the end of May, production at 122.23 million kg had a record fall of 12 million kg and it was feared that the deficit might be larger at the end of June. Tea arrivals continue to be poor and in fact they virtually came down to a trickle last week as a result of transportation bottlenecks caused by the recent floods in Assam.

During April to May 1981 India shipped out a total of 31,05 million kg of tea against 24.02 million kg in the corresponding period a year ago. The value realised was Rs 54.06 crores and Rs 45.62 crores respectively.

At the weekly leaf tea auctions in Calcutta, the 25,770 packages of CTC tea offered met with a good demand. Dooars brokens were well absorbed by the Punjab and Gujarat buyers. For the larger brokens, there was useful inquiry forthcoming from the USSR which operated for these up to Rs 14.50 per kg. Medium and good liquoring Assam brokens found inquiry from the Gujarat buyers. There was fair support from the blenders as well as the internal buyers. The Gulf and the UK exporters operated for better liquoring kinds. The USSR supported the larger brokens up to a limit of Rs 16.50 a kg.

Good Dooars fannings were steady, whilst the remaining Dooars descriptions were slightly easier. These were accounted for by the Gujarat and northern India buyers. Assam fannings met with good inquiry from the blenders and the UK shippers. Prices for these were irregular and lower by 60 to 80 paise.

The 8,331 packages of Darjeeling teas offered met with fair demand. The USSR continued to absorb the bulk of the black, clean whole leaf grades at last levels. Better liquoring varieties met with selective support from the West German and Japan buyers and levels recorded a decline. All Darjeeling brokens were readily absorbed though at slightly easier rates. Clean brokens saw some inquiry from the USSR with support from the internal buyers. Selective traditional export inquiry was also forthcoming. Fannings followed a similar trend, being absorbed by the local dealers with selective export interest.

The 47,400 packages of orthodox teas offered at the sale met with a good demand. Orthodox brokens met with good demand but at lower levels. Prices for these eased by approximately Re 1 per kg. Whole leaf grades followed a similar trend. The USSR continued to dominate the market whilst there was better inquiry from the buyers for Iran. The Afghanistan buyers competed for the medium descriptions on offer, but at lower levels.

Lady Inorganic Chemistry Ph.D. Available for Consultation for Starting and Running Small / Medium Chemical / Pharmaceutical Industries Western India. Process Knowhow Available. Contact Box No. 1107. C/o. Commerce, Manek Mahal, 90, Veer Nariman Road, Bombay 400020.

NOTICE

It is hereby notified for the information of the public that VOLTAS LIMITED proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (I) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of its activities. Brief particulars of the proposals are as under :

(I) **Name of body corporate, owning the undertaking.** VOLTAS LIMITED

(II) **Capital structure of the applicant undertaking as on 31.7.1981)** .. .. Rs.

	Rs.
Authorised :	
9,98,000 Equity Shares of Rs. 100/- each	9·98,00,000
20,000 Equity Shares of 'B' Series of Rs. 10/- each	2,00,000
	10,00,00,000
Issued, Subscribed and Paid up:	
6,27,796 Equity Shares of Rs 100/- each fully paid	6,27,79,600
14,117 Equity Shares of 'B' Series of Rs. 10/- each fully paid	1,41,170
	6,29,20,770

(III) **Details of the proposed substantial expansion :**

(a) Names of the new goods to be produced, supplied, controlled or distributed or of new services to be rendered	Not applicable.
(b) In the case of substantial expansion of existing activities	
(i) Name of goods	Domestic Refrigerators
(ii) Capacity before expansion	11,000 Nos. p.a
(iii) Expansion proposed	89,000 Nos. p.a (Capacity after expansion 1,00,000 Nos. p.a.)
(iv) Location of the project for substantial expansion	Backward area in Maharashtra, to be decided in consultation with the State Govt.

(IV) **Brief outline of the cost of the project, the scheme and sources of finance.**

Estimated cost of the project

		(Rs. in lakhs)
1.	Land and site development	8.00
2.	Buildings	240.00
3.	Plant & Machinery	260.00
4.	Furniture & Office equipment	15.00
5.	Contingency & Escalation.	26.00
6.	Margin money for working capital	43.00
		592.00

Means of finance

		(Rs. in lakhs)
1.	Internal resources	124.00
2.	Capital subsidy from Central Govt. (Pioneer Unit in a notified backward area).	40.00
3.	Secured long-term and medium-term loan from SICOM and All-India Financial Institution	428.00
		592.00

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein

FORM IA

See Rule 4A (I)

Form of general notice to be given to the members of the public before giving a notice to the Central Government under Sub-Section (I) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the public that ELECON ENGINEERING COMPANY LIMITED proposes to give to the Central Government in the Department of Company Affairs, New Delhi a notice under Sub-Section (I) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of its activities. Brief particulars of the proposal are as under:

(i) Name(s) of person(s)/body corporate owning the undertaking. ELECON ENGINEERING COMPANY LTD

(ii) Capital structure of the applicant undertaking. (as on 31.12.1980)

(a) AUTHORISED SHARE CAPITAL :

2,50,000	Equity Shares of Rs.100 each	Rs. 2,50,00,000
24,000	9.8% Cumulative Redeemable Preference Shares of Rs.100 each	Rs. 24,00,000
26,000	Unclassified Shares of Rs. 100 each	Rs. 26,00,000
		Rs. 3,00,00,000

(b) ISSUED, SUBSCRIBED AND PAID UP CAPITAL:

1,62,000	Equity Shares of Rs.100 each	Rs. 1,62,00,000
24,000	9.8% Cumulative Redeemable Preference Shares of Rs.100 each	Rs. 24,00,000
		Rs. 1,86,00,000

(iii) Details of the proposed substantial expansion ;

(a) Names of new goods to be produced, supplied, controlled or distributed or of new services to be rendered. — Spiral Bevel, Hypoid Differential Gear Sets' Helical, Spur, Straight Bevel Gears & Worm Gears for Automobiles & Tractors—1000 tonnes

(b) In the case of substantial expansion of existing activities.

(i) Name of goods — Spiral Bevel, Hypoid Differential Gear Sets, Helical, Spur, Straight Bevel Gears & Worm Gears for Automobiles & Tractors-1000 tonnes.

(ii) Capacity before expansion — 10000 Worm Reduction Gear Units. 2500 Helical Gear Units.

(iii) Expansion proposed — 1000 Tonnes per Annum, for items under Sr No. (iii) (a)

(iv) Location of the project for substantial expansion. — In the Company's existing Factory at Vallabh Vidyanagar, Gujarat.

(v) Brief outline of the cost of the project, the scheme and source of finance.

Cost of the Project

Land,	—	Rs. Nil
Buildings,	—	Rs. 100 lacs
Plant & Machinery	—	
Imported	—	Rs. 600 lacs
Indiginous	—	Rs. 200 lacs
		Rs. 900 lacs

Source of Finance

The project will be financed by loans from Financial Institutions, additional capital and partly from our own Internal resources.

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

For ELECON ENGINEERING COMPANY LTD.,

B.I.PATEL

(Chairman & Managing Director)

VALLABH VIDYANAGAR

Dated this Ist day of August, 1981.

The 20,950 packages offered at the dust sale met with a good demand. Medium and good Dooars CTC dusts were well supported by the internal buyers. There was fair inquiry from the major blenders. Assam CTC dusts were well supported by the Gujarat buyers and the packeteers. For the better liquoring descriptions the Bengal buyers lent good support. Medium varieties sold at around last levels, while the better sorts sold at occasionally dearer rates. Exportable Pekoe dusts met with fair inquiry from the UK shippers. The ARE did not operate. Medium and good liquoring orthodox dusts met with fair inquiry and sold at around last levels. The remainder eased in value.

Aggregate deposits and bank credit expand

Bombay, July 27

Aggregate deposits of the scheduled commercial banks increased by Rs 140.59 crores to Rs 40,542.61 crores during the week ended July 17, 1981. Bank credit expanded by Rs 134.61 crores to Rs 26,732.98 crores. Balances of banks with the Reserve Bank of India (RBI) declined by Rs 123.68 crores to Rs 4,380.69 crores and their borrowings from the RBI declined by Rs 26.26 crores to Rs 545.97 crores.

Gold quiet, silver up

Bombay, July 27

A quiet tendency in gold and an upward trend in silver marked trading in the Bombay bullion market during the past week.

Standard mint gold opened at Rs 1,670 per 10 grams, remained steady at Rs 1,685 per 10 gms from Tuesday to Friday (July 21-July 24) and came down to Rs 1,680 per 10 gms before finally closing at Rs 1,675 per 10 gms. Ready silver (.999 fineness) opened at Rs 2,465 per kg and closed at Rs 2,515 per kg.

Money comfortable

Bombay, July 27

Conditions in the Bombay short-term money market were comfortable during the past week. Both notified and commercial funds opened at 7 per cent but eased to 5 per cent on Tuesday (July 21) and 3½ per cent on Thursday (July 23). The interest rates came to the week's low of 3 per cent on Friday (July 24). The rates however, hardened subsequently to 8 per cent before finally closing at 6½ per cent.

CIBATUL LIMITED

NOTICE

IT IS HEREBY notified for the information of the public that the Company proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for establishment of a new undertaking for the manufacture of following goods. Brief particulars of the proposal are as under:

(i) Name(s) of person(s)/Body Corporate Public Limited Company, CIBATUL Ltd. owning the undertaking.

(ii) Capital structure of the applicant.

	(Rs.)
AUTHORISED: 5,00,000 Equity shares of Rs 100/- each	5,00,00,000
ISSUED : 3,00,000 Equity shares of Rs. 100/-issued and fully paid up	3,00,00,000

(iii) Details of the proposed substantial expansion :

(a) Name of new goods to be produced, supplied, controlled or distributed or of new services to be rendered.

	Items of manufacture	Capacity per annum.MT
1	Epichlorohydrine	6000
2	Glycerine	2750
3	Hydrochloric Acid 35%	9120
4	Sodium Chloride	1300
5	Mixture of 1-2-dichloropropane) 1-3-dichloropropene)	840

(b) In the case of substantial expansion of the existing activities :— Not applicable, as we are not going for any expansion of the existing activities.

(iv) Proposed location of the new undertaking — Either at the location of the existing factory a Atul, Dist. Valsad, Gujarat or near Hindustan Organic Chemicals Ltd. at Ambalamugal near Cochin (Kerala)

(v) Brief outlines of the cost of the project, the scheme and source of finance. — Land, Rs. 10 lakhs, Building Rs. 1 crore, Machinery Rs. 15 crores including imported equipment valued at Rs. 1.50 crores c.i.f., Know-how fees approx. Rs. 1.90 crores including basic engineering and commissioning.

The company will decide with financial institutions as to the additional equity capital and term loans that may be required in addition to the internally generated funds to meet the cost of the project.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

Cooperation: Big push to agro-based industries

Concluded from page 288

ives if they resort to open market operations. This co-operative industry could be effectively made a nucleus of socio-economic uplift of the handloom weavers. It can also implement programme for augmenting the per acre yield of cotton which is lowest in the world in our country.

In Maharashtra State the government has introduced monopoly purchase scheme for cotton. The grower thus is assured of adequate return when he sells cotton to government through the marketing federation. He will not evince any interest in further processing of cotton and cottonseed unless the processing society undertakes activities to guide him in increasing the yield and undertakes to meet his needs of edible oil, or cattlefeed prepared from the cottonseed cake. Permanent arrangement will have to be thought of which will assure supply of cotton and cottonseed to the co-operative units without going to the auctions. A complex can be developed with the marketing federation as one of the partners along with the producers and weavers in the area. This complex can be of spinning mills, ginning mills, oil units, cattlefeed etc. The original concept to enroll only growers as members will have to be modified and enlarged. Further, as in the case of private industries they will have to bring ancillary activities under their fold with a view to bringing stability to the industry.

A few fruit processing societies based on banana, grapes and oranges also failed for the main reason that they depended only on the product. Here too the society will have to undertake processing of different fruits although it can specialise in one item.

From the past experience with agro-based industries in a co-operatively developed state like Maharashtra one can foresee a bright future for them. The co-operators will have to learn from the past mistakes in establishing processing societies in future. Firstly, they will have to increase the share capital base to the extent of 40 per cent of the total project cost. The scheme should be attractive to the producer members and there should be their direct involvement. The co-operative spirit should be evident in working and the benefit should go to the people for whom the industry is established.

Beyond headlines

Cooperation: Big push to agro-based industries

By M. G. CHANDRACHUD

WHEN we think of agro-based industries in co-operative sector we have before us the remarkable progress made by the co-operative sugar factories during the past thirty years. After the establishment of the first co-operative sugar factory in 1950 at Pravaranagar in Maharashtra there are today 185 co-operative sugar factories in the country (as on June 30, 1978). Out of these 128 factories were in production and they crushed 297 lakh tonnes of sugarcane and produced sugar worth Rs 600 crores. Maharashtra State alone accounts for more than 50 per cent of these sugar co-operatives. These co-operative sugar factories have transformed the whole rural area wherever they are in operation. Besides the well-being of the members, the management of the factories have established schools and colleges, hospitals and recreation centres for the general public. These factories have provided employment opportunities in the rural areas and have helped in arresting the migration of rural population to the cities.

Encouraged by this success, efforts have been made in the past two decades to establish other agro-based industries, namely, oilseeds processing, ginning and pressing facilities, rice milling, fruit processing, spinning mills, etc in co-operative sector in different areas in Maharashtra for the benefit of the growers. But these processing facilities could have succeeded and as such even today the growers of these produce have to rely on traders for the sale of their produce.

As back as in 1960 an integrated groundnut processing project was implemented in the co-operative sector in Sangli district where the acreage under groundnut was five lakhs. Twenty oil mill expellers were set up all over the district and a solvent plant was set up at the district headquarters. The grower-members were supposed to give their groundnut to the mill and the mills were to send the oil cake to the solvent plant. The growers were offered advance calculated on the basis of past three years' ruling prices and expected prices in the current year. The balance was to be paid after sale of the oil and cake. The growers, however, were reluctant to accept this arrangement. They insisted for hundred per cent amount no sooner they delivered the groundnut. As a result due to fluctuations in the prices of groundnut oil and cake the project went into red. The oil mills and the solvent plant suffered continuous losses. Price fluctuations apart, the project being conceived only for processing of groundnut, the expellers and the solvent plant were running hardly for 90 to 100 days in a year and that too below rated capacity. It was also revealed that the growers were bringing their produce to the processing societies when prices in the market were low and selling the produce in the market at higher rates when prices ruled better outside. The interests of the institutions established for their ultimate betterment were overlooked for temporary gains.

Another important point that contributed to the failure was the type of groundnut grown in the area. The quality cultivated had only 40 per cent oil as against 45 to 48 per cent in the variety used for expelling purposes. Moreover, unlike the sugarcane, which cannot be stored after harvesting, the groundnut can be stored in godowns even up to a period of one year. The grower can opt for this option if he finds that the prices are not favourable.

Of the integrated units, the solvent plant has now, however, turned the corner and is making profit. The unit was saved because it started processing all types of cakes and rice bran by purchasing in the market. The society also offered its plant to others on "service basis". As a result it worked for all days according to the capacity and made good the past losses. As a "commercial unit" the plant is now working successfully.

Next to sugarcane, groundnut is an important cash crop in Maharashtra and naturally efforts were made to set up oilseeds processing units in co-operative sector. But practically all units failed for reasons stated above. As a matter of fact, edible oil is an item of every day necessity. However, it is unfortunate that the industry is in the hands of traders and there are wide fluctuations in the prices of oil. If past experience is any guide, the co-operative will have to do some rethinking on establishing oilseeds processing units and selling the oil, the cake, etc directly to consumers in cities. One may recollect that when co-operative sugar factories were established, care was taken to approach expert agriculture officer to look after the yield of sugarcane. With this arrangement services of experts were available to the smallest member of the society to augment his yield per acre. In other processing societies this aspect was totally overlooked. If, therefore, oilseeds processing societies are to run successfully they will have to adopt modern practices that exist in private industries and also give attention to increase the farm yield.

Dr Kurien of "Amul" fame has suggested establishment of oilseeds processing industries on the lines of milk societies. The oilseeds from villages would be collected directly from members and supplied to the complex located at a suitable place. This complex would process all oilseeds and oilcakes by putting large expeller, solvent plants. This would facilitate production of commodities required to farmer-members of the complex. If their requirements are also met they will develop more interest in the complex. At present, after the produce is handed over to the society, they have no affection for the processing society. As a result the society remains co-operative only in name.

Besides oil mills, spinning mills, ginning societies and a few cottonseed processing societies were also established by the producers to process cotton which is a cash crop in the Maharashtra State. As is well-known the spinning mills of the weavers have proved more successful than of the producers. In the year 1978-79 there were 88 spinning co-operatives in production. They produced 73.54 million kg of yarn. The production of yarn is only about eight per cent of the requirements of handlooms. There is thus immense scope for growth of composite units of growers as well as weavers. There is, however, no point in organising spinning co-opera-

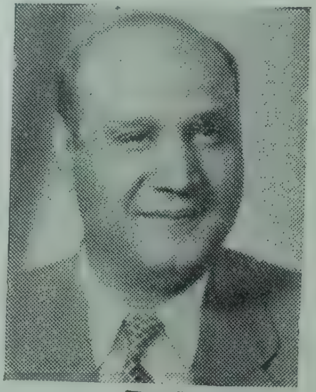
PEOPLE

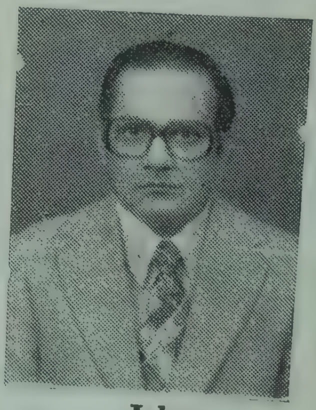


Paul

Mr Stya Paul, the well-known industrialist, has been elected president of the Federation of Engineering Industries of India. He is a founder-member of FEII and has been on its executive council for the last four years. Mr Paul belongs to the Aminchand Payarelal group and is chairman of Apeejay-Surrendra group of companies. His interests cover steel rolling, engineering, shipping, pharmaceuticals, hotels, chemicals, etc etc.

Swaminathan

Mr Anand Swaminathan, former chairman and managing director of Hindustan Organic Chemicals Ltd and Hindustan Antibiotics Ltd, has joined Humphreys and Glasgow Consultants Private Ltd as managing director. Before his present assignment he had a brief stint as contract manager with Humphreys and Glasgow Ltd, London. Mr Swaminathan started his career with Friedrich Uhde, West Germany, and on return to India he worked in NOCIL and Standard Alkali.

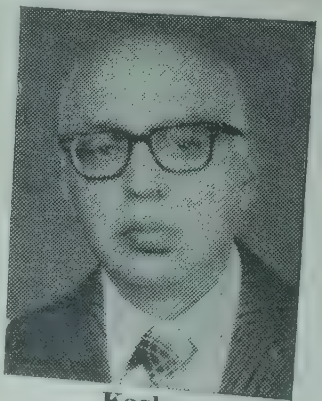


Jalan

Mr R. N. Jalan, who has been elected vice-president of the Federation of Andhra Pradesh Chambers of Commerce and Industry, following the death in a car accident of Mr V. Basavaraju, is the president of Hyderabad Asbestos Cement Products Ltd since 1965. He is also a director of Nucon Industries Pvt Ltd, Hyderabad, and Nigerian Asbestos Industries Ltd in Nigeria, apart from being associated with many industrial organisations in India and Saudi Arabia.

Parthasarathy

Mr R. Parthasarathy, IAS, has taken charge as executive director of Gujarat Narmada Valley Fertilizers Co Ltd, Bharuch. Mr Parthasarathy, who has had a brilliant academic record, taught chemistry at Delhi University before joining IAS in 1963. He has had since then wide experience in various organisations of the Gujarat Government. Before joining GNFC, he was the managing director of Gujarat State Cooperative Land Development Bank.



Kashyap

Mr M. N. Dandekar has been appointed chief regional manager at Aurangabad regional office by the State Bank of India.

Mr D. N. Ghosh, IAS, has been appointed additional secretary and financial adviser in the Ministry of Steel and Mines.

Mr Arjandas Kashyap has been re-elected president of the Indian Stainless Steel Rerollers Association for the ensuing year.

THE WEEK

Prime Minister, Mrs Indira Gandhi, in her keynote address to the UN Energy Conference at Nairobi on Monday has called for a world policy to ensure equitable distribution of conventional energy and joint development of new and renewable energy sources. She attributed the present energy crisis to reckless exploitation of conventional energy by advanced nations.

★

The policy for distribution of textile export quota for 1982, finalised by the Government on Monday, raises the share of past performance quotas in the annual level of garments and knitwear by five per cent to 45 per cent. It also empowers the concerned export promotion councils to determine entitlements of exporters.

★

Sugar co-operatives in Gujarat have urged the Union Government to create a separate Saurashtra zone for sugar in order to get a reasonable price for sugarcane produced in the zone. The cost of production there is said to be high owing to scanty rainfall.

★

The import of sub-standard nylon yarn has been decanalised by the Government subject to quantity limit. However, imports will not be under OGL and will be subject to licences to be issued by the JCCI&E.

★

In a reshuffle of cabinet portfolios effected by Prime Minister, Mrs Indira Gandhi, the Planning Minister, Mr N. D. Tiwari, has been shifted to the Ministry of Industry and Dr Charanjit Chanana, who was till now holding independent charge of this ministry, will be now minister of state. Mr S. B. Chavan, Education Minister, has been given the charge of Planning, and the minister of state for education, Mrs Sheila Kaul, will look after the education ministry. The Government also effected wide changes at the secretaries' level.

★

The Union Cabinet has approved the take-over by the Government of Oil India Ltd and Assam Oil Co Ltd. A bill for the purpose will be introduced in the next session of Parliament beginning on August 17. The take-over will be with retrospective effect from January 1, 1977.

★

Maharashtra Government has fixed a target of 17.47 lakh bales of cotton under its monopoly procurement programme for 1981-82 season which is expected to come into being with certain modifications from August-end or early September.

★

Wholesale price index

At 285.0, the latest available wholesale price index for the week ended July 18, 1981 showed a rise of 0.1 per cent over the preceding week and 9.6 per cent over the year.

Money comfortable

Conditions were comfortable in the local short-term money market as of Monday (August 3, 1981). Both notified and commercial funds were renewed at seven per cent. Fresh money was transacted at 6½ per cent.

COMMERCE

Levels of living: Miles to go

INDEPENDENCE has enhanced the prestige of the country and of the people in the eyes of the world nd has fostered the feeling of freedom and dignity of he individual which is an essential precondition for he development of any nation. Lack of freedom not nly affected us in political matters but equally, nay, ery much more, in economic matters. Freedom has emoved all fetters on the economic and political initiaive of the nation. Consequently Independence has witessed the extension and diversification of agriculture nd industry and the rise in their productivity. Foodrains production has more than doubled; so has agriculural production in general. The growth in industrial prouction has been even more impressive. Simultaneously he expansion in scientific and technical education has nabled the country to possess a large number of qualied persons capable of handling almost any assignment. he dedication and selfless service of some of these cientists and technologists have enabled the country begin to chart its own independent course in some espects. All these achievements are highly creditable nd would seem to indicate a very bright existence for ne people of India. Unfortunately such a desirable ate, which had been so fervently hoped for by those ho had fought for freedom, has not come about and ndependence is yet to have an impact on the vast majoty of the people in terms of an appreciable improveent in their standard of living.

The persistence of abject poverty and helplessness the vast majority of the people represents the most aring failure on the part of those who have been at e helm of affairs of the country since Independence years ago. This failure is all the more deplorable nce the elimination of inequality in all its manifestaons has been the declared policy. The Constitution India itself owes its origin to the resolve of the peoe of India to secure to all its citizens "justice, social, onomic and political; liberty of thought, expression, lief, faith and worship; equality of status and oppornity" and to promote fraternity assuring the dignity the individual. The Directive Principles of State licy of the Constitution say specifically that "the State all, in particular, strive to minimise the inequalities income, and endeavour to eliminate inequalities in tus, facilities and opportunities, not only amongst lividuals but also amongst groups of people residing different areas or engaged in different vocations."

Against this very specific obligation laid down upon se in charge of implementing the provisions of the nstitution of India, what have been the achievements? In 1981 nearly 64 per cent of the people of India are illiterates, the absolute number of illiterates being about 45 crores. In a situation in which a person without education has no scope for participating in the national affairs in any meaningful manner, the illiteracy of such a magnitude puts this vast number of people outside the mainstream of national life, depriving them of all benefits of development. Given the situation, if the fact that nearly 32 crores of people live below the poverty line (i.e. have a per capita monthly consumption expenditure of Rs 76 or less at the 1979-80 prices, corresponding to a minimum daily calorie requirement of 2,400 per person in rural areas, and an expenditure of Rs 88 or less, corresponding to calorie requirement of 2,100 per person in urban areas) does not come as a surprise, it does not become any the more acceptable or desirable. What is still worse is that without a radical change in the orientation of the Government's policy there is not going to be improvement in the condition of living of many crores of people in the near future. By the end of the Sixth Five Year Plan, in 1984-85, there would be still nearly 28 crores of people living below the poverty line. If all the measures for the redistribution of income envisaged in the Sixth Five Year Plan are actually carried out, even then the number of people living below the poverty would be around 22 crores—or about 30 per cent of the expected population of nearly 72 crores. This will be the picture at the end of the 34th year of freedom!

The Sixth Plan projection of the population below the poverty line in 1984-85 shows the continued irrelevance of planning. While the 30 per cent of population at the top of the income bracket accounts for 52 per cent of the total household consumer expenditure in rural areas and even more (54 per cent) in the urban areas, the 30 per cent of the population at the bottom of the income bracket shares only 15 per cent of the total household consumer expenditure in the rural areas and about 14 per cent in the urban areas. Another disturbing feature is that the growing costliness of food has obliged the people, both in the rural and urban areas, to spend a higher proportion of their budget on paying for food over the years. While, according to findings of the National Sample Surveys, in 1970-71 food expenditure of the people constituted about 74 per cent of the total expenditure in rural areas and over 64 per cent in urban areas, by 1973-74 the proportion of food expenditure went up to 75 per cent and 68 per cent respectively in the rural and urban areas. A still more unfortunate development is the decline in the real earnings of agricultural labourers, occupying the lowest rungs of the income structure. The Rural Labour Enquiry 1974-75 yielded the startling disclosure that over the decade ending in 1974-75, there had been a 12 per cent decline in the real earnings of agricultural labourers.

A still more disquieting development is the decline in the availability of certain essential articles. Between 1950-51 and 1979-80 the per capita availability of pulses declined by about 50 per cent, of milk by six per cent, and of cotton cloth by ten per cent. On the other hand the availability of luxury items (i.e. items not entering into the mass consumption) has gone up. This point to the relative neglect of the task to ensure the production of articles of mass consumption in adequate quantities. Planning, as it has worked itself out in th country has thus been irrelevant for this vast numbe of people. The question of redefining the objectives anc means of achieving the goals of planning to make i relevant to the poor can no longer be kept aside. Th growing voice of protest and frustration arising i various parts of the country only underlines the urgenc of the task.

Planning within circles

THE Planning Commission, after a review of the situation, has decided that, in view of the constraints of resources, no new projects are to be added to those already included in the Sixth Five Year Plan for implementation. The effort of the Commission would now be to ensure that all the programmes already included in the Plan are implemented. This conservative approach has been imposed upon the Commission by the knowledge that notwithstanding the measures adopted by the Central Government to augment revenue through raising the prices of petroleum products and mopping up some amount through raising the rate of compulsory deposit by the income-tax payers, the budgetary position of the Central Government is far from being comfortable, the deficit is likely to turn out larger than estimated earlier and that the foreign exchange reserves position is far from comfortable.

One of the factors behind this deterioration in the budgetary position is very much the almost unrelenting rise in prices. During the week ended July 25, 1981, the Wholesale Price Index for All Commodities (1970-71 = 100) reached the all-time high figure of 285.7. This was about 34 per cent higher than the level two years ago and 53 per cent higher than the level three years ago. The two-year old figure is relevant as the Sixth Five Year Plan project costs are stipulated at the 1979-80 prices. This sharp rise in prices has inflated beyond anybody's calculation all costs, including the cost of running the government itself. During the first four month i.e., between March 28 and July 25) of the current financial year (1981-82) the Index rose by as much as about six per cent (an annual rate of over 17 per cent). No budgetary discipline can be enforced if measures are not adopted to arrest and reverse this run-away rise in prices. More than the Central Government, the state governments have been caught up in this inflationary spiral, since they do not have control over sources which could be readily tapped for raising additional revenues and they have even less control over the factors causing inflation. It would not be proper to single out the state governments to condemn them for their alleged reluctance to raise revenues.

There is one area from which considerable revenue could be raised but which now goes virtually untaxed. Agriculture, which draws considerably on the budget of both the Central and state governments, does no contribute much directly by way of taxation. However taxation of agricultural income can never become reality unless there is a consensus among all the political parties to put it beyond electoral politics.

Most important of all, however, is the impositio of accountability on those not fulfilling the Plan target Accountability would make planning both realistic an effective. The Planning Commission has asked project to be estimated at their correct value and not to b underestimated in order to obtain quick clearance. Th Commission is clearly worried about the lack of respon sibility in project formulation. This would be don away with entirely if accountability is imposed. Th imposition of such an obligation is all the more urgentl needed for timely implementation, as the failure in on crucial area tends to impose a brake upon the growt in another crucial area. For example, the unsatisfa tory availability of power has emerged as the most con structing factor in the Indian economy today. Yet th fact that the implementation of the 1980-81 annual pla left a gap of 409 mw in the creation of installed capacity (against the original target of 2,232 mw for th year) has gone virtually unnoticed without anyon being called upon to explain the failure to meet the ta get of additional capacity planned for 1980-81.

Again, planning loses all significance if capacit created at great cost to the people is left unutilised o underutilised. The trade gap during 1980-81 would hav been decidedly lower if imports of aluminium and fe tilisers had not been made or had been lower. Muc of these imports would not have become necessary the available capacity in these two industries had bee better utilised. Widening trade gap is considered factor against undertaking new projects needing import On the other hand the underutilisation of capacity permitted to add to the trade gap by importing commod ties which the country can produce but does not produ in possible quantities. In this context the very lo capacity utilisation (44 per cent during 1979-80 and per cent during 1980-81) of the power plants contribut in no small measure to the constraint on the availabili of power which hampered production during the last tw years.

LETTER FROM WASHINGTON

NORTH-SOUTH DIALOGUE

Reagan promises to show up at Mexico

From HASMUKH SHAH

THE charges of the developing nations that the Reagan Administration is insensitive to issues important to the Third World are becoming so effective in world forums that they are forcing the US Government to change its stance *vis-a-vis* the Third World.

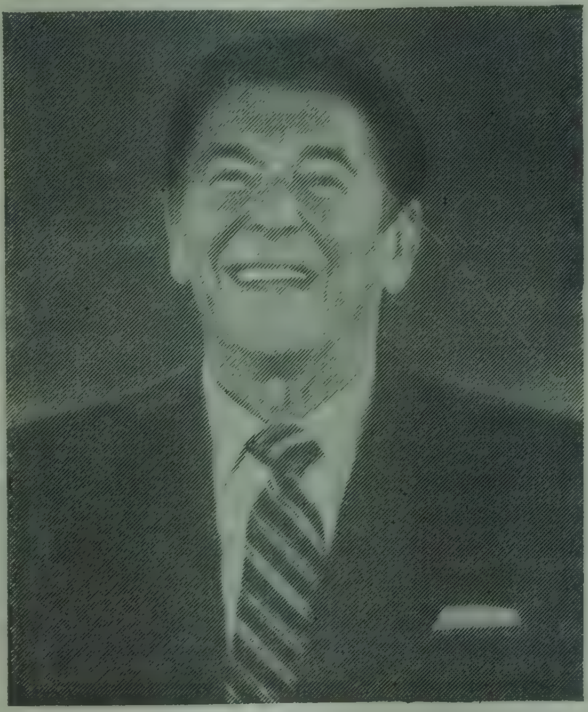
The favourable shift in the US policy towards the Third World was first visible at last month's Ottawa summit of the seven major industrial democracies, when US President Ronald Reagan's Administration subscribed for the first time to the idea of global talks to bridge the economic gap between the wealthy nations of the Northern Hemisphere and impoverished developing nations of the Southern Hemisphere.

Now, further signs of a shift in the US policy in favour of the Third World have emerged at the two-day (August 1-2) conference of foreign ministers of 22 nations—eight industrial countries and 14 developing nations, including India—in Cancun, Mexico's posh Caribbean sea resort. The trend was confirmed at Cancun during the ministerial meeting that determined issues to be discussed at a North-South summit there on October 22-23. Ministers from these 22 nations, ranging from the US, the richest, to Tanzania and Bangladesh, amongst the poorest, decided that the United Nations was the proper forum for global negotiations on the world economy.

The United States had hitherto resisted pressure to negotiate global aid efforts within the world body, where developing nations have a big majority. Delegates from industrialised countries said the new approach of the Reagan Administration would help ensure the success of the October North-South summit, the first time the world's economic iniquities will be discussed at such a high level.

The US Secretary of State, Mr Alexander M. Haig, Jr reportedly indicated in a closed-door session that, while the Reagan Administration gave priority to strengthening the US economy, it was "impossible" to await a United States economic recovery before addressing questions of international co-operation.

In a statement at the Cancun airport before returning to Washington, DC, Mr Haig again stressed the importance of domestic economic policies and urged a strengthening of the world economy "as a result of shared commitment and acceptance of shared responsibility for mutual benefit." "The spirit in which these discussions took place I feel was unusually constructive," he said. "I believe all of us recognise that we have a historic opportunity in Cancun to make a new beginning to relations among our nations. This new beginning would reject the North versus South confrontation and instead examine what we can do to make the world better for all of us and to address the particularly pressing problems faced by a number of the developing nations."



Mr Ronald Reagan

Although President Reagan accepted the invitation of President Jose Lopez Portillo of Mexico last June to attend the Cancun meeting October 22-23, his Administration had until now shown little enthusiasm for the concept of major economic reforms to benefit developing nations. The United States, apparently eager that the Cancun meeting should not become a negotiating forum, insisted successfully at the August 1-2 preparatory meeting of the foreign ministers' procedural discussions that the heads of the state should meet without a formal agenda, prepared position papers or a final communique. Many foreign ministers and diplomats here said nevertheless that Mr Haig had adopted a generally conciliatory posture in private conversations.

"I believe that there has been a real change in US attitudes in the past month," Mark MacGuigan, Canada's External Affairs Minister, said. "The change in the American position is its acceptance of the process of global negotiations. It is hedged, but it is an acceptance."

The foreign ministers decided against a formal agenda for the October summit but agreed on four broad issues for discussions: They are the future of international co-operation for development and the reactivation of the world economy, including food, security and commodities; trade and industrialisation; energy; and monetary and financial questions.

Conference sources said developing countries agreed beforehand not to raise problems at the meeting that could set back international co-operation and development because disputes would hurt themselves.

Some diplomats said the new US attitude owed more to pressures from its Western allies than to increased sympathy toward the developing nations of the South. The French Foreign Minister, Mr Claude Cheysson, seemed to endorse this analysis when he said the United States now had a better understanding of how important the North-South dialogue was for the industrialised nations of the West.

Unlike the United States, countries such as France and Japan are heavily dependent on the South for their raw materials and are sensitive to Third World views. "We form part of an alliance and the United States must, therefore, take our opinion into account," Mr Cheysson said at a press conference.

Noting that the Soviet Union had decided to boycott the Cancun summit meeting, Mr Cheysson said that Washington risked being blamed for any failure in the October meeting. "The fact that the US is willing to participate at the Presidential level means that it is prepared to do something at Cancun," he said. "It is impossible for them to do nothing."

Summarising the results of the August 1-2 talks, the Foreign Minister, Mr Jorge Castaneda, of Mexico emphasised the "excellent atmosphere" of the meetings. "Despite long years of confrontation between two clearly identified groups," he said, "it was truly noteworthy that an exchange of views was possible without confrontation."

He nevertheless cautioned against excessive optimism over what could be achieved in Cancun in October. "Our objectives are modest," he said, "and it could not be otherwise with 22 leaders meeting for only two days. But we hope the summit will be a very important contribution to stimulate the global round of negotiations. It should be an important step along a new road."

In a press statement issued by the ministers, which Mr Haig also accepted, a key phrase said that "a main objective" in October "should be to facilitate agreement with regard to the said global round of negotiations by means of achieving a real meeting of minds and positive political impetus by heads of state or government."

The so-called global round is the latest of numerous attempts by developing and industrialised nations to break their decades-old deadlock in economic negotiations. Since oil prices quadrupled in 1973-74, developing nations have called a series of special UN negotiating sessions for stable commodity prices, greater food aid, debt relief, a bigger say in worldwide lending agencies' policies and access to rich countries' technology and markets for their manufactured products.

The first North-South discussion took place in Paris in 1975 but broke down without agreement after 18 months. Last year at the United Nations, the countries of North and South again failed to agree on an agenda for a global round, with industrialised nations strongly resisting the demand that the development issue be linked and negotiated in a single forum.

Although developing nations have long struggled, and failed, to obtain significant economic concessions from the industrialised North, their position won powerful endorsement last year from a report issued by a special commission on development headed by the former West German Chancellor, Mr Willy Brandt, who also conceived the idea of a North-South conference.

The political significance of the August 1-2 talks, however, is that they will establish the link, if any, between the Cancun conference and the continuing talks in the United Nations and other forums on perennial development questions. The developing nations, for example, would like to see Cancun give immediate impetus to the so-called global round of negotiations between the rich and poor countries at the United Nations, while the United States and Britain want to avoid taking positions in October that would imply concessions in the global talks at the UN.

As in the past, the entire debate about relations between industrialised and developing nations is being ignored by the developed countries of the Soviet bloc, which insist that only the "imperialist" powers are responsible for the backwardness of their former colonies. The Soviet Union therefore refused to attend. China accepted the invitation. But the principal political squabble surrounding preparations for Cancun involved Cuba, which, as current chairman of the non-aligned nations, insisted on its right to participate. But the 11-nation committee organising the conference eventually went along with the United States and did not invite Cuban President Fidel Castro.

Though the US stance towards Third World has softened, it does not mean there is change of heart as far as the United States is concerned. It seems only under heavy pressure from its allies and to please Mexico—an important supplier of oil to the US—did Mr Reagan ever consent to the use of the term "global negotiations" in Ottawa communique—and then as if it was written in lower case.

How President Reagan will react at Cancun is another question. When Mr Haig arrived at the swank Cancun Sheraton Hotel to attend the preparatory August 1-2 meeting, his mission was to keep the summit procedures as informal as possible in the hope of preventing the meeting from turning into an anti-US forum. "We made it clear to Lopez Portillo that we did not want a negotiating session or a communique," said a senior American planner. "The summit is going to be very different from what the developing countries and some of the sponsors want." Ronald Reagan is guaranteeing only to show up in Cancun and to listen.

President Reagan's formula for rescuing the developing nations is rather limited. He believes that, like South Korea and Taiwan, they can arrange their own prosperity, if they adopt the right policies and if the industrial world returns to economic health. Rather than a North-South dialogue, Mr Reagan would prefer bilateral deals, and his ideal solutions do not involve the government at all. "Quite often, the private sector can accomplish what the public sector cannot do efficiently," says Myer Rashish, US Under Secretary of State for Economic Affairs. "The Administration will be looking for new ways of making it attractive for American business to be involved in the development of poor nations."

Thus, the Reagan formula conflicts with the allies' grandeur plans for pumping up the Third World. Due to these sharp differences in the viewpoints, experts see little headway being made in the coming North-South summit dialogue. Yet it is heartening for the developing nations that the United States under Reagan Administration—which was hitherto skeptical to negative about the "global negotiations"—has atleast agreed to participate in the UN forum for "global discussions" on world economy.

Spokesmen for developing nations said they did not expect any binding agreements to come out of the North-South summit, though they did expect participants to come to a general understanding of what needed to be done.

EDITOR'S NOTEBOOK

Vadilal Dagli

THAT the so-called leaders of Indian medical profession, and particularly the Indian Medical Council are basically against the spread of medical facilities in India was again highlighted by a fantastic speech which Dr A. K. N. Sinha made in Bombay recently. Unfortunately Dr Sinha is the president-elect of the World Medical Association. If persons like Dr Sinha would speak for India and perhaps for the Third World, it would be a sad reflection on the quality of compassion of medical profession of this country. Inaugurating the first all-India convention of junior doctors on August 8 Dr Sinha said that during the last 30 years many medical colleges had sprung up without the creation of job opportunities for the young doctors. He also said that if government offered decent emoluments and other facilities, many doctors would be willing to serve rural areas with dedication. Were there enough doctors in the country so that the mobility of medical manpower could be ensured? Dr Sinha said that the number of medical colleges had risen from 23 in 1947 to 112 today. According to him, this was a sad development because it created "a large scale unemployment".

If the rural areas are without medical facilities, if even suburbs of many metropolitan cities are without medical facilities, why should there be unemployment among doctors? Despite massive investments in medical education and in the construction of hospitals, the fact remains that today in our country there are only 1.6 hospitals for 1,000 sq kilometres of area and there are only 79 hospital beds per lakh of population. This is an all-India average. In some states like Jammu and Kashmir, Karnataka, Gujarat, Assam, Bihar and Rajasthan, the situation is worse than what is indicated by the all-India average. Incidentally, when the Government of Gujarat wanted to set up more medical colleges in Gujarat, the medical profession's cartel, which is pompously called Indian Medical Council, had expressed the view that there were enough medical colleges in Gujarat. Can you imagine a situation in a state, which is relatively developed, that it has only one hospital per 1000 sq kilometre area and the government would not permit to set up medical colleges because an anti-people organisation like the Indian Medical Council would not allow it.

Dr Sinha also spoke against the short-term course for the doctors who are called 'bare-foot doctors'. Now at a time when you have absolutely no medical facility in lakhs of villages, to provide minimum medical facilities is considered something objectionable by the Indian Medical Council which forgets the fact that for decades we had LCPS doctors who were as reliable doctors as M.B.B.S. doctors. The managing director of the *Times of India* group of papers, Dr Ram Tarneja, who is a well-known management expert, also spoke at this meeting. He emphasised the point that the society is spending a huge sum on medical education of a doctor. (As a matter of fact the government spends as much as Rs 3.3 lakhs to train one doctor). So the doctors have a social responsibilty of assisting the society to spread medical facilities to rural areas. One can understand the demand for giving more facilities to doctors. But to say that we have more doctors is just to tell a lie. Today we have only one doctor for 2,600 persons. This is why what is required is the extension of medical facilities to those people who are also citizens of India. The time has arrived to consider whether the MRTP (Monopolies and Restrictive Trade Practices) Act should not be applied to medical profession which has become a powerful cartel.

★

JEWS suffered the holocaust of Hitler as no race has suffered in human history. It was, therefore, appropriate that after the World War II the Jews got their own State Israel. The State of Israel is the land of the brave people. It is surrounded by hostile Arab countries. But unfortunately Israel is behaving in the same manner as Hitler was treating the Jews. Recently Israel bombed Arab strongholds in Lebanon. Before that it bombed a nuclear power plant of Iraq on the plea that Iraq was making a nuclear bomb. But the recent authoritative announcement from the French who were helping build the nuclear power plant in Iraq has recalled that there was no atomic bomb factory in Iraq. Following the recent attack on Palestinian refugees (who were driven by Israeli from their homeland) Israeli bombs killed 300 persons and wounded 800. So Israel's Prime Minister Menachem Begin, has emerged as a *goonda* of West Asia who has been armed to the teeth by the United States. But the American Government is also getting disillusioned with Israel. It has suspended sale of F-16 fighters and the Defence Secretary is espousing a 'get tough' approach towards Israel. Recently even the usually friendly *Washington Post* published an article on Israeli behaviour which was exasperately entitled "Madman for an Ally". The article by William Raspberry says: "Begin's latest adventurism may be his most dangerous—for Israel. The signs are everywhere that the American people are growing tired of supporting a bully ..The question of what Begin hopes to accomplish by his newest adventures is, so far as US policy is concerned, largely irrelevant. The fact is that America has a madman for an ally."

★

THE life and death of Bhupesh Gupta should provide an opportunity for reassessment of the theory of the dictatorship of the proletariat (which in effect means plutocracy by the Politbureau). This is the philosohy of the Communist Party of India and other totalitarian parties preach. Bhupesh Gupta who died in Moscow at the age of 66 on August 6, was a great parliamentarian and a public servant. The way he used parliamentary democracy to further the cause of the underprivileged should convince the communists that in the ultimate analysis social justice can be best achieved through a flowering of plural society. Communists in Italy and Spain have accepted this fact and rejected Stalinist idea of monolithic state where opposition leaders are always in prison. Bhupesh Gupta was both a prison bird and a parliamentary bird. He would be remembered as one of the builders of parliamentary democracy in this country. His great contribution was his courage. While remaining within the discipline of the Communist Party, he followed the path of his conscience and he had only one conscience—social conscience. The fact that all political parties paid spontaneous and full-throated tribute to Bhupesh Gupta would indicate that he lived a life which was far from sectarian.

Special Reports

In search of new sources of energy

From PAVAN SHARMA

NAIROBI

A UNITED Nations conference which is expected to give impetus to the search for new and renewable sources of energy before the oil reserves run out opened here, on August 10, in the presence of 4,000 distinguished statesmen, scientists and other delegates. The conference will last until August 21.

The Indian Prime Minister, Mrs Indira Gandhi, who spoke immediately after the Kenyan President, Mr Daniel Arap Moi, inaugurated the conference, called for a world policy to ensure equitable distribution of conventional energies and joint development of new and renewable sources. She suggested the setting up of an international consortium to mobilise bilateral credit and aid for monitoring the international energy programme.

Both Mrs Gandhi, in her keynote address, and President Daniel Arap Moi asked the affluent countries to end the reckless use of fossil fuels and accept the responsibility of helping poor countries get the energy they need to develop. Mrs Gandhi said that energy should become a focal point of contemporary international co-operation to facilitate joint development of new and renewable energy such as solar power, wind, water and bio-mass consumption.

According to a UN source, the meeting is being convened under a 1978 General Assembly resolution which stressed the plight of developing countries, most of which import oil. During 1980 Third World oil importers ran up a payments deficit of around 50 billion dollars. So, the world community has turned its attention to the energy crisis and to look for alternatives to fossil fuels ranging from hydro-electricity to cow dung.

As in other UN gatherings, the Third World countries are expected to seek infusion of capital and technical assistance. With the help of expert studies, the conference intends to examine all alternative energy sources and their possible use. While a general debate is in progress, two committees will try to work out a programme for international action.

Some of the alternative forms of energy are still being developed while others are to be discussed. Among the former are methods of harnessing the energy of the oceans, converting solar radiation into electric current, and extracting fuel from oil shale and tar sands. Historic sources that will be re-examined include wind power and the humble draft animal. Some two billion people in the developing countries still depend for their livelihood on mules, donkeys, bullocks, elephants and camels.

Animal manure, with other farm wastes such as wheat and rice straw, meanwhile can be fed into converters to yield methane gas and other biomass fuels. The conference will consider these, noting the drawback that, in some societies, the use of human or pig excrement is socially unacceptable.

Experts expect that the conference will pay special attention to the burning of wood, still used to cook the food and heat the homes of half the world's population. This has been called "the second energy crisis". More than 100 million people now live in areas where basic wood fuel is running out because of the rate at which forests have been cut down. One billion others can meet their energy needs only by using up their wood reserves faster than they can be regenerated.

The conference will examine hydropower, a renewable energy source that already generates some 23 per cent of the world's electricity, and the exploitation of geothermal energy generated by the flow of heat from earth's core. New and renewable energy sources at present contribute about 15 per cent of the world's total energy supply.

Energy forecasters argue that if developing countries are to achieve even modest economic goals, their energy requirements will rise threefold in the next 20 years, suggesting that new and renewable energy sources will be called upon to meet 25 per cent of expanded world demand by the end of the century.

Mr Enrique V. Iglesias, the Uruguayan economist, who is secretary-general of the UN Conference, says the Nairobi meeting represents a momentous step, because it is the first concerted global effort to plan a rational energy future for the world. He wrote recently: "If we can alert public opinion to the gravity of the energy problems of the developing countries (for example, the severity of the fuel-wood crisis) and thereby create a climate of political will for change, we will be moving in the right direction."

Kenya is the only African country which is participating in the *Energy* 81 exhibition on the premises of the Kenyatta International Conference Centre in Nairobi. Performing the opening ceremony of the exhibition as part of the UN Conference on new and renewable sources of energy, Kenya's Energy Minister, Mr John Okwanyo, observed the developing countries had found it difficult to cope with the situation arising out of escalating oil prices. He said the oil price hikes resulted from a realisation that oil was a finite resource which would be exhausted one day, adding that the decision to increase oil prices had had disastrous effects on the developing world.

The international community was shocked to realise that the era of cheap oil energy was over, and that time had come to look for alternative sources, he said. The exhibition offered a unique opportunity to learn about the most modern equipment and on the latest technological developments on new and renewable sources of energy. Inviting visitors to tour the Kenya stand, which he said, was the only stand by an African country, Mr Okwanyo added that the stand would display in expensive simple cooking stoves and other items.

The energy exhibition will last until August 31. It has been organised by the United Nations Secretariat and the Kenya Ministry of Energy. About 20 countries and agencies are taking part. India has reserved three stands for the display of her technological progress since independence.

The four Prime Ministers attending the conference are: Mrs Indira Gandhi of India, Mr Thorbjorn Falldin of Sweden, Mr Pierre Trudeau of Canada, and Mr Edward P. G. Seaga of Jamaica.

In honour of the visiting Prime Minister, the Indian High Commissioner. Mr V. K. Grover hosted a party at his residence in Nairobi on August 9. A large number of Indian nationals was present on the occasion.

According to Mr R M. Roy, press attache of the Indian High Commission, the international preparatory committee for the UN Conference on new and renewable sources of energy started its final meeting on August 3. The Group of 77 had separate prior discussions followed by the plenary of the whole committee. Working groups were set up by both the Group of 77 and the plenary to discuss different parts of the draft programme of action to be adopted by the conference. The Indian delegation to the preparatory committee was led by Mr Maheshwar Dayal, Secretary, Commission for Additional Sources of Energy and included Mr S. V. Purushottam, deputy permanent representative of India to the UN.

FICCI's export plan

NEW DELHI

THE Federation of Indian Chamber of Commerce and Industry (FICCI), has submitted an export plan for 1981-82 to the Government. It is problematical how far it would receive serious consideration. A meaningful government-business dialogue has failed to develop, which remains an obstacle to the formulation of proper policy. It is a measure of how little confidence the FICCI has that its plan would make any material difference to official thinking that it should have submitted it four months late. Last year also an export plan was submitted but, according to the FICCI itself, "many measures suggested remained unimplemented." The FICCI visualises exports of Rs 8,600 crores in 1981-82, which would mean an increase of nearly 23 per cent over the last year's figure of Rs 7,100 crores, whereas the Government has pegged the target at Rs 8,400 crores. But there is scepticism in government circles whether a target of even Rs 8,400 crores would be attained because of "adverse international conditions".

Widening of the trade gap from Rs 1,088 crores in 1978-79 to Rs 2,449 crores in 1979-80 to Rs 5,400 crores in 1980-81 makes the need to boost exports an automatic policy imperative. From the statistical picture given by the Commerce Minister at his recent press conference it would seem that exports have begun to pick up. In April-May this year export earnings were Rs 1,610 crores compared to Rs 837 crores in the corresponding period of last year, showing an increase of 20 per cent.

Perhaps the various measures taken by the Government are beginning to yield results. Nonetheless the overall position remains far from satisfactory. For one thing, a certain part of the improvement in export earnings is attributable to inflation and not quantitative growth. Nothing illustrates this better than the fact that India's share of world exports not only remains miniscule but has continued to decline, being 0.72 per cent in 1970 and 0.36 per cent in 1980. This brings us to the fundamental proposition that, in the ultimate analysis, the capacity to export depends on the capacity to produce. The truism has received due emphasis in the Tandon Committee report on export strategy and constitutes the base of the recommendations contained in the FICCI plan.

The FICCI's recommendations that measures should be taken to ensure availability of raw materials and essential inputs, improve infrastructural facilities, harmonise industrial relations and expand and modernise production capacity collectively are tantamount to an exhortation to give stimulus to production. To go a step further, it is possible to assert that to the extent the country continues to be saddled with economic policies that impede rapid economic growth the drive to boost exports can only succeed within pre-ordained limits.

The FICCI plan also, of course, contains recommendations having a direct bearing on exports. These include concessional railway freight rates for export goods, tax support in the form of a rebate on export earnings and an additional cash compensatory support for promotion of new products and exploration of new markets. Also stressed is the need to build a sound export infrastructure in the shape of proper port and shipping facilities and international air cargo terminals at important airports. This is unexceptionable. But recommendations seeking further financial concessions require careful examination.

As it is, the policy of subsidising exports is not entirely free from controversy. The ever increasing burden of exports subsidy and revelations of abuse have led to suggestions that there should be a cost-benefit analysis of the entire scheme. The Sixth Plan itself calls for pruning of subsidies, if not their elimination. A recent report of the Comptroller and Auditor-General cites several instances where the foreign exchange earning has been less than the expenditure on subsidisation. A minute of dissent attached to the Tandon Committee report has strongly questioned the effectiveness of the incentives scheme. Further, an element of *ad hocism* in decisions concerning concessions has detracted from the stability of export policy. However, if Indian exports have to increase in the face of stiff competition, there is no alternative to the scheme of subsidies, especially when several of our competitors provide a similar financial crutch to their exporters. What perhaps is needed is a review and rationalisation of the subsidies structure and better monitoring of the concessions given.

The FICCI export plan considers that the following items would be the major contributors to export growth in 1981-82: engineering goods including capital goods and project exports, gems and jewellery, garments, wool and woollen goods including carpets, chemical products including basic chemicals and pharmaceuticals, marine produts, oil cakes, sports goods and spices. Legislation to establish the *EXIM* bank to boost project exports is to be introduced in the monsoon session of Parliament. If the bank could act as a catalyst in inducing Indian construction companies to adopt the consortium approach, it will have gone a long way in enabling them to bag contracts in West Asia in the face of competition from western giants.

As far as exports of our traditional foreign exchange earners like tea, cotton textiles and jute manufactures are concerned, the FICCI believes that these would rise only marginally owing to an unfavourable international market situation and emergence of new suppliers including China. However, for FICCI to suggest that this year fruits, vegetables and processed food products should be exported to the tune of Rs 1,000 crores is symptomatic of the one-sidedness the businessmen's organisation often betrays in its thinking.

The FICCI's pet demand for restructuring the tax system so as to minimise the cascading effect of various levies and introduction of the value added tax pattern finds, of course, a prominent place in the plan. The suggestion that a joint team of the Government and the FICCI should study the exports apparatus of South Korea and Taiwan can only do good provided one difference is kept in view. Those are tiny, export-based economies which continental India, with the vastness of her domestic demand, can never be. In fact, the FICCI has done well to remind the Government of the importance of import substitution by pointing out that Rs 2,000 crores should be saved in foreign exchange by acquiring self-sufficiency in items like cement, caustic soda, fertilisers, paper and edible oils. Alleviation of difficulties faced by exporters on account of a labyrinthine over-regulated system is a promise, which the Government must now translate from theory into practice. If India fails to surge forward on the export front, it would only be indicative of deficiency in the making of policy and its implementation.

US foundation for African Policy

By A SPECIAL CORRESPONDENT

IN assessing American interest in Africa south of the equator, it is good to remember that the United States has with South Africa less than one per cent of its total foreign trade. Of the total foreign investment, an overwhelming contribution has come from Britain. In fact, South Africa has so far been able to attract the insignificant outlay of less than one per cent of the total overseas investment of the United States. Also it currently imports nearly two-fifths of its oil requirements from Black Africa. There is, therefore, no question where America's economic ties and interests lie.

Nor has there been any doubt, since Mr Reagan's men came to power in Washington, of his political support for the minority white regime in South Africa. It may be a hasty and unwarranted conjecture to conclude that South Africa also has the blessings of Mr Reagan in its efforts to destabilise African governments, as in Angola. But its massive industrial growth in the past decade, a strong balance of external accounts thanks to the boom in gold prices (a thing of the past now), and a strategic position along the shores of Atlantic and Indian Oceans have gone a long way in commending South Africa as a worthwhile ally to the great powers. Obviously, its manifestly pro-West and anti-Communist orientation has attracted President Reagan.

A further temptation lies in American concern about access to the mineral wealth of South Africa-occupied Namibia. Latterly, the United States has blessed South Africa's desire to undermine the implementation of the UN Security Council resolution on Namibia's independence. In this it has not hesitated to give up the common ground reached after long negotiations by the Western Contact Group consisting not merely of Britain, France, West Germany and Canada, but also of the United States. Mr Reagan's second thoughts have thus put in jeopardy all the agreed steps in Namibia—disarming of guerrillas, establishment of demilitarized zones, return of Namibian refugees from Angola, withdrawal of *UNITA* forces armed by South Africa, and a free and fair poll under credible international auspices.

When in Angola last April the Assistant Secretary of State for African Affairs, Mr Chester Crocker, tried to substitute the Security Council resolution by what is now known as Mr Reagan's Linkage Plan, he pressed for withdrawal from Angola of Cuban troops who incidentally ensure the security of oilfields of direct and indirect interest to the United States. He wanted the Angolan Government to include representatives of the opposition *UNITA* Party. If Angola accepted these con-

ditions, the US would establish diplomatic relations with Angola. It was indeed a pity the irony was lost on Mr Crocker of communist and Cuban troops guarding Gulf oils Angolan operations!

Angola rejects this move to link Namibian independence with South African presence and armed incursions. Resenting interference in its internal affairs, the Angolan Government told Mr Crocker that there were no foreign troops on its soil when it became independent. They were invited only after some 6,000 South African troops entered Angola six years ago to stem the nationalist tide. Also the United States—"which has its troops in every continent in the world"—has no moral right to make such a demand. Angola has also been naturally concerned over the possible repeal of the 1976 Clark Amendment which would leave the American Administration free to give covert military support to the anti-government forces in Angola.

That Reagan's Linkage Plan does not find favour with all American allies has been known for some time. There is now enough proof that within the United States too the South African policy is opposed in many quarters. One of the weightiest pronouncements of a new policy on South Africa comes from the University of California press. It has just published the *Report of the Study Commission on US Policy Towards South Africa*. What gives significance to the report is not just the fact that the Commission was headed by the president of the Ford Foundation, Mr Franklin A. Thomas. Its strength lies in its utter reasonableness.

The report points out how US contacts and involvements in Africa must add up over time to a credible policy. Towards the evolution of this policy frame, the Commission lays down clear guidelines. The long-term emphasis of American policy has to be, according to the Commission, developing the industrial and mineral resources of *all countries* in the southern half of Africa. This will release the United States of dependence for import of strategic materials from South Africa and Namibia. In the short run, the report adds, the essential minerals should be stockpiled. At the same time American firms in South Africa should "not expand". Others contemplating investment in South Africa should "stay out" for the present. The American firms operating in South Africa have been asked to encourage Black leadership and work for labour welfare. By improving wages and living conditions and by adopting power-sharing procedures, they should help the emergence of responsible trade unions.

At the more political level the report is both bold and innovative. In relations with South Africa it suggests resort to pressures and influences directed towards liberalisation. The long-term aim for American policy should be to enable the Africans and coloured populations to share political power with the White minority. The report comes out emphatically in support of organisations outside South Africa which work for a change in its apartheid policy. It suggests concrete help to Black leaders and to other agencies—the World Council of Churches, for instance—which seek to restore human rights and dignity to the Africans. Most important of all is the suggestion that the American Government and people must openly declare how opposed they are to apartheid.

The Ford Foundation report could not have come at a more opportune moment. Its power lies in the power of ideas. The Reagan Administration may not yet withdraw aid and comfort from the South African Government. But the report must give heart not merely to the anti-apartheid forces in South Africa but also to the front-line African nations and to liberal opinion the world over.

In getting this report prepared the Ford Foundation seems to stand out on the side of the angels, but with its feet on the ground and not floating off into the clouds. It gives an agenda for concerted action step by step, without ignoring the inter-relationships with wider issues. In seeking to find answers to pressing difficulties of today, it does not forget the historical context of yesterday.

Steel modernisation programme

From P. C. MAHANTI

CALCUTTA

IN the course of a recent visit to Calcutta, the chairman of the Steel Authority of India, Mr K. C. Khanna, made a heartwarming statement on his organisation's plan for investment in the steel sector in West Bengal. If the plans go through then some Rs 1,100 crores to Rs 1,200 crores would be invested in the three major public sector steel undertakings, namely Durgapur Steel Plant, the Alloy Steels Plant at Durgapur, and the Indian Iron and Steel Company, in the course of the next four to five years.

The lion's share of the proposed investment will go to Durgapur plant for which the British Steel Corporation has prepared a modernisation report. The plant badly needs for it is over 20 years old now but the Steel Authority Board feels that there should be some tonnage expansion along with the modernisation of the existing equipment also to enhance the plant's ability and to make more steel available to the economy at a cheaper capital cost. This is a sound proposition which ought to appeal to the Government of India, the Ministry of Steel precisely, and the Public Investment Board which will have to clear the investment needed for the plan.

The project to expand the capacity at the Alloy Steel Plant from the present 60,000-tonne capacity to one of 90,000 tonnes per year has already been cleared by the Public Investment Board. So work on this expansion project is likely to start soon. In terms of size and investment, Rs 60 crores may not look big but it will lead to a more diversified product-mix which should increase its profitability and, at the same time, make available to the economy types of special steel that are often in short supply and have, therefore, to be imported. Incidentally there is a possibility that the present executive managing director of Durgapur Steel, Mr N. K. Mitra, goes over to Bhilai to take charge from E. R. C. Sekhar, who is going away to Nigeria on a lucrative assignment on that country's steel project. Incidentally Mr Sekhar's migration represents another page of brain drain which has been taking place in the steel industry. First of all it was P. L. Agarwal, a SAIL chairman, to Indonesia, then K. C. Mohan of MECON to West Asia followed by many others not so well-known.

The third major steel project chosen by the Steel Authority of India for substantial new investment is the Indian Iron and Steel Company, the country's second oldest plant and the oldest in West Bengal. Once the pride of Bengali entrepreneurship it is now a state-owned undertaking but still a sick one. As per plans already approved a sintering plant and ancillaries, at a total cost of Rs 60 crores, will be set up during the next three to four years to improve the operational efficiency of the plant. But the SAIL chairman feels that the time has come to consider whether this plant too should not be expanded to a modern, more economic capacity of two million tonnes. Accordingly, he has invited Gipromez of Russia to send a team of experts to study the present conditions of the plant and make recommendations about the lines on which the plant can be expanded and diversified. The French once showed interest but the interest was not so serious and unlike Gipromez there would have been no financial backing from the French side.

Tata Steel's modernisation programme has started in right earnest. This Rs 200-crore time-bound programme is meant to modernise the company's steel melting equipment and a part of the rolling equipment as well through the continuous casting process. Some 200,000 tonnes of extra steel capacity will result from the programme which is to be completed in nearly 30 months' time. A second phase of the modernisation programme will take place in the rolling mills and there will be a further measure of diversification of the product-mix.

Big potential for nucleonic gauges

BOMBAY

INDIA today has a comprehensive programme of radioisotope applications and occupies a leading position in the world. A close interaction between R & D centres, the electronics industry and users is essential for catching up with the advanced countries in the field of nuclear instrumentation technology, according to Dr V. K. Iya, director, Isotope Group, Bhabha Atomic Research Centre (BARC).

Delivering the presidential address at a seminar on nucleonic weigh feeders organised by ACC-ECIL here, he said BARC had played a pivotal role in the growth of isotope radiography by providing the equipment and radiation sources necessary for this work along with a comprehensive training programme in radiogaphy techniques. The country which had two radiography cameras in 1957, now had 1,000 cameras. Most modern Indian industries—all the major fertiliser factories, oil refineries, thermal and nuclear power stations, electrical and heavy machinery industries and defence establishments today used isotope radiography techniques. These have brought spectacular savings to user industries.

Radioisotope techniques offer high sensitivity, and selectivity in detection and are suited for studying leaks in buried pipelines and system kinetics in process industries. For instance, tracer techniques used in sediment transport in almost all the major ports of the Indian coastline have contributed to substantial savings in our capital dredging programmes and in harbour and port designs. A recent application of tracer techniques has been in establishing leaks in the buried crude oil pipe line between Koyali and Viramgam. Radioisotope tracers are also now in regular use in the blast furnaces of our steel industry to indicate the wear of refractory linings, plan relining operations in advance and prevent unscheduled shut-down of these furnaces.

Perhaps the most important economic benefit of the application of radioisotope techniques is in the area of nucleonic gauging for process control. Nucleonic gauges can be used for determination and control of the level, thickness, density, concentration and other parameters of materials in industrial processes. There are about 1,000 nucleonic gauges installed in the country today, but most of these are simple level control devices. The potential for application of this technology is enormous.

Mr S. R. Vijaykar, managing director, ECIL, said, industries in India should employ sophisticated systems of electronics to improve output, raise quality and bring down production costs. Mr Vijaykar, who inaugurated the seminar, said we had the scientific and technical wherewithal to ensure safety in the use of nucleonic devices.

Mr T. V. Balan, ACC's director, in his introductory observations, spoke of the satisfactory working of nucleonic weigh feeders which are in extensive use in ACC factories, and other leading plants in the country.

UTTAR PRADESH

Low level of investment in industry

LUCKNOW

LACK of adequate infrastructure facilities, shortage of power and delayed supply of critical raw materials have impeded the industrial growth of Uttar Pradesh. The main reasons for the industrial backwardness of the State have been the low level of investment in the Central and State sectors and inadequate incentives for attracting investment from other States.

Broadly, under-utilisation of installed capacity may be attributed to demand constraint, supply constraint and sickness of units. Capacity utilisation of selected industries under large and medium sector (on the basis of DGTD-MLS) is indicated in Table 1.

Table I : Capacity utilisation of selected industries:

Industries	% capacity utilisation in 1979	
	UP	India
I	2	3
Aluminium	82.0	69.3
Nitrogeneous fertilizer	68.9	69.2
Leather footwear ..	22.9	55.3
Cement	54.2	81.2
Pesticides	102.0	90.6
Soap	197.1	134.5
Baby food	69.6	91.0
Bycycles	59.3	105.3
Dry cells	18.5	66.5
Paper and paper board	68.3	76.1

Village and small industries, which play a significant role in providing more employment, suffer from different bottlenecks/difficulties which are now being sought to be removed. Lack of entrepreneurship and inadequate infrastructure are the major constraints for the growth and development of small scale industries.

In 1972-73 there were only 12,851 small scale units. By 1979-80, their number rose to 43,159. Besides this, the number of small scale units registered under the Factories Act also rose to 4,284 in 1978 from 3,431 in 1970. Authentic data on small scale industries in the unorganised sector are not readily available. This has been the major constraint in the projection of growth of small scale industries. However, it is estimated that the number of such units was 3,107 in

1960-61, which has now increased to 44,443, providing employment to 5,38,000 people in the State and producing goods worth about Rs 980 crores a year.

The development of small scale industries in this most populous State of the country has been slower than in some other State. According to a study made by the Awadh Chamber of Commerce, about 40 per cent of small scale units are sick. There has been a complaint from small industry that canalising agencies like STC, MMTC, SAIL, TEEDC, UPSIC, etc at times do not supply material in a phased manner but are asking the units whose financial resources are limited to lift the material in a single lot.

Briefly, the problems being faced by the small units in getting raw materials from the canalising agencies are : late delivery of material, non-supply of material of required specifications, underweight in different godowns of canalising agencies, creation of cartels of foreign suppliers, wide gap between the prices of indigenously available raw materials and imported by canalising agencies, difficulties of small units due to lack of sales depots/sales agencies of the canalising agencies in the State etc.

Small scale units have been facing acute shortages of raw materials like iron and steel, pig iron, cement, chemicals, mutton tallow, wool, hide and skin, oxygen, furnace oil, dyestuffs etc. According to the spokesman of the Awadh Chamber of Commerce, the main reason for the non-availability of the raw material is that the distribution system from the Centre to the State does not conform to any uniformly applied formula.

The Chamber's study has revealed that although the import of raw material has been increased, the small units have not been getting a share in the foreign exchange as per its contribution in exports. Further, the small sector receives its allocation on value basis and not on quantity basis as a result of which the quantity of raw material available to a unit has been reduced considerably.

No firm figure about the closure of small units due to non-availability of raw material and frequent power cuts are available, but the Chamber's assessment of the situation is that at least 20 per cent of the existing units are on the verge of closure.

Though the State has now started contributing about 20 per cent of the country's total production of khadi and village industries, the Commission's activities in hill, border, tribal and weaker section areas, which are more or less carried out departmentally, have been on a low scale, particularly from the viewpoint of enlarging employment in these areas.

TATA 1312/46— the 13-tonne vehicle for the eighties that exceeded even the operator's expectations!

- * All-round sturdy design with highly fuel efficient 695 DI Engine
- * Higher Payload
- * Lower Life-cycle Cost
- * Increased Safety
- * Greater Profitability

New, longer-lasting, high-power 695 DI Engine

The efficiency of the new 695 DI Engine not only reduces fuel consumption; it also offers extra power and reduces operating costs.

Bearing up well to the extra load

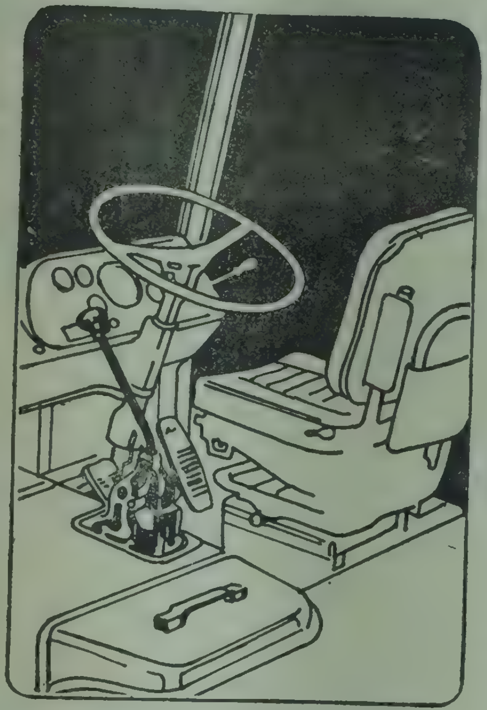
A new, sturdier front axle with heavy-duty bearings, a reinforced Banjo-type rear axle and reinforced suspension take the jolts and bumps of rough roads, and the stress and strain of heavy loads —in their stride.

A carrier assembly on the rear axle makes for ease of maintenance.

The TATA 1312 rides on 10.00 x 20 16-Ply rating Nylon tyres that are more suitable for carrying heavy loads. And what's more, even if you build a sleeper cab—you get a loading platform that is almost 6.15 mtrs. in length.

Effortless gear-changing

The proven TATA synchromesh GBS-40 Gear Box, with a conveniently placed gear-shift lever, a favourite of operators, eliminates the tiresome double-declutching of a claw-type gear box.



More safety on wheels

The TATA 1312 has a Tandem Master Cylinder with independent circuits for front and rear axle brakes. In the unlikely event of brakes failing on any one axle, it ensures that the brakes on the other axle will work surely and effectively. Wider, thicker brake linings resist wear, last longer.

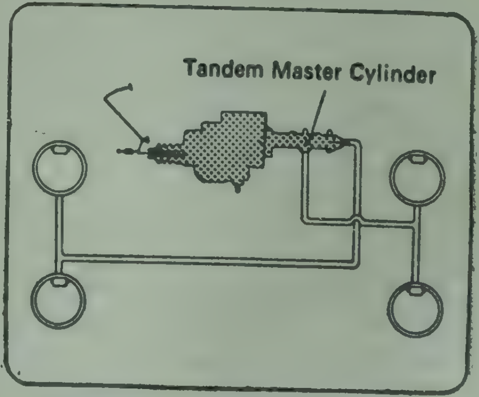
The fail-safe and parking brake systems ensure that rear brakes get applied automatically in case of failure in the air system. While parking on steep gradients, the spring-actuated fail-safe and parking brake provides greater holding capacity.

Lower life-cycle cost

The sturdier, longer-lasting components, the highly fuel-efficient engine and the increased load-carrying capacity of the TATA 1312—all add up to lower overall life-cycle cost and greater profitability for you.

All good reasons to opt for the TATA 1312... and some more

Each component of the TATA 1312 has been carefully designed for maximum efficiency. There's also the reassurance of back-up service and ready availability of genuine Telco Spares whenever and wherever you need them from Telco's dealer network of over 147 sales and service centres countrywide.



In whatever way you add up the sum of its parts, the new TATA 1312 results in greater profitability. And isn't that what you're in the transport business for?

Need for metals buffer stock

BOMBAY

INDIA needs to maintain a buffer stock of basic non-ferrous metals because the gap between indigenous demand and supply is large and it has to import most of its requirements. Mr Surendra N. Parikh, president of the Bombay Metal Exchange Limited, asked therefore Mr Daya Dhaon, chairman of MMTC, to form a metal bank in the country to ensure steady supplies of metals. He was speaking at the silver jubilee function of the Bombay Metal Exchange. He said, the responsibility for saving precious foreign exchange lay with Hindustan Copper Limited and Hindustan Zinc Limited, which should meet their targeted plans.

Today, Hindustan Zinc Limited meets 45 per cent of the country's demand for zinc metal and 25 per cent of demand for lead metal. By 1989-90 it will meet almost 90 per cent of the country's demand for zinc and 75-80 per cent of its demand for primary lead.

Describing production and consumption trends of zinc and lead in India, Mr R. P. Kapur, chairman of Hindustan Zinc Limited said, zinc demand which was 68,000 tonnes in 1970-71 and 106,000 tonnes in 1979-80 would reach 185,000 tonnes in 1989-90. On the production side, installed capacity had increased from 30-35,000 tonnes in 1970 to 90,000 tonnes in 1980. To meet increased demand, HZL was bringing another smelter into production in western India with a capacity of 100,000 tonnes per annum.

Primary lead consumption in India increased from 18,000 tonnes in 1970-71 to 41,000 tonnes in 1979-80 and would reach 75,000 tonnes per annum by 1989-90. Production of primary lead in India had increased from 3,500 tonnes per annum in 1970-71 to 15,000 tonnes per annum in 1980-81 and would reach 27,000 tonnes per annum by 1984-85.

While Mr Kapur was optimistic that India would achieve self-sufficiency in zinc concentrates and metal production in the next six to seven years, Mr O. P. Vasudeva, chairman and managing director of Hindustan Copper Limited, did not feel that self-reliance in copper was possible in the near future. India has known copper reserves of 415 million tonnes with a copper content of 1 per cent. If we start exploiting these reserves today, our deposits will last for 50 years. If we try to meet increased demand from the reserves, we will exhaust the deposits in 25 years, Mr Vasudeva said.

Mr Kapur also described international trends in zinc and lead production and consumption. The per capita zinc consumption of industrialised countries like the US, Japan, West Germany and the UK at present was 5.9 kg, 5.2 kg, 5.8 kg and 5.0 kg, respectively. In contrast India's consumption was a mere 0.15 kg.

Zinc smelting capacities which grew near consumption centres in industrialised countries like the US, Western Europe and Japan are now shifting to less industrialised countries which produce concentrate such as Peru, Mexico, Australia, Canada, India and Brazil.

The prices of non-ferrous metals, mainly zinc, copper and aluminium, have been uneconomic for the past decade. Lead has fared better. Price trends in non-ferrous metals have been influenced by the distortions caused to the world economy by the 1973 oil crisis. Further distortions in prices have resulted from the differing strength of currencies in Europe and Japan, which are major producing and consuming areas.

Chemicals: Indiscriminate import policy

CALCUTTA

JUDGING from the presidential speech of Mr B. V. Nagori at the recent meeting of the Indian Chemical Merchants and Manufacturers Association, the chemical industry in the country presents a mixed picture. In some areas, it is quite depressed, in some, rather bright. For example,, the production of caustic soda, potassium chlorate and red phosphorus was higher in 1980-81 than in the previous year. On the other hand, the output of calcium carbide, carbon black, soda ash, technical pesticides and nitrogenous fertilisers was lower than in the previous year. The capacity utilisation in the industry as a whole was 50 per cent which means that the capacity utilisation in the depressed sectors was particularly low.

While the sluggish condition of the economy has been the main cause of the chemical industry's cheerless picture, the government's indiscriminate import policy also has a lot to do with the chemical manufacturers' current difficulties. The dyestuffs industry is a case in point. The government's policy to license dyestuffs imports liberally has been badly hurting the indigenous producers. The much-needed growth of the industry, especially in the eastern region, has also been checked. Yet another of example of how thoughtless taxation policy by raw material producing states can damage the interests of an important segment of the chemical industry is provided by the UP Government which has enhanced excise pass fee on alcohol by as much as 400 per cent. This is definitely adding to production costs in an industry that is already beset by serious financial problems. Apart from the high rate of excise duty, there is a great shortage of this raw material in West Bengal leading to the shut-down of the Alkali and Chemical Corporation's Rishra low density polythylene plant.

Mr Nagori's speech also contained references to the chemical industry's poor growth in the eastern region. To West Bengal's problems in diversifying its economy, his references were elaborate. Much is expected from the proposed Haldia petrochemical complex and the downstream units that would follow in normal course, but the complex is still far from materialising. At least, 100 projects downstream in medium, small and large sectors could materialise which would not only generate considerable employment but also give a significant boost to the economy of West Bengal and the eastern region as a whole. For this the Centre is being consistently blamed by the State Government, but the Ministry itself is responsible for causing a major upset in the state's small-scale drugs and pharmaceutical industry. The State Government apparently wants to cut down drastically purchases from these units for the Employees' State Insurance Scheme. These units with an annual turnover of Rs 15 crores and a labour force of about 3,000, are dependent on government purchases of the extent of 80 per cent of their output.

However, the chemical industry in the State is happy that the West Bengal Government in its 1981-82 budget recognises chemicals as a growth-oriented industry and to help it along further, the budget has reduced the entry tax on chemicals NES from 2 per cent to 1 per cent. The entry tax on denatured spirit, methylated spirit and alcohol used by the industries has been abolished while some relief has been given to pharmaceuticals.

34

YEARS OF INDEPENDENCE

THE FRUITS AND THE FUTURE

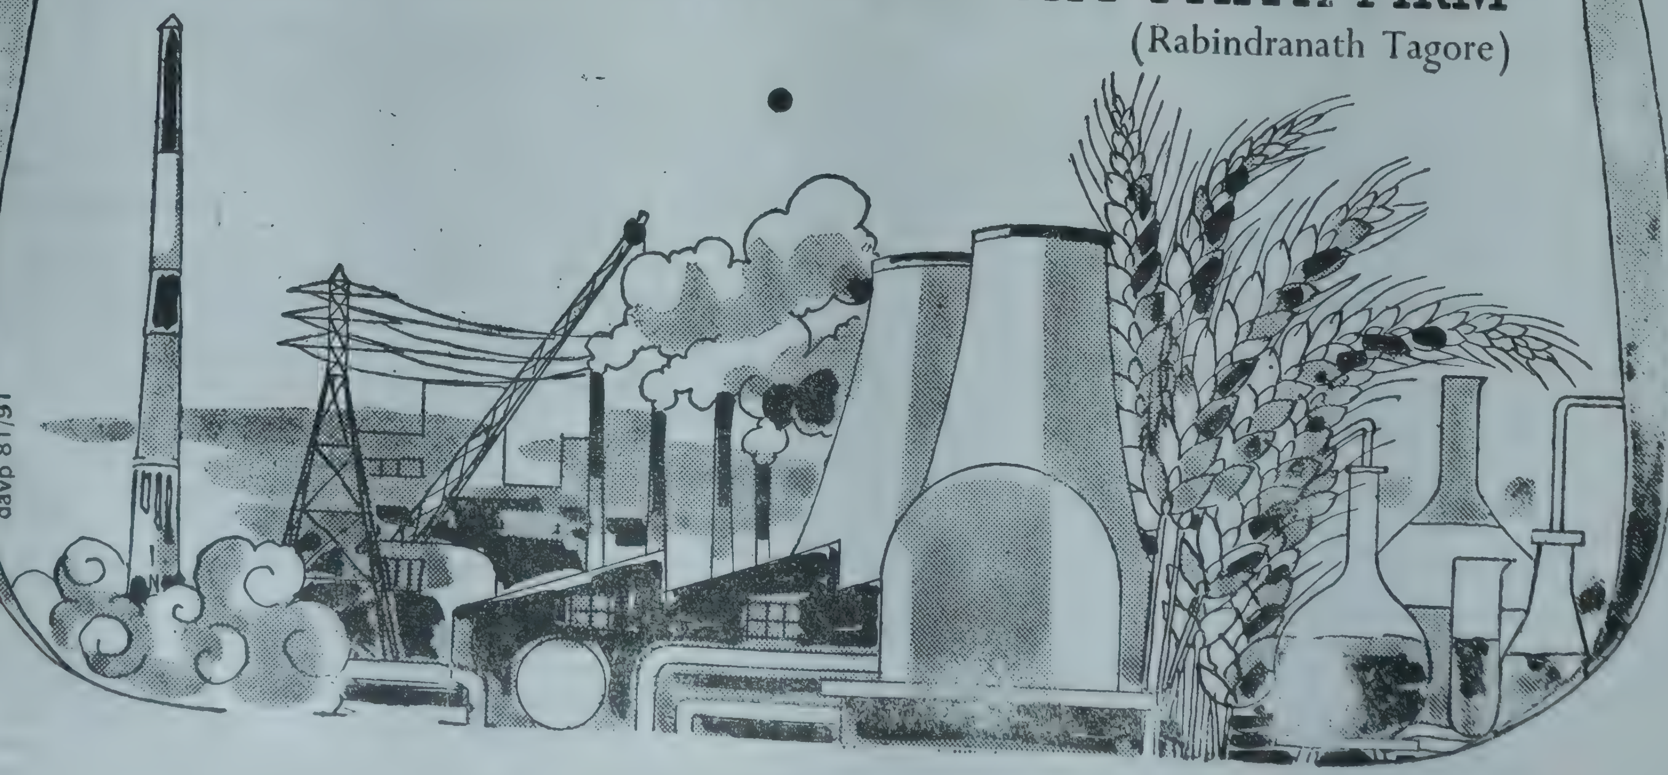
☐ we have built the foundation of a modern self-reliant economy.

☐ we have achieved self-sufficiency in food, diversified our industrial structure and made significant progress in science and technology.

By 1985
we aim at lifting one-sixth more of the people
above the poverty line and provide safe drinking water
to all the problem villages.
And by 2000
eradicate leprosy and reduce birth rate from 36
to 21 per thousand.

'THE DAY WILL DAWN, HOLD THY FAITH FIRM'

(Rabindranath Tagore)



Levels of living: Widespread poverty and illiteracy

By COMMERCE RESEARCH BUREAU

THE economic development during the last three decades has enabled a perceptible increase in the average per capita income at 1970-71 prices from Rs 466 in 1950-51 to Rs 678 in 1979-80 (Table 1). This increase has not made any appreciable impact on the low level of economic existence of the people and the incidence of poverty in the country is still very high leading to a low level of standard of living.

Standard of living is a very broad concept. Various factors go into the constitution of the standard of living of the people. One of the most important factors is the consumption standards. Poverty and undernourishment constitute a very widespread problem in the present day world. It is found that large sections of people live below any acceptable minimum standard of living especially in the developing countries. The improvement in the standard of living of the people depends mainly on two factors (i) creation of assets — *i.e.* socially owned assets like roads, irrigation works etc and assets predominantly owned or controlled by individuals and (ii) levelling of incomes. Despite high economic growth rates in many countries the additions to income have been unevenly distributed and have failed to bring about appreciable improvement in living standards of the population in the lower income groups.

The symptoms of poverty or the signs indicating the lack of access to basic needs are malnutrition, illiteracy, slums, inaccessibility to public facilities, overcrowding, high infant mortality rate etc.

Rural structure and illiteracy

India continues to be predominantly rural although its rate of urbanisation has shown marked increase over the years from 10.4 per cent in 1911 to 23.7 per cent in 1981. In other words, despite showing a decline in the percentage of rural population, 76.3 per cent of its population today live in rural areas. Similarly, with all the Plan efforts over the years to increase the number of literates in the country, as many as about 45 crore people today are considered illiterate. This is despite the fact that the literacy percentage has gone up from 5.9 in 1911 to 36,2 in 1981. This is mainly because of the phenomenal growth of population — 25.21 crores in 1911 to 68.38 crores in 1981. The data on urban population and literacy for the past four decades is shown in Table 2.

Fall in real income

In India more than three-fourths of its population live in rural areas. Agriculture and allied activities form the mainstay of more than 70 per cent of its working population contributing over 36 per cent of the national income (at current prices). Yet the income these activities provide to agricultural workers is substantially below average and almost at the subsistence level because of a number of factors.

According to the Rural Labour Enquiry 1974-75, the daily average wages of agricultural labour households were Rs 1.43 for men in 1964-65 while they were Rs 3.24 in 1974-75 — a rise of 127 per cent. However, in real terms (after deflating by the consumer price index number for agricultural workers) they were only Rs 1.26 — lower by 12 per cent than the 1964-65 wage. The daily average wages for women were Rs 2.27 in 1974-75 (money terms) as against Rs 0.95 in 1964-65.

On the basis of the data on value added per worker in 1970-71, it would be seen that although agriculture employed the largest number of workers in the country — 12.76 crore workers out of 17.83 crore workers — the value added per worker in agriculture was one of the lowest. At the same time the value added per worker in urban areas was invariably higher than that in the rural areas (Table 3).

Poverty line

The concept of poverty is difficult to define and includes not merely the

destitutes and the unemployed but also those whose earnings are below what may be regarded as the minimum acceptable standards.

In India poverty level is decided by the official agencies on the basis of a stipulated level of per capita consumption expenditure linked to per capita calorie requirement. People with consumption below this level would be considered as below the poverty line. In the absence of data on income distribution, the data on consumer expenditure collected by the National Sample Survey Organisation (NSSO) in its various rounds can be used to study consumption expenditure in the context of measuring poverty.

Those with per capita monthly consumption expenditure of Rs 76 or less (at 1979-80 prices) corresponding to a minimum daily calorie requirement of 2,400 per person in rural areas and the per capita per month consumption expenditure of Rs 88 or less corresponding to calorie requirement of 2,100 per person in urban areas are regarded as people below poverty line. The statewise data on population below the poverty line are given in Table 4.

It will be seen from the table that as many as 30.46 crore people or 48 per cent were living below the poverty line in India in 1977-78. Of these, 25.28 crore people were in rural areas and 5.18 crore people in urban areas. There was wide disparity in the percentage of population below the poverty line in different States. The percentage was the highest (66 per cent) in Orissa and the lowest (15 per cent) in Punjab.

On the basis of the household consumer expenditure in India in 1977-78, it would be seen that the poorest 30 per cent of the rural population accounted for only 15 per cent of the expenditure in rural areas while the rich or the top 30 per cent of the rural population accounted for as much as 52 per cent of the expenditure. Similarly, in urban areas the poorest 30 per cent of the population accounted for 13.6 per cent of the expenditure and the top 30 per cent population for 54 per cent of the expenditure (Table 5).

As regards the pattern of consumer expenditure it can be said that poorest people spend more on food items and less on non-food items. For people with highest consumption expenditure it is *vice-versa*. As people get higher incomes they eat better and spend proportionately less on food. The richest households spend a higher proportion of their total budget on housing, fuel, light and water than the poorest do on all non-food items. Not only is food the main element in poor people's budgets but preparing takes up a lot of their time. The per capita monthly expenditure on food and non-food items in rural and urban areas according to various survey rounds of the National Sample Survey (NSS) Organisation is shown in Table 6, while the distribution of per capita monthly expenditure on different items of consumption according to various expenditure classes in rural and urban areas for 1968-69 is presented in Table 7.

(...) = Not available

Notes: 1. Results are based on provisional and quick tabulation of the NSS on household consumer expenditure of 32nd round (July 1977 to June 1978).

2. The difference between the aggregate all-India private consumption expenditure estimated by the Central Statistical Organisation in the National Accounts Statistics and that derived from the NSSO data has been prorata adjusted among the different States and Union Territories in the absence of any information to allocate this difference among the States and Union Territories.

3. The number of people below poverty line relates to the population as on March 1, 1978.

4. For all-India the number and percentage of people below poverty line correspond to the population of the States included in the table.

5. Figures in this table and despatches from State correspondent do not necessarily tally because of the differing years of reference and differing sources of information.

Low level of asset holdings

The majority of the poor live in the rural areas and belong to the categories of landless labourers, small and marginal farmers, rural artisans including fishermen, and backward classes and backward tribes. These people have either no assets or assets with very low productivity, few relevant skills and no regular fulltime jobs or very low paid jobs. The distribution of assets in rural areas, as brought out by the All-India Debt and Investment Survey is given in Table 8. It would be seen from the table that the level of asset holdings of the poorest 30 per cent in rural areas was very low and that there was no significant change in the structure of asset ownership in rural areas during 1961-71. The Planning Commission has defined 'poor households' as those with less than Rs 1,000 of assets in 1961 and Rs 2,500 in 1971. On the basis of these, the percentage of such households increased from 30 per cent in 1961 to 35 per cent in 1971. The bulk of the assets of these poor households consisted only of their huts, some household goods and some livestock.

Wide disparity in land holdings

The principal productive asset in rural areas is land. However, according to the Agricultural Census 1976-77, small and marginal farmers who constituted about 73 per cent of the landholders, operated barely 24 per cent of the land. On the other hand, big farmers (*i.e.* holding more than 10 hectares of land) accounted for only three per cent of the landholders but operated as much as 26 per cent of the land (Table 9).

Under the revised land ceiling laws the land declared surplus was 15.2 lakh hectares of which 10 lakh hectares was taken possession by the states. Up to February 7, 1981, about seven lakh hectares of land was distributed to 12.23 lakh landless labourers.

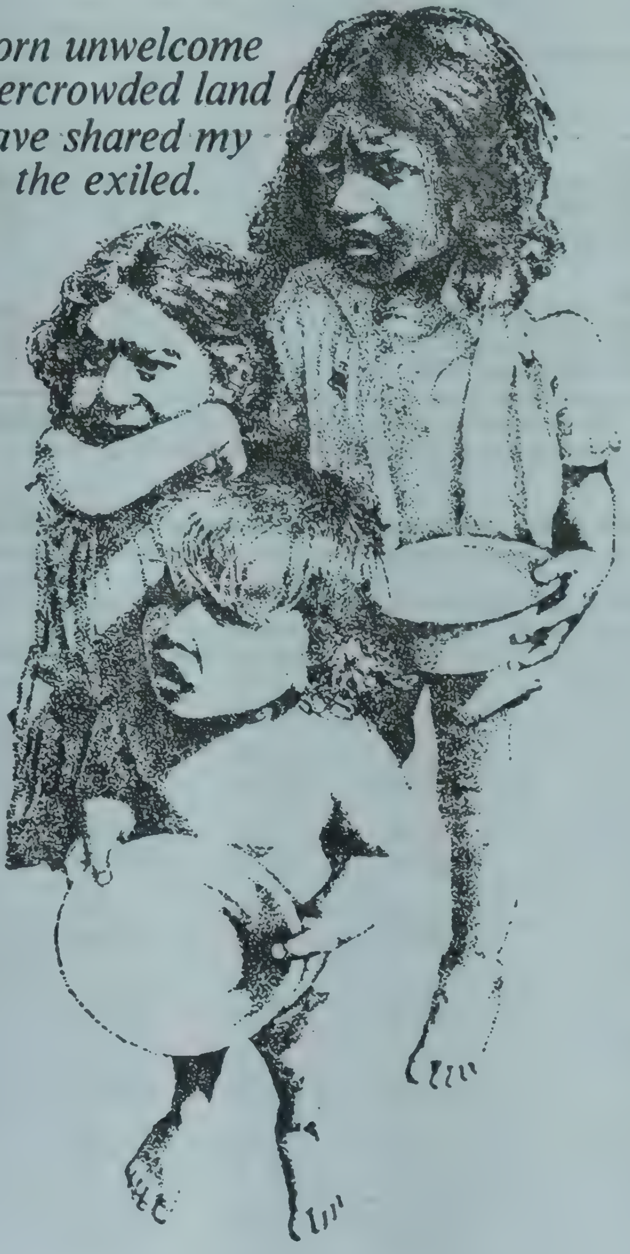
Between 1970-71 and 1976-77, the average size of land holding declined from 2.30 hectares to 2 hectares.

Nutritional deficiency

The consumption standard of an average Indian adult is very low in rela-

Ours is a Magnificent Land-2

I was born unwelcome
into an overcrowded land.
But I have shared my
home with the exiled.



I exist in a village
imprisoned by my fields.
But in quest of my spices
man discovered a globe.

I adorn my emaciation
with the tatters of penury.
But I have gifted the world
the luxury of fine muslin.

My cookfires I light
with the dung of cattle.
But I have taught man the
abstraction of algebra.

I grew up untutored,
unmusic'd and unsung.
But my syncopated sitar
has driven nations to frenzy.

I am surrounded by children
with malnourished minds.
But I have given man
his first philosophy.

I craft shoes that shod
three whole continents.
But I have just begun
to stand on my own bare feet.

I am named by many names
in a babel of tongues.
But I have adopted a name
by strangers given: India

I am sad.
But I am glad.

tion to nutritional requirement. In particular, the protein intake is about one-third of the requirement. An increase in the protein intake, along with other nutritive elements, is absolutely necessary in order to increase the average height, weight and stamina and even improve the brain development of Indians. According to authoritative estimates, the intake of protein in India during recent years has been of the order of 49 grams per capita per day as against 68 grams in Kenya, 78 grams in Turkey and above 100 grams in Australia, New Zealand, Argentina and France. The disparity is particularly marked in respect of the intake of animal protein. In India it is six grams per capita per day against 16 grams in Kenya, 15 grams in Turkey and above 50 grams in the United Kingdom, Germany, Argentina, France, the United States, Canada, Australia and New Zealand. The nutritional level per adult in India is shown in Table 10 while the per capita availability of certain important items of consumption is given in Table 11.

As can be seen from Table 11, during the period 1950-51 to 1979-80 the per capita availability of pulses declined from 61 grams to 30 grams per day or by about 50 per cent, milk from 48 kg (in 1950-51) to 45 kg (in 1978-79) or by six per cent and cotton cloth from 11 metres to 10 metres (about 10 per cent). On the other hand, the availability of man-made fabrics, sugar and tea has shown substantial rise during the same period.

It is generally observed that the availability and the use of luxury items, *i.e.*, items not entering into mass consumption have gone up over the years — the number of refrigerators per million of population increased from 26 in 1960-61 to 278 in 1978-79 and air-conditioners from 25 per million population to 33 per million population. The use of other items like telephones and television sets has also shown marked increase.

An estimate of nutritional inadequacy for 1971-72 shows that the percentage of population suffering from either caloric or protein deficiency (or both) was 28.8 per cent in rural areas and 32.6 per cent in urban areas.

Ireland — 3,541 (141 per cent) and Austria — 3,535 (134 per cent).

The best and the direct way to attack poverty is to increase production of key nutritive items like milk, eggs and fish, green vegetables and fruits as also improve the purchasing power of the people to increase the consumption of these items. The problem of nutrition has two aspects. First, malnutrition of vast masses implies gross inequality and social injustice. Secondly, malnutrition is also responsible for the low level of per worker productivity.

Inadequate medical facilities

Sustained efforts towards promotion of health care services during the last 30 years have resulted in significant improvement in the health status of the country. The mortality rate declined from 27.4 in 1941-51 to 14.2 in 1978. The life expectancy at birth has improved from 32 years in 1951 to about 52 years in 1976-81. The infant mortality rate has come down from 146 during the fifties to 129 in 1976. There has also been improvement in doctor-population ratio which varies widely from one doctor for 8,333 in Meghalaya to one doctor for 1,400 in Delhi (1977). The hospital bed-population ratio has also shown improvement from 32 beds per lakh of population in 1951 to 73 beds per lakh of population in 1976.

However, despite all these improvements, it is noted that the best of the doctors and hospital facilities and a disproportionately large share of health services are in the urban areas. On the other hand, situation in villages is abominable. The Government medical facilities are practically free but the quality of services is so poor that those who can afford generally prefer to avail themselves of the services of the private practitioners. Again, there is a dearth of doctors in the rural areas.

Strategy for Sixth Plan

Even after three decades of planning large segments of the population have yet to share in the benefits of progress or participate in the process of development. Although several programmes like Small Farmers' Development Agency (SFDA) and Marginal Farmers and Agricultural Labourers (MFAL) were undertaken since the Fourth Plan to help backward areas and weaker sections, the impact of these programmes was rather limited. There is an urgent need for more effective implementation of assets transfer measures such as land reforms, more equitable distribution of credit and a co-ordinated effort which would enable the poor to join the mainstream of economic activity and provide them with an opportunity for advancement.

An evaluation survey of SFDA/MFAL projects by the Programme Evaluation Organisation (PEO) of the Planning Commission in 1974-75 (published in January 1979) revealed many deficiencies in the programme, such as weak co-operative infrastructure in the project areas and almost total neglect of agricultural labourers in the matter of credit. There was also low participation in irrigation programmes in some of the areas. The Integrated Rural Development Programme (IRDP) was devised taking into account the findings of this survey.

The Sixth Five Year Plan (1980-85) has placed a very high priority on the alleviation of poverty. The public sector outlay in the Sixth Plan provides for many poverty alleviation programmes which operate mainly by way of transforming assets and skills and by providing employment in the slack seasons of the year. The Integrated Rural Development Programme (IRDP) belongs to the former category and the National Rural Employment Programme (NREP) to the latter. Besides, there are a large number of other public sector schemes which would contribute to the reduction of unemployment and underemployment. Some of the schemes which could be cited here are: special component plan for the uplift of scheduled castes, special programmes for drought-prone areas; tribal areas and hill areas and the minimum needs programme. The objectives of these programmes would be to improve productivity and therefore income of the poor and also to ensure that employment opportunities are enlarged at a faster pace. The details of some of the programmes to be pursued during the Sixth Plan are given in the following paragraphs.

Integrated Rural Development Programme

The main objective of the IRDP during the Sixth Plan would be to evolve an operationally integrated strategy—increasing production and productivity in agriculture and allied sectors on the one hand and development of resource and income of vulnerable sections of the population in all the blocks of the country on the other.

The total number of households to be covered under the IRDP during the Plan period would be nearly 3,000 fami-

lies per block. These families would be from the bottom deciles of the rural population below the poverty line. There are altogether 5,000 blocks in the country. In other words, the programme proposed to cover 7.5 crore people—more than 13 per cent of the rural population. The total investment outlay would be Rs 1,500 crores, supplemented by Rs 3,000 crores from institutional finance. On the basis of this transfer of assets, it would be possible to generate an income of Rs 3,000 crores per annum. The amount of income transfer would help bring nearly 11 per cent of the rural population (6.1 crores in 1984-85) above the poverty line covering about 1.2 crore households in the rural sector. Besides, a provision has been made in the Plan to move 61 lakh poor people from the urban sector above the poverty line by providing additional consumption benefits to these people mainly through public redistributive services like health, education and sanitation, housing and drinking water and urban slum improvement programmes.

National Rural Employment Programme

The problem of employment in rural areas is mainly of seasonal unemployment and underemployment. It is therefore necessary that fuller employment opportunities for the rural work force should be found within the agricultural and allied sectors through intensification and diversification of agriculture based on expansion of irrigation and improved technology.

As for providing supplementary employment opportunities, a beginning was made in this direction through the Food-for-Work Programme. The beneficiaries of various development projects and the rural development programmes would mainly be those with an asset base whereas in rural areas a large number of people are without assets or with grossly inadequate assets. This segment of the rural poor which largely depends on wage employment has virtually no source of income during the lean agricultural period. The PEO had carried out an evaluation survey of the Food-for-Work Programme during August-October 1979. The main findings were that at many places work done under the programme was not durable and most of the works related to construction of link roads and embankments. Subsequently, the National Rural Employment Programme (NREP) was conceived mainly to take care of this segment of the rural poor.

An outlay of Rs 980 crores has been provided for the NREP for the Sixth Plan period in the Central sector. There would be a provision in the State Plans for this programme from 1981-82 onwards as it would be operated on 50:50 sharing basis. The Centre would provide its share in the form of foodgrains to the extent surplus foodgrains are available and the rest in cash.

Under the programme, the implementing agencies would be required to give priority to works relating to social forestry and pasture development, soil and water conservation, irrigation, flood protection and drainage, field channels in irrigation command areas, construction and improvement of village tanks and ponds, school and dispensary buildings and works to improve village environments, hygiene and sanitation.

In order to ensure that benefits of the NREP reach the weaker sections of the society, at least 10 per cent of the allocation under the programme would be earmarked for utilisation exclusively on programmes of direct benefits to scheduled castes such as drinking water in Harijan bastis, community irrigation schemes in which the majority of the beneficiaries would be Harijans, environmental works in Harijan localities and housesites group housing for Harijans.

Minimum Needs Programme

The Minimum Needs Programme is essentially an investment in human resource development. The provision of free or subsidised services through public agencies is expected to improve the consumption levels of those living below the poverty line and thereby improve the productive efficiency of both the rural and urban workers. The Sixth Plan has provided a much larger outlay of Rs 5,807 crores (Rs 4,926 crores in state plans and Rs 883 crores in the Central plan) for the programme than Rs 2,607 crores for the Fifth Plan. The various components of the MNP with their respective outlays in brackets are: rural water supply (Rs 2,007 crores) rural roads (Rs 1,165 crores), elementary education (Rs 905 crores), rural health (Rs 577 crores), housing assistance to rural landless labourers (Rs 354 crores), rural electrification (Rs 301 crores), nutrition (Rs 219 crores), environmental improvement of urban slums (Rs 151 crores) and adult education (Rs 128 crores). The objectives and targets for the Plan period for these components are given below:

(i) *Rural water supply*: According to a survey conducted in 1971-72 in all 1,52,475 villages were declared "problem villages" in the country in respect of drinking water supply. The statewise number of problem villages is given in Table 12. Subsequently, more villages were declared problem villages by states. The number was estimated to be 1.90 lakhs as on April 1, 1980. The identification of problem villages was done on the following criteria: (a) villages which did not have an assured source of drinking water within a reasonable distance of 1.6 km, (b) villages which were endemic to diseases like cholera, guinea-worm, etc and (c) villages where the available water had an excess of salinity, iron, fluorides or other toxic elements.

Table 12: Statewise problem villages

SOURCE: Answer to the **Starred Question No. 594** in the **Lok Sabha** on 30th March, 1981.

During the Sixth Plan efforts would be made to cover all the problem villages providing them with safe drinking water.

(ii) *Rural roads*: Under the Fifth Plan, the norm was to link up all villages with a population of 1,500 or more with all-weather roads. It is now proposed to connect with roads all the remaining villages with a population of 1,500 and above and 50 per cent of the villages in the population group 1,000—1,500 by 1990. The number of villages remaining to be linked according to the above norm was 40,000 as on April 1, 1980. About 50 per cent or 20,000 of these villages would be covered by 1985.

(iii) *Elementary education*: The objective would be the universalisation of elementary education by achieving 100 per cent enrolment in the age group 6-14 by 1990. It is envisaged to achieve

95 per cent of enrolment in the age group 6-11 and 50 per cent in the age group 11-14 by 1985 and this would be supplemented by non-formal education.

(iv) *Rural health*: The rural health infrastructure would be further strengthened to achieve the objective of health for all by 2000 AD. The norms envisaged for this would be: (a) one community health volunteer for every village or a population of 1,000 chosen by the community to form the base unit, (b) one sub-centre for a population of 5,000 in plains and 3,000 in hilly and tribal areas, (c) one primary health centre for 30,000 population in the plains and 20,000 population in hilly and tribal areas and (d) one community health centre for a population of one lakh or one community development block.

(v) *Housing assistance to rural landless labourers* : The number of landless labour households needing housing assistance is estimated to be around 145 lakhs by March 1985. So far 77 lakh landless families were allotted housesites. The remaining 68 lakh familities would be provided housesites by 1985.

(vi) *Rural electrification* : It is proposed to ensure that at least 60 per cent of villages in each State and Union Territory are electrified by 1990. Of the total number of 1,15,165 villages required to be electrified to achieve this target, 40 per cent or about 46,464 additional villages would be electrified during 1980-85.

(vii) *Nutrition* : This programme has two components : (a) special nutrition and (b) mid-day meals. While the former was introduced in 1970-71, the latter came into being much earlier in 1962-63.

Under special nutrition, 300 calories and 8-12 grams of protein are provided to children in the group 0-6 for 300 days and 500 calories and 25 grams of protein for the pregnant and nursing mothers for 300 days. The eligible target group for this programme as on April 1, 1980 was 700 lakh children of 0-6 years and 70 lakh mothers. The scheme is estimated to have covered 81.8 lakhs — 57.3 lakhs outside the Plan and 24.5 lakhs under the Plan — by the end of March 1980. During the Sixth Plan an additional 50 lakh children and five lakh women would be rovered by providing integrated services of feeding, health welfare, etc.

Under the mid-day meals programme children of 6-11 age group are provided with mid-day meals for 200 days in a year and 300 calories and 8-12 grams of protein per child per day. During the Sixth Plan it is proposed to continue the existing level of beneficiaries of about 174 lakh children as also to integrate the programme with other essential services.

(viii) *Environmental improvement of urban slums* : Of the urban population nearly a fifth is estimated to constitute slum population. The slum population in 1985 needing attention is estimated to be about 331 lakhs. Of this, only 68 lakhs were covered by March 1980. It is proposed to cover about 40 per cent or 100 lakh slum population by 1985. Under this programme facilities like water supply, storm water drains, paving of streets, street lighting and community latrines are provided.

(ix) *Adult education* : Non-formal education for adults, particularly in the productive age group 15-35 years, is in fact a part of the elementary education component of the MNP. It is proposed to achieve 100 per cent coverage of the age group 15-35 years by 1990.

Impact of development programmes

The Planning Commission in the Sixth Five Year Plan document has worked out the projections for the average monthly per capita consumption expenditure in urban and rural areas, taking into consideration the impact of various developmental programmes to be implemented during the Plan period (Table 13).

It would be seen from the table that the average monthly per capita consumption expenditure in 1979-80 (at current prices) was put at Rs 87.97 for rural areas, Rs 123.16 for urban areas and Rs 95.62 for the country. The percentages of people below the poverty line were estimated to be 50.7 in the rural areas, 40.3 in the urban areas and 48.4 in the country as a whole.

Without taking into account the redistribution likely to arise out of the developmental programmes, the percentages of people below the poverty line would have been 40.5 for rural, 33.7 for urban and 38.9 for the country by 1984-85. However, after considering the expected benefits from such programmes the proportion of the people below the poverty line was expected to come down to 30 per cent in all categories.

Table 13: Consumption expenditure

A. Consumption expenditure*: 1979-80

Population Group	Average monthly per capita consumption (Prices)			Number of people (in million)		
	Rural	Urban	Total	Rural	Urban	Total
Bottom decile	32.11	41.38	34.12	51.20	14.21	65.41
Below poverty line**	51.27	59.75	52.80	259.56 (50.70)	57.28 (40.31)	316.84 (48.44)
Total population	87.97	123.16	95.62	512.00	142.10	654.10

B. Consumption expenditure*: 1984-85
(without redistribution)

Population Group	Average monthly per capita consumption (Rupees at 1979-80 Prices)			Number of people (in million)		
	Rural	Urban	Total	Rural	Urban	Total

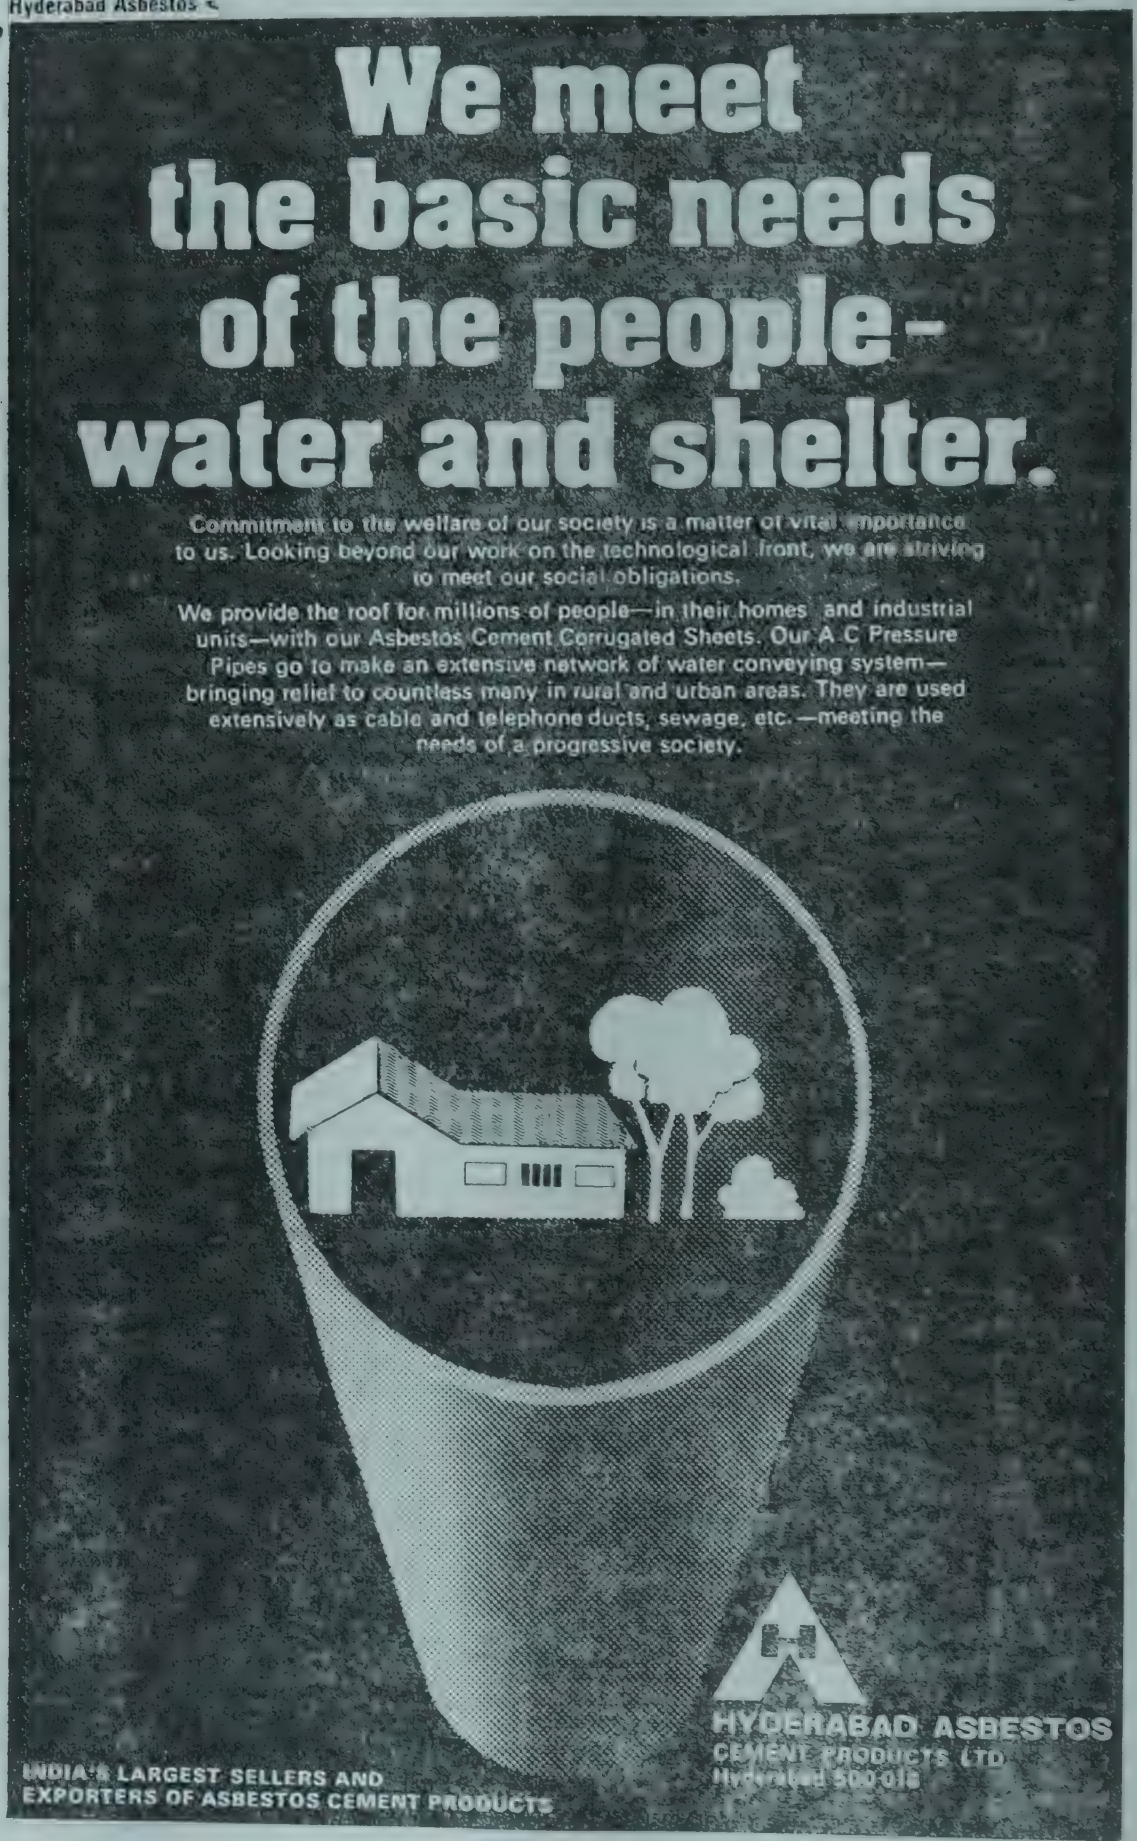
Hyderabad Asbestos



We meet the basic needs of the people - water and shelter.

Commitment to the welfare of our society is a matter of vital importance to us. Looking beyond our work on the technological front, we are striving to meet our social obligations.

We provide the roof for millions of people—in their homes and industrial units—with our Asbestos Cement Corrugated Sheets. Our A C Pressure Pipes go to make an extensive network of water conveying system—bringing relief to countless many in rural and urban areas. They are used extensively as cable and telephone ducts, sewage, etc.—meeting the needs of a progressive society.

ANDHRA PRADESH

The hard-pressed agricultural labourers

From A SPECIAL CORRESPONDENT

HYDERABAD

ON August 15, 1981, India will be celebrating the 34th anniversary of independence. Where, on the path of progress does this occasion find the people of Andhra Pradesh?

The number of people below the poverty line stood at 206.79 lakhs or 42.18 per cent of the population—170.35 lakhs or 43.89 per cent in the rural areas and 36.44 lakhs or 35.68 per cent in the urban areas. The poverty line is defined as Rs 65 per capita per month of consumption expenditure in 1977-78 prices corresponding to the minimum daily calorie requirement of 2,400 per person in rural areas and that of Rs 75 corresponding to the calorie requirement of 2,100 in urban areas.

The State's domestic product at 1970-71 prices was Rs 2,522.8 crores in 1970-71 and Rs 3,256 crores in 1979-80. The per capita income (at 1970-71 prices) during the same period increased from Rs 586 in 1970-71 to Rs 648 in 1979-80.

The State Government has been proclaiming through advertisements its great achievements. The achievements are manifold, particularly in agriculture, education, health, power and communication. But it will be foolish to regard that the above are beneficial to all alike. In an economy like India's, the ownership of the means of production and exchange *i.e.* land, factories and income determines the levels of living of the population.

To begin with, let us see the levels of living of the lowest strata—the agricultural labourers. According to the 1971 census they constituted seven million or about 38 per cent of the rural workforce in Andhra Pradesh. Till today, they have no fixed hours of work or payment. They are paid the least for the hardest manual labour, in rain and sun, without any rules or acts to protect them. Most of them belong to scheduled castes. Ninety per cent of their total income is spent on food. Just 50 per cent of those eligible have been allotted land sites by the Government for housing, of which not even one per cent is *pucca*. Their children cannot afford to go to school. Higher studies are possible for less than one per cent. They have access only to the community well or the public water tanks and canals. Medical care has reached them, but their main disease is

Commerce Research Bureau

malnutrition which is outside the jurisdiction of medical care. Within the Andhra region the level of living of the agricultural workers in Krishna, Godavari (East & West) Visakhapatnam, Guntur, Nellore and Ongole districts has improved somewhat. Though they are still below the poverty line, their wage rates and conditions of their employment have improved, while those of their brothers in other areas, particularly in the Telengana Region have gone from bad to worse resulting in their migration to Madras and Bombay as construction workers and up to Punjab as agricultural workers.

Andhra Pradesh has about 22.3 lakh population of scheduled tribes. Because of the laws against deforestation and the entry of merchants and moneylenders, their lives are miserable. Srikakulam in the early seventies and Indravilli in Adilabad just this year are witness to their desperate protests.

Let us turn to the marginal farmers. However much the official economists may say that the terms of trade are favouring the agricultural commodities, the rising costs of inputs, especially fertilisers, proves this a myth. No one feels the pinch of this more than the marginal farmer. During the fifties, they were at least well nourished, but no more. Because of the penetration of dairies and high prices of pulses, they are compelled to sell milk and pulses, (sources of protein, fat and vitamines) to balance the family budget. To some extent they have benefited from education and better health facilities.

Despite land legislation, even today several land owners hold thousands of hectares, under the guise of orchards and co-operatives. Earlier they used to lease out land which they have now put to farming, with modern inputs. These big land owners along with rich peasants have grabbed most of the government-provided agricultural subsidies. They have a heyday, atleast for the time being. Along with farming and money lending, many of them have turned to commerce and speculation in township lands. For the last five years, the value of land around towns has been almost doubling every year. There is a tremendous increase in the standard of living of this stratum. In the fifties, the landlord was a miser consumer, restricting himself to a tiled house, cotton rags, chappals and a stick. The landlord today boasts of modern bungalows, two and four wheelers and electrical appliances. He is the master of local litigation and panchayat and legislative politics.

There is very little industrial development in Andhra. Most of the major industries are either State or Centre-owned. Even the little development is lopsided, centred around Hyderabad, Vishakhapatnam and Guntur. The State's surplus capital is flowing not into industry but into commerce, money lending, speculation and film production.

The industrial working class is 11 per cent of the total work force. In the organised sector they are able to retain their standard of living, but in the unorganised sector the standard is going down.

There is a manifold increase in the size of the middle class. It is a privilege for the educated to have a job today. Unemployment among the educated had reached six lakhs (registered unemployed) in 1980. Every year about a thousand graduates in engineering, medicine and agriculture each are coming to the job market, which is already saturated. As a result they are migrating to other states as also to other countries. In addition to the above, several thousand graduates in the faculties of arts and science and polytechnic are being turned out every year with no employment prospects. What is worse is that, though most of them are drawn from peasantry, they neither know farming nor are willing to do it. They have to live an uninspired life.

INDIAN COFFEE

COFFEE BOARD
COFFEE BOARD
1, Vidhana Veedhi
Bangalore 560 001

Indian Coffee, distinctive and delicious, gets its special aroma from the rich soil climate and culture of India.

Natured on the shaded slopes of the Western Ghats, with its spure extending Eastwards, Indian Coffee is grown under ecological conditions ideal for the growth of the finest coffee.

Coffee in India covers 1,96,228 hectares and accounts for 95,297 estates. Of this 93,215 are small holdings below 10 hectares and 2,082 are above 10 hectares. These estates employ 2,54,705 daily workers.

India's production of excellent coffee is about 1.30 lakh tonnes.

Careful picking of the coffee fruits, scientific processing curing done to set standards, and quality assessment leads to export of only the best INDIAN COFFEE.

Coffee exports during 1980-81 realised foreign exchange worth 202 crores of rupees.

Current efforts are aimed at increased production in traditional areas and bringing non-traditional areas under coffee, thus ensuring adequate supplies to meet increasing trends in exports and international consumption of the future.

COFFEE BOARD, INDIA.

ASSAM

Extensive malnutrition

From OUR SPECIAL CORRESPONDENT

GAUHATI

ASSAM, with its vast natural resources like crude oil, natural gas, coal, lime stone and rich forests, presents a paradoxical picture of backwardness in the midst of potential plenty. Malnutrition is a major contributor to the high rate of infant and child mortality. A rough idea of the extent of malnutrition can be had from the fact that more than 60 per cent in the State still live below the poverty line. The level of income of sizable section of the population is such that even after spending 80 per cent of their income on food alone, they are not in a position to have a balanced diet. Protein-calorie-malnutrition is widely prevalent. A study made by the National Institute of Public Co-operation and Child Development recently revealed that a large percentage of pre-school children (75.3) had today weight below 75 per cent of standard weight for the age.

Assam with an area of 78,523 sq km accounts for 2.4 per cent of the country's total area and shelters 2.7 per cent of her population. The State with its 1.46 crore population in 1971 recorded a rate of increase much higher than the nation's average. This higher growth rate has been attributed mainly to immigration from both the rest of the country and outside it. During the decades 1951-61 and 1961-71, the population of the state increased by 34.98 per cent and 34.95 per cent against the country's 21.52 per cent and 24.82 per cent respectively.

The abnormal growth not only inflated the size of the State's total population, but also created economic, social, and political problems. The Draft Five Year Plan for 1980-85 reveals that Assam's net domestic product at constant prices rose at a flattering rate of 35 per cent during the seventies while the per capita net domestic product increased by only 6.2 per cent. A comparison of the growth of the State income with that of the national income brings the State's relative backwardness to focus. Taking three years averages, the national income at current prices grew by 384.7 per cent from 1961-64 to 1976-79 while the per capita national income rose by 250 per cent over the same period from Rs 335.6 to Rs 1,174.7. On the other hand, during that period the State's income increased by only 329.7 per cent and per capita income by only 174.4 per cent from Rs 332.2 to Rs 914.30.

The poverty indicator, too, is far from reassuring. Taking 2,700 calories

CAS/571

per consumer unit per day as the minimum standard, house-holds below it amounted to 55 per cent of the total in the rural areas of the state in 1973-74 as against 49 per cent in the entire country as a whole. A bird's eye view on the composition of State's income reveals its continued heavy dependence on the primary sector. The contribution from the primary sector at current prices was 63.9 per cent in the early seventies and 57.6 per cent in 1978-79 while the corresponding figure for the secondary sector were 14.09 per cent and 15.1 per cent only.

The increase in State income also does not necessarily reflect any real growth. It rose by around Rs 400 crores from 1973-74 to 1976-77 but about Rs 250 crores of this increase was accounted for by increased prices fetched by tea and minerals. Agriculture proper accounted for only Rs 75 crores of the increase although around two thirds of the working force in the State are directly engaged in the fields. In spite of the agriculture being the mainstay of the State's economy, it displays only signs of underdevelopment and backwardness. It is characterised by relatively small holdings and the 1976-77 agricultural census had recorded 82 per cent of the holdings and 48 per cent of the cropped area as being covered by holdings below 2 acres each while the crop intensity was recorded at as low as 123.5.

During 1971 census 40.88 lakh persons in the State were recorded as workers. Out of them 55.86 per cent were cultivators, 9.92 per cent agricultural labourers, 10.91 per cent engaged in animal husbandry, fisheries and forestry, thus making a total of 76.69 per cent. In household industry 1.30 per cent were engaged while 2.75 per cent in other industries making a total of only 4.14 per cent. This shows that while ¾th of the workers depended on the primary sector, less than 5 per cent derived livelihood from industry.

The problem of unemployment in the State has been growing steadily leading to poverty and backwardness. The Live Register of the Employment Exchanges contained 3.31 lakh names in June, 1980. The more significant fact is that the share of those with higher education has grown from 18 per cent in 1965 to 42 per cent in 1980.

However, the employment statistics as obtained from the Employment Exchanges reflect only the trend and not the totality of employment as all unemployed persons do not and cannot register themselves with the exchanges which are mostly located in the urban areas while bulk of the unemployment manifests itself in rural areas. Available estimates indicate that for at least five to seven months in a year, a sizable population remain idle for want of any subsidiary occupation.

Assam's percentage of literacy is 28.1 against 60.4 for Kerala, 39 for Tamil Nadu, 36 for Gujarat and 29.5 for all-India. In the field of female literacy the percentage for the State is just comparable with all-India average. Over the two decades 1951-71, the literacy percentage in the State has increased from 18.3 to 28.1 while for the country the increase is from 16.6 to 29.5. However, enrolment in educational institutions over the years 1955-56 to 1975-76 has shown substantial increase at all levels. In 1977-78, the school going children in different age groups in the State comprised 76 per cent children in 6-11 years, 44 per cent of those in 11-14 years and 25 per cent in 14-16 years age group. However, there are still over 2,000 villages in the State without a primary school which cover an estimated population of 8.6 lakhs of which 1.6 lakhs are children in the age group of 6-11 years. Over the period from 1961-62 to 1976-77, the number of primary schools per lakh of population declined from 131 to 114.

In regard to health facilities, the situation in rural areas particularly — is far from satisfactory where the facilities are considerably below the minimal requirement. However, during the successive five year plans, efforts have been made to control communicable diseases and to strengthen the basic health services in the State. In spite of all efforts health conditions remained poor. Infant and maternal mortality rates are still higher in rural areas. The shortage of doctors and para-medical personnel is an added factor for poor health condition in the State where only 33 per cent of its rural population is covered by basic health services. Out of 130 blocks in the State, 121 primary health centres are functioning of which only 88 have one doctor each, according to latest figures. The shortage of doctors in PHCs has resulted in low achievement of targets of immunisation fixed by the Central Government and other basic medical facilities.

Assam's relative backwardness is eloquently reflected in several other fields as well. The road length in 1978-79 was 111.5 km per lakh of estimated population as against the corresponding national figure of 235 km. The per capita consumption of electricity was as low as 30 units as against 130 units for the country as a whole in March 1980. Till 1980 only 15.6 per cent of the State's villages had been electrified while the country's average had been 41.8 per cent. The number of bank offices per one lakh population was only four in 1980 with per capita bank credit standing at about Rs 40.

BIHAR

Abject poverty and privation

From OUR SPECIAL CORRESPONDENT

PATNA

BIHAR with 74.8 per cent people still living below the poverty line has a hopelessly low and miserable standard of living. Most people are languishing in abject poverty, privation and illiteracy. The basic problems which afflicted the people in the early post-independence era still very much exist there nor can they be solved even within the coming 20 years. Problems of unemployment, housing, health and education are as acute as they were be in the past years.

During the last few years Bihar's economy has looked up and the growth rate and per capita income have shown signs of recovery and improvement, but this has not had to any impact on the living standards of the people. The fact is per capita income in the State has not only failed to keep pace with that of the country but on the contrary it has declined. So also the per capita investment and central assistance. Even in the matter of per capita power consumption the State's figure is only 84 kwh as against 100 kwh for the country as a whole. Bihar has only 38 km of surfaced roads per lakh of population against 90 km for the country.

Besides this, the standard of living throughout the State is uneven. It sharply differs from man to man and region to region, and community to community. The State with its three distinctly geographical regions quite separate from each other, has three distinct standards of living. The people of North Bihar with highly fertile lands and higher per acreage productivity are enjoying the highest standard of living followed by South Bihar Plain. Inhabitants of Chhotanagpur plateu have perhaps the lowest and most miserable living standard, where nature is comparatively unkind with infertile rocky soil.

Glaring inequality in income which of course greatly influences the living pattern and subsequently bedevils socio-economic relation is the worst bane of State. Economic benefits which accrued to their predominantly agricultural State during planning period are not evenly distributed. Resultantly, the more privileged section of the society has pocketed the lion's share of the fruits of development and the less privileged classes mainly small farmers, agricultural labourers have received practically nothing it. The living standards of landless agricultural labourers, who constituted 84 per cent of the total labour force, has gone down. Although the Government has

WHERE THE POOR SHALL PREVAIL

The entire thrust of Maharashtra's effort is on ensuring as far as is humanly possible that the meek shall inherit the earth.

To this end the definition of 'small farmers' has been revised to cover those owning dry land upto six hectares (15 acres) or whose lands are assessed upto Rs. 15. These farmers form the larger part of the State's farming community.

The Sanjay Gandhi Niradhar Anudan Yojana, which takes care of the destitute, and the Sanjay Gandhi Swavalamban Yojana which helps put unemployed youth on their feet, are other facets of this effort. The decision to establish horticultural co-operative estates for landless labourers is yet another.

The unique Hutatma Smarak Scheme inaugurated in Bombay on August 9 to herald the erection of 204 monuments to freedom martyrs all over the State, all but a few of whom were poor, and to give their next of kin financial help, underscores the Government's commitment to the needy, the forgotton and the neglected.

The vigorous implementation of the Prime Minister's 20-Point Programme along with the Government's Five Year Plan, the two of which meet at many points, completes the story of a massive and formidable effort that has the just society as its ultimate aim.

It is appropriate that on this auspicious day we pledge ourselves once again to do our duty by those to whose strivings and sufferings we owe our continued existence — in short, to make Maharashtra a State.

WHERE THE POOR SHALL PREVAIL

Directorate General of Information and Public Relations,
Government of Maharashtra, Mantralaya, Bombay 400 032.

made some piecemeal efforts to see that they get reasonable remuneration and fixed the minimum wages to enable them to get share of agricultural development. But all these things remain mostly on paper. The Government has failed to implement the minimum wages legislation. Big landlords who are influential in the government and political levels have managed to bypass the Act.

The landless and homeless agricultural workers who have been given agricultural land and homestead under the Land Ceiling Act amidst fanfare of official publicity have been mostly forcibly evicted from their homestead and land. So it has been seen that they have been denied their legitimate share of national development and they continue to live in abject poverty and cannot have even one square meal a day.

It is true that the State Government has made arrangements for free education, stipends and hostel accommodation for them but the question is : how many of them avail themselves of the opportunity ? Most of their children are sent to work in fields and houses of landlords from their very childhood. So when the question of earning bread appears to be a big problem any talk of educating and employing them in government offices sounds strange and misleading.

The problem of unemployment remains as acute as it was during the fifties. Besides seasonal unemployment of agricultural workers who migrate to neighbouring states of West Bengal, Assam and Uttar Pradesh there has been steady rise in number of educated unemployed youth during the last 20 years. About 21.69 lakhs are unemployed in the State of them 9.6 lakhs are educated unemployed. About 30,000 women are job-seekers in the State.

Of the workers in Bihar, 43.3 per cent are cultivators and 38.9 per cent are agricultural labourers. Thus 82 per cent of the workers are engaged in agriculture. The corresponding percentage for the entire country is only 69.7 per cent. Only 3.2 per cent of the workers are engaged in trade and commerce and 2.5 per cent in household industries. Manufacturing industries, other than household industries have 2.6 per cent of the total workers.

Job opportunities in small scale and medium industries have further shrunk due to sluggish trend in industrial development. Big and heavy industries are almost running in recurring losses and practically stop fresh recruitment. So the number of people engaged in industrial sector remains the same as it was in 1976. So the contribution of industries to State income dropped to 5.6 per cent only whereas that of agriculture to 38.20 per cent.

In the educational field Bihar has a very shameful record with literacy rate of 20.3 per cent only. During the last 10 years from 1971 to 1981 progress of education has been a dismal one. The rate of literacy went up by only 2 per cent from 19.2 per cent in 1971 to 20.3 per cent in 1981. In spite of free and adult education, facilities, distribution of free books and copies among the poor and backward students, enrolment in this age group of 6-11 and 11-14 is still very low. The enrolment of boys and girls in the age-group of 6-11 has risen only to 38.16 lakhs and 14.20 lakh in 1979-80 from 36.16 and 13.20 lakh in 1975-76.

Although the State Government has made available facilities of primary education within a radius of 1.5 km and middle level education within the radius of 5 km and opened many new schools with free accommodation facilities in hostel for *Adivasis* and other backward classes students. The number of students coming to avail of these opportunities is not encouraging at all, particularly in the areas of Chotanagpur and Santhal Parganas. The State Government has stepped up number of scholarship from 2,480 in 1976 to 4,000 and the monthly rate has also been enhanced from Rs 10 to Rs 15.

At present there are 60,508 primary schools and 12,000 middle schools with and total number of students of 65 lakhs in Bihar. Expenditure per student on primary education in government schools is only Rs 200. But the state of health of these schools is highly unsatisfactory. About 35 per cent of the primary schools have no buildings at all. The number of teachers in proportion to students is not adequate. Quality and standard of education has also gone down. There are large scale complaints against teachers for not holding classes regularly and finishing the syllabus which has resulted in higher percentage of failures in examination. Reports of adopting large scale unfair means by students in examination have been received from different parts of the State.

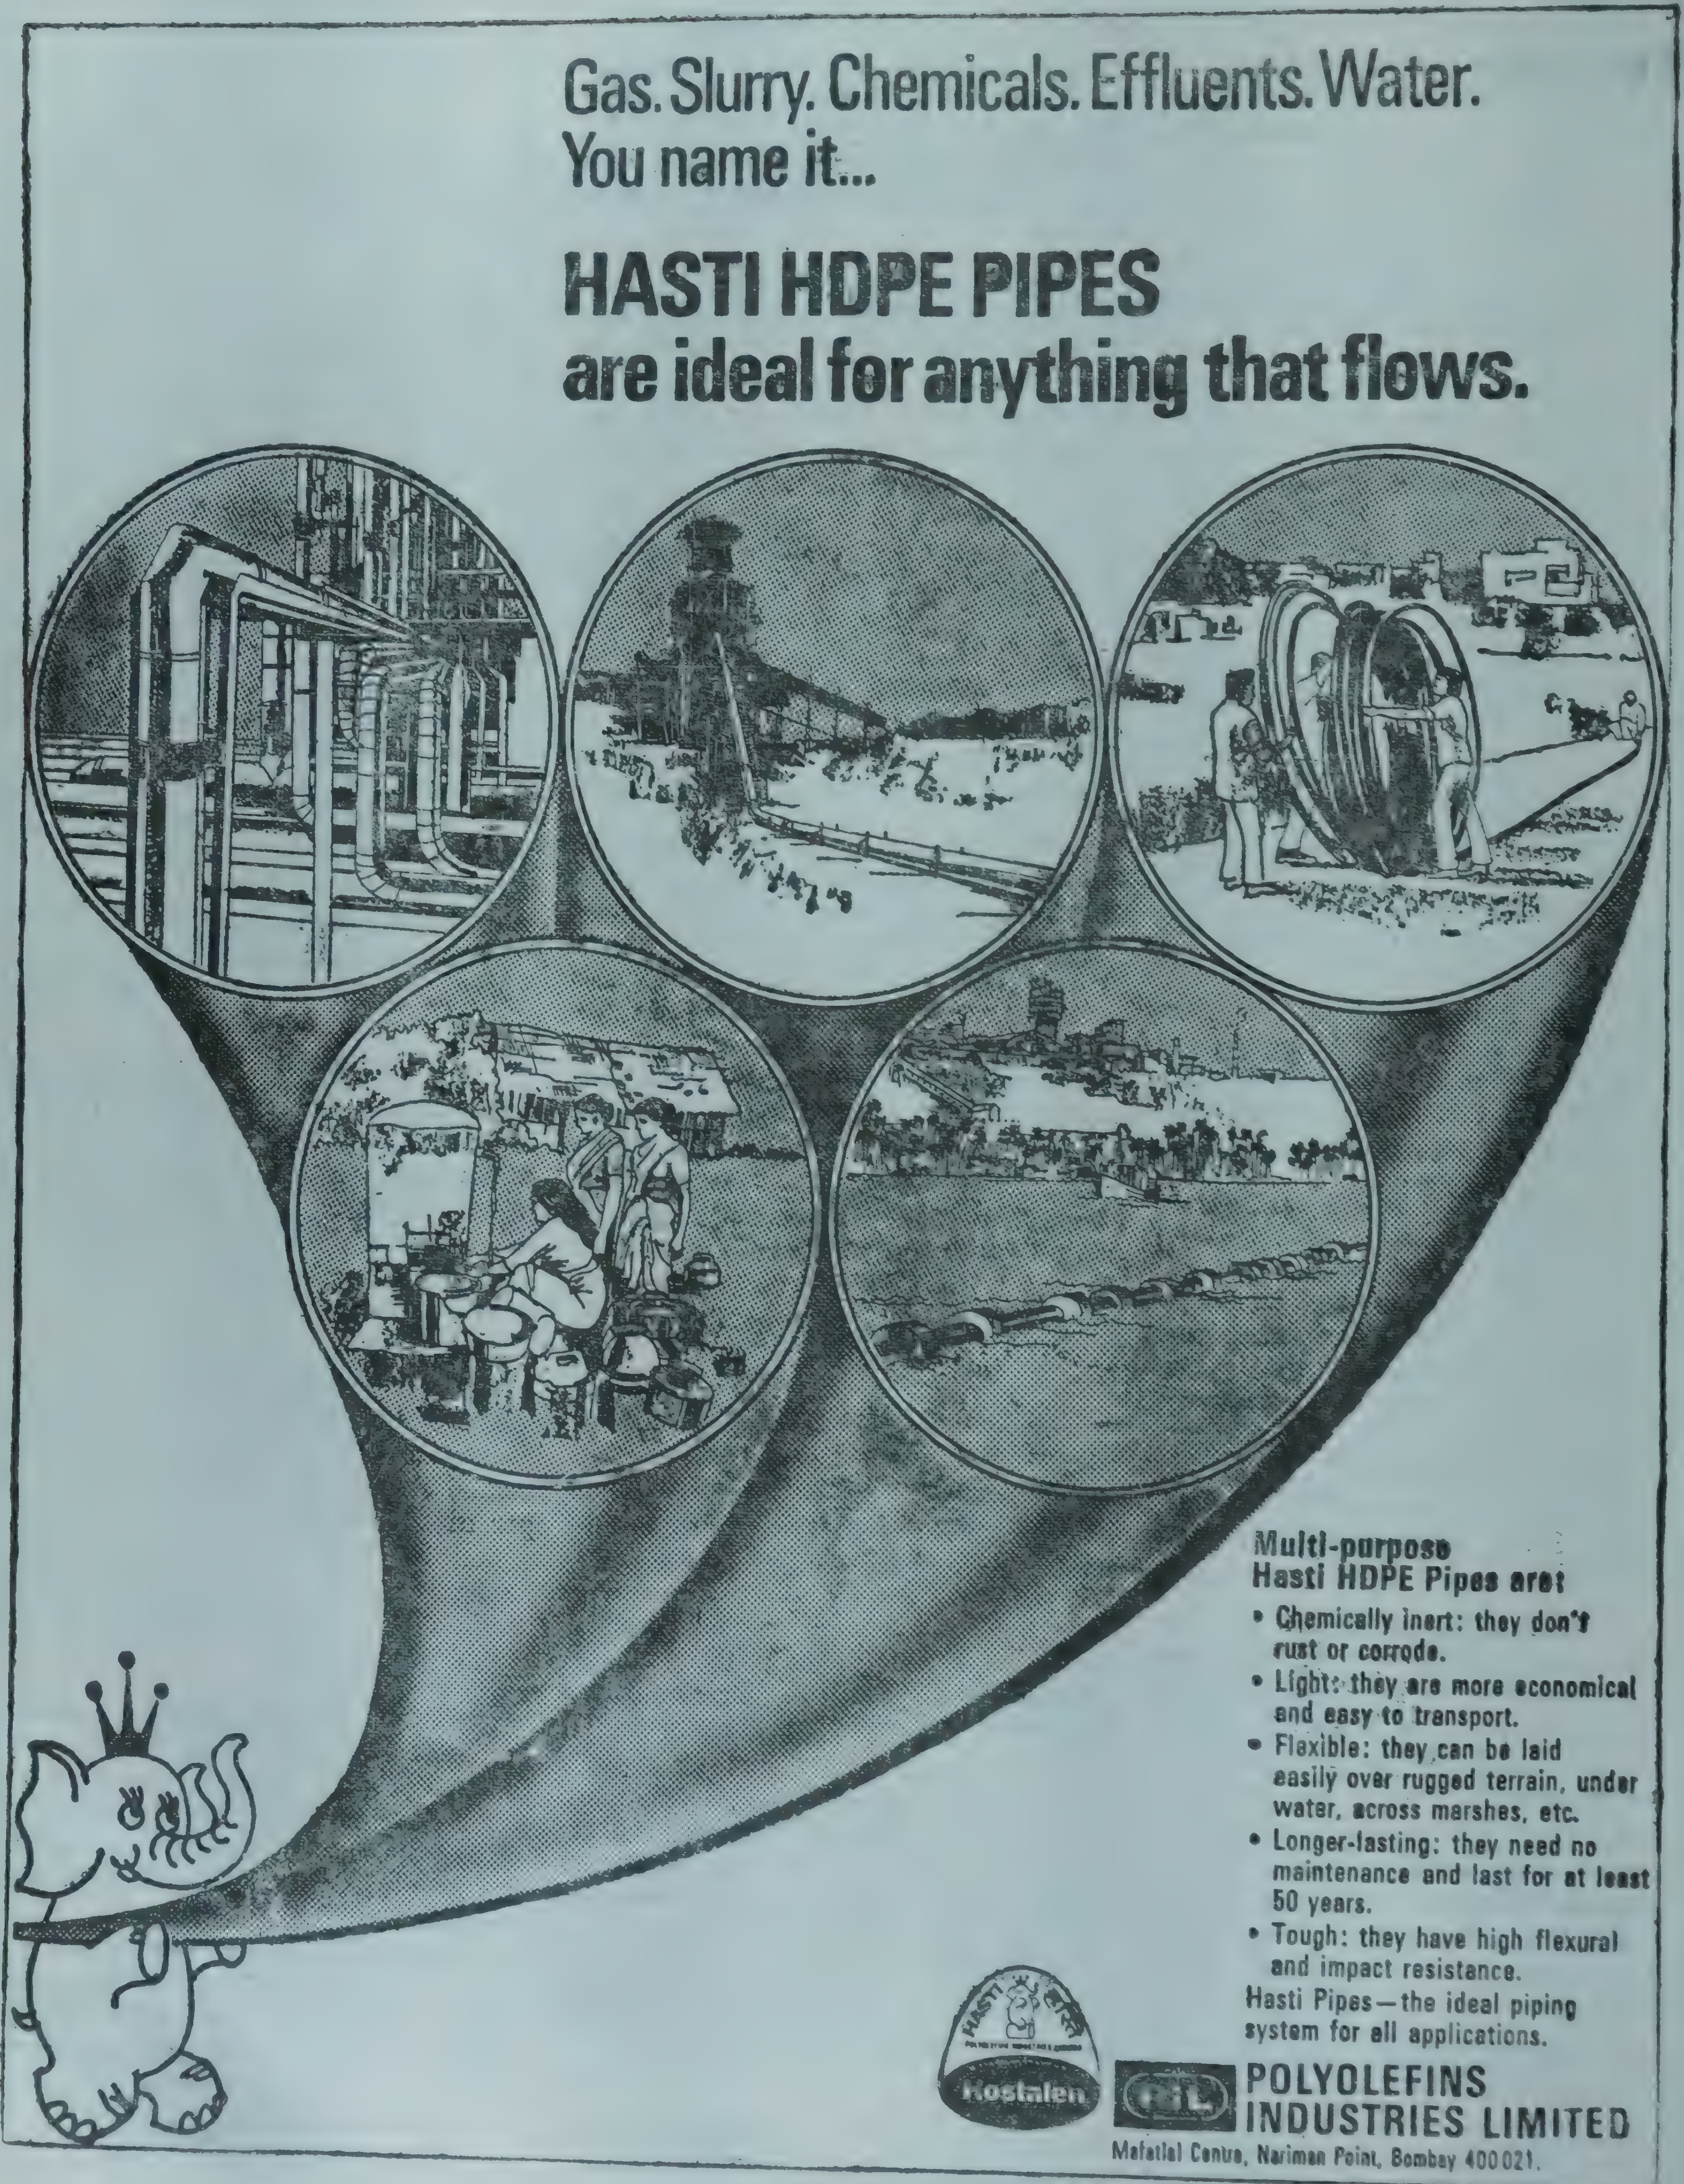
Health is still a neglected sector. Per capita expenditure on health is Rs 5 only. No doubt number of hospitals and dispensaries, health centres and sub-centres has gone up but the quality of services rendered by them is very poor. Most of the hospitals, dispensaries and health centres run short of staff, nurses and doctors. The number of beds is also limited. The quality of diets is not up to mark although the Government has assured to supply better diet. Recently Dr Umeshwar Prasad Varma, Minister for Health and Family Planning, has announced on the floor of the Assembly that the Government would bear the entire cost of treatment of patients admitted to the emergency wards of hospitals.

Mostly patients have to buy medicines from market as the hospitals do not supply them. Not to speak of costly life-saving drugs, even ordinary medicines are not available in hospitals. The health services in the State are in total disarray. It seems there is none to look after them. There are so many complaints that patients often do not get proper care and treatment and as a result they die in many cases. Medicines meant for the patients are sold in the market and consequently poor patients are the worst sufferers.

The problem of housing has aggravated further due to steady increase in population and slower pace of housing construction because of shortage of cement, higher cost of construction materials and difficulties in availability of loan from housing board and other financial institutions.

At present there are 150.27 lakh households in Bihar where as only 98.4 lakh residential houses are available. Then there is a shortage of 52 lakhs residential houses. In urban areas about 25 per cent dwellings are *kutcha* of which 10 per cent have walls and roofs of grass, leaves, reeds. In rural areas, over 70 per cent dwelling units have mud-walls and tile and reeds roofs.

Housing problem in urban areas has become all the more acute due to steady influx of people from rural areas. The Bihar State Housing Board which is in charge of building houses, and flats in 16 towns of the State, has totally failed to cope with the rising demand. Over two lakh applications are pending in different offices of boards for houses and plots. This sharp demand for houses has pushed up the rents to unexpected heights. The problem is such that even for two room flats a rent of over Rs 250 is charged even in small towns.



Gas. Slurry. Chemicals. Effluents. Water.
You name it...

HASTI HDPE PIPES
are ideal for anything that flows.

Multi-purpose
Hasti HDPE Pipes are:

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes—the ideal piping system for all applications.

GUJARAT

Better living for more people

From A SPECIAL CORRESPONDENT

AHMEDABAD

AS in other parts of India, Gujarat has its quota and classification dividing the community into the haves and the have-nots. Gujarat is not among the most economically backward areas even though the long *Adivasi* belt stretching from Saputara to Sabarkantha provides an appaling spectre of poverty and backwardness. An overall view of the State, however, indicates that there has been improvement in the quality of life both in urban and rural areas.

The terylene shirts, flamboyant trousers and transistors are becoming part of the village scene even as the bright dwellings, throngs at cinema houses and packed restaurants provide the changing spectacle in urban areas.

The consumption of foodgrains has increased, indicating better levels of income. There has been even a slight change in the food habits in the sense that consumption of wheat and jowar has increased more than the consumption of inferior grains, indicating thereby that larger number of people have been able to afford better intake. Men and women in tattered clothes are still seen but fewer than 10 years ago, certainly far fewer than 30 years ago. This is true both of the urban and rural areas. Women and children are not yet the privileged class they ought to be but they certainly are better cared for than what they have experienced so far. The vast growing network of health services and social welfare, along with development in other spheres, have put more money in the pockets of people and improved the coverage and quality of services.

The population of Gujarat increased from 2.67 crores in 1971 to 3.40 crores in 1981—an increase of 27 per cent during the decade. In 1981, 2.34 crores of people were living in rural areas and 1.06 crores of people in urban areas.

The total domestic product of the State rose from Rs 2,189 crores in 1970-71 to Rs 5,210 crores in 1979-80 at current prices and from Rs 2,189 crores in 1970-71 to Rs 2,741 crores in 1979-80 at the 1970-71 prices. The per capita income of Gujarat near doubled from Rs 829 in 1970-71 to Rs 1,623, in 1979-80 at current prices but only from Rs 829

A FANTASY IN SAND—DUNES

The Rajasthan Canal is a living fantasy in Sand — dunes.

Symbolic of the courage and determination of the people of the heroic land of Rajasthan, this mighty Project when completed will :—

Convert the uninhabited Desolate Sandy Tracts into lush green fields, farms and orchards.

Will give annual Agricultural production of nearly three million tons.

Provide opportunities for settlement of Millions of people on virgin lands, establishing, New colonies and Mandies with roads, Railways, Educational and Medical facilities etc.

Offer employment to thousands of skilled and unskilled workers and unprecedented prospects to progressive agriculturists and industrial entrepreneurs.

COSTING ABOUT RS. 450 CRORES, THE 649 KMS. LONG CANAL WITH A DISCHARGE OF 18,500 CUSECS WILL BE ONE OF THE WORLD'S LARGEST IRRIGATION SYSTEMS.

Issued by Directorate of Public Relations, Rajasthan.

in 1970-71 to Rs 854, in 1979-80 at the 1970-71 prices. The population living below the poverty line was 121.3 lakhs or 39 per cent of the total population of the State in 1977-78. The proportion of people living below the poverty line was 43.2 per cent for rural areas and 29 per cent for urban areas. However, the proportion of 39 per cent of the population of the State below the poverty line was lower than that of 48.1 per cent for the entire country. It should be noted that the poverty line is defined at Rs 65 per capita per month of consumption expenditure at 1977-78 prices corresponding to the minimum daily calorie requirement of 2,400 per person in rural areas and that of Rs 75 corresponding to the calorie requirement of 2,100 in urban areas.

The State has made considerable progress in the field of industrialisation. The number of registered factories rose from 3,911 in 1960 to 11,059 in 1978 and that of working factories from 3,649 to 9,888. The average number of workers employed in working factories increased from 3.46 lakhs in 1960 to 5.89 lakhs in 1978. The number of small scale units which was 2,169 at the end of 1961 rose to 3,713 at the end of 1979. The number of workers employed in these units increased from 22,427 at end of 1961 to 35,439 at the end of 1979.

Gujarat has about 47.5 lakh hectares of irrigation potential. The extent of irrigation in the State was 7.50 lakh hectares or 7.8 per cent of net sown area in 1961-62, which increased to 12.33 lakh hectares or 12.8 per cent of net sown area in 1976-77. In 1976-77, an area of 7.23 lakh hectares or 58.8 per cent of the total was irrigated by wells and 2.72 lakh hectares or 22.1 per cent by canals. The tubewells irrigated 1.05 lakh hectares or 8.5 per cent of the total and the remaining area was irrigated by othe sources.

The question of drinking water supply to villages continues to be a pressing one in the State of Gujarat. There are 18,275 inhabited villages in the State covering about 72 per cent of the total population in the State, while the remaining 28 per cent of the population is living in 216 towns. Out of the said villages about 3,000 villages were identified as problem villages in the matter of drinking water supply. The amount earmarked as Central assistance for the construction of drinking water supply schemes in 1979-80 and 1980-81 was Rs 127.80 lakhs and Rs 258.50 lakhs respectively. Out of the total 18,275 villages in the State, 9,600 villages, i.e., about 50 per cent of the villages were identified as 'no source' villages. The State Government has given the highest priority to the programme of providing water supply facilities to these villages. Up to the end of 1977-78, 2,916 'no source' villages were covered under Rural Water Supply Programme. It is proposed to cover all the remaining 6,684 'no source' villages by the end of the Sixth Five Year Plan—3,284 villages with piped water supply scheme and 3,400 villages with simple wells or tubewells with hand-pumps.

The proportion of literates to the total population in the State during 1981 was 43.8 per cent as against 35.8 per cent in 1971. The literacy rate for males was 54.5 per cent to the total male population and for females, 32.3 per cent of total female population in 1981 as compared to 46.1 per cent and 24.8 per cent, respectively, in 1971. The number of literates went up from 96 lakhs in 1971 to 149 lakhs in 1981. In

HARYANA

Flourishing villages

From **PRAKASH ANAND**

CHANDIGARH

THE tiny and young State of Haryana, hardly 15 years old, has undergone a dramatic and highly creditable socio-economic transformation as a result of which its per capita income has gone up to Rs 537 (at 1960-61 prices) and Rs 1,776 (at current prices), next only to that of Punjab. When the State was created on November 1, 1966, most of the districts presented a picture of unbearable poverty and prolonged neglect. Much of the land was barren, with the traditionally backward people leading a life of intense hardship.

But both rural and urban areas of the State now show almost all the signs of prosperity and well-being. The sea change in the standard of living, though not as impressive as in the neighbouring and parent State of Punjab, attracts the notice of all visitors. Southern Haryana shares a common border with Delhi, and VIPs are occassionally brought to some of this State's flourishing model villages to show outsiders what perseverance, all-round economic development and systematically planned government assistance can do to make the life of the people, both men and women, happier, brighter and more purposeful.

The level of living of the people of Haryana was bound to be low when the land yield was poor; the means of irrigation were extremely limited, the farming techniques outdated, the people mostly illiterate, ignorant and backward, and the incomes not enough to feed the family. The emergence of Haryana as an independent political entity and the successive governments' drive to improve the lot of the masses have enabled the people of all categories to live better, eat well, earn more through improved farming techniques and educate their children at one or the other of the large network of schools and colleges. Notable improvements have also been effected in their living standards as a result of the rapid development of industries, the establishment of satellite townships in the industrial region — the Faridabad-Sonepat-Ballabgarh complex, Radio sets are

A HELPING HAND TO THE WEAKER SECTIONS

Andhra Pradesh is in the forefront of implementing Prime Minister Smt. Indira Gandhi's 20 Point Economic Programme. As part of the programme, many outstanding schemes for the welfare of the weaker sections are implemented in recent years.

Some highlights of the welfare measures:

❉ Distribution of surplus lands:
74,062 Scheduled Castes—1.05 lakh acres
24,371 Scheduled Tribes—39.9 thousand acres
40, 871 Backward Classes—58.7 thousand acres

❉ Distribution of Government lands:
4,63,672 weaker sections people—8.11 lakh acres

❉ House sites distributed to 12 lakh poor most of them belonging to weaker sections.

❉ 12,701 bonded labourers freed and 5.800 rehabilitated so far.

❉ Enforcement of minimum wages to farm labourers, a majority belonging to the weaker sections.

❉ Reservations for backward classes in recruitment to Government jobs extended for another ten years.

❉ Incentives for inter-caste marriages being implemented

The under privileged in Andhra Pradesh are evincing a sense of enthusiasm today. They look forward to even a better and brighter future.

No. 27 DIPR

becoming common, and so also many consumer articles associated with urban life.

When the villages were isolated, no improvements in the style of living were possible. Now all villages have been linked with metalled roads, ushering in an era of modernisation and sustained progress. The numerous bridges and overbridges have reduced distances and facilitated a quicker tempo of the movement of agricultural produce to the markets. The much larger returns from the sale of farm produce have naturally led to a better standard of living even among petty peasants.

For the most part, the people of Haryana, except the prosperous section of industrialists in Faridabad and Sonepat, still lead a simple life. The average peasant wears the traditional *dhoti* and *kurta*, the typical Haryanvi Jat turban and the old type of *jooti* (shoes). He does not relish urban standards. The vast majority of the people are petty farmers owning small holdings. Even now, there is more of traditionalism than of modernism in the rural people's living styles.

Haryana differs from Punjab in respect of the drinking habit also. While in Punjab drinking is popular in the countryside and those who avoid liquor form a small minority, in Haryana the number of liquor vends in the rural areas is only 270 against about 1,000 in the entire State. The bulk of the country liquor and India-made foreign liquor (IMFL) is consumed in urban and industrial areas, and its consumption in villages, except those situated on the Haryana-Punjab border, is much less. But the total consumption of liquor in the State is increasing; the quota has been raised from 53 lakh proof litres last year to over 70 lakh proof litres in the current year.

Even though the rural population of both Punjab and Haryana consists mostly of Jats, there is a notable difference which explains the contrast in their living styles. The Sikh Jat is happy go lucky, prosperous, fond of meat and drink and robust. Haryana's Hindu Jat is docile, mostly vegetarian and not fond of liquor, but strong and sturdy all the same. Though there has been a distinct improvement in the level of living in Haryana's countryside, the Haryana tradition continues in most places. The clothes worn, except by the educated youth, are of coarse cloth and the shoes are also of the old style. Modernism has not yet affected most districts of this State.

Haryana is also relatively backward in respect of the number of motor vehicles. Most people still prefer the cart and the bus. This is proved by the fact that the number of motor vehicles per lakh of population in Haryana is low (only 460) against Punjab's corresponding figure of 1,292 and Maharashtra's 920. Similarly, the number of motor vehicles per 100 sq km of area in Haryana (1971 census) is 104 against Punjab's figure of 348, the all-India average being 82.

The attractions of urban life and the greater employment opportunities have prompted many people living in the countryside, especially those in the vicinity of towns, to shift, as far as possible, to urban centres. Though the overall growth rate of population growth in Haryana during the 1971-81 decade was only 28.04 per cent, the urban population has grown more than twice as much — 59.16 per cent.

The women of Haryana have throughout played an important role in the *green* and *white* (milk) revolutions in the State; they share the work with men folk in agricultural, pastoral and other work. They are hard-working and active. A Haryanavi woman's work, it is said, is never finished. They are traditionally joyous and brave; they have combined tradition with modernity during the past 15 years or so since Haryana became an independent political entity. They help greatly to keep the State's festivals and festivities alive. By and large, they are comely and vivacious; they are known for songs and dance on every appropriate occasion — welcoming new seasons, marking ploughing and harvesting, and the onset of the rains.

The typical Haryana woman is fond of ornaments. Women belonging to conservative prosperous families often wear silver ornaments weighing about two kg — around the neck, on the arms, on ankles and legs. The upper middle class women in urban areas wear gold bangles and *Gajra* around the wrist.

The consumption of milk in Haryana is perhaps the highest. Although Haryana constitutes only 1 per cent of the country's total geographical area, it possesses 2.79 per cent of India's cattle and buffaloes and contributes 6.5 per cent to the country's milk pail. The daily availability and consumption of milk is a little over 500 grams. Most people are fond of milk and milk products.

According to the National Sample Survey, 45 per cent of the population in the rural areas lived below the poverty line in 1973-74. The position improved by 1978-79 when this percentage fell to 38 per cent. Since the acceleration in the pace of development activities, the linking of over 90 per cent of the villages by metalled roads and the hundred per cent electrification of the villages (in which Haryana took the lead in the country), there has been a distinct improvement in the level of living of the people. The per capita electricity consumption has increased sharply — from 57 units in 1976-77 to 200 units in 1978-79. The living standards has risen almost proportionately.

With the Integrated Rural Development Programme, which has been extended to all blocks in the State, a further improvement following the reduction in the unemployment has been noticed. According to the present plans, over 2.7 lakh more families will be brought above the poverty line by March, 1985.

Thus further improvements in the level of living of the rural people is expected as a result of the special emphasis being laid by the Government on the uplift of the weaker sections, small farmers and farm labourers.

HIMACHAL PRADESH

Small landholders predominate

From A SPECIAL CORRESPONDENT

SIMLA

THE position of Himachal Pradesh as regards the proportion of people below the poverty line could be considered far better when compared with other states of India. According to the official estimates, 10.88 lakh people or 27.2 per cent in Himachal Pradesh were living below the poverty line in 1977-78. Those with per capita monthly consumption expenditure of Rs 65 or less (at 1977-78 prices) corresponding to calorie requirement of 2,400 per person per day in rural areas and per capita monthly consumption expenditure of Rs 75 or less (calorie requirement of 2,100 per person per day) are regarded as people below the poverty line. Out of 10.88 lakh people living below poverty line 10.37 lakhs or 28.1 per cent were in rural areas while only 51,000 or 16.6 per cent were in urban areas. The percentage of population living below the poverty line in Himachal Pradesh at 27.2 was the third lowest among the states after Punjab (15.1 per cent) and Haryana (24.8 per cent).

The net domestic product (at current prices) of Himachal Pradesh between 1970-71 and 1979-80 increased from Rs 232.4 crores to Rs 542.3 crores registering a compound growth rate of 9.9 per cent per annum. During the same period the per capita income (at current prices) went up from Rs 678 to Rs 1,317 or at a rate of 7.7 per cent per annum. However, the comparison of data on State income and per capita income in real terms or at constant prices (1970-71 prices) present a very much different picture. Although, there has been an increase in absolute terms in both real State income and per capita income, the growth rates registered by these two categories under constant prices are much lower than those obtained at current prices. The real State income increased from Rs 232.4 crores in 1970-71 to Rs 283.4 crores in 1979-80 or at a rate of 2.2 per cent per annum. Similarly the real per capita income grew from Rs 678 to Rs 688 showing a growth rate of a meagre 0.2 per cent per annum.

The population of Himachal Pradesh increased from 34.60 lakhs in 1971 to 42.38 lakhs in 1981 showing a growth rate of 22.5 per cent for the decade 1971-81. During this decade there has not been much change in the degree of urbanisation and the State continues to

Commerce Reseach Bureau

be predominantly rural. The urban population of Himachal Pradesh increased from 2.47 lakhs or 7.0 per cent of the total population in 1971 to 3.27 lakhs or 7.7 per cent in 1981. On the other hand, even as the percentage of rural population declined from 93.0 to 92.3 the number of people living in rural areas has gone up from 32.18 lakhs to 39.11 lakhs during this decade. This shows that there has been no significant outflow from rural areas to urban areas like in many other parts of the country. Thus, it appears that a larger number of people are able to find their livelihood in villages.

A bulk of the total work force in Himachal Pradesh continues to live on agriculture. The percentage of cultivators to total work force has gone down from 70.6 in 1971 to 69.4 in 1981. In the case of agricultural labourers there has been substantial decline—from 4.2 per cent in 1971 to 2.9 per cent in 1981.

Unlike many other states, in Himachal Pradesh small landholders is a dominant class both in terms of number and the area. According to the Agricultural Census, there has been no significant change in the shares of small landholders and large farmers in the number and area during the period 1970-71 and 1976-77. In 1970-71 there were 6.09 lakh holdings of which 4.8 lakhs were small (*i.e.,* having land size less than two hectares) and only 6,700 were large holdings (*i.e.,* having area of ten hectares and above). While the small holdings constituted almost 79 per cent of the total holdings, large holdings accounted for barely one per cent. As regards area, the total area under operation was 9.30 lakh hectares of which about 34 per cent was under small holdings and 17 per cent under large holdings. This has not changed much in 1976-77 in that the share of small holdings in number and area was 77 per cent and 34 per cent respectively while that of large holdings was one per cent and 16 per cent respectively.

Under the land ceilings laws in force in the State, an area of 38,021 hectares was declared surplus of which possession was taken of 37,145 hectares so far. However, on the distribution side the performance was very poor as only 1,932 hectares of land was distributed among 6,921 landless people.

During the past several years educational facilities have improved to a large extent. The percentage of literates to total population increased from 32.0 per cent in 1971 to 41.9 per cent in 1981 which is quite higher than the all-India literacy figure of about 36 per cent. In the field of general education the percentage of enrolment to total population in the age group 6-11 year has gone up from 90 in 1974-75 to 110 in 1979 and in the 11-14 age group from 54 to 61. During the Fifth Five Year Plan the system of part-time education at the elementary stage was introduced on an experimental basis and 20,100 children in the age group 6-14 years were enrolled under this system. In an effort to enrol and retain maximum number of children at the elementary stage, various incentives like free text books, free stationery, free clothing, attendance scholarships etc were offered. Under social education, 600 centres were opened for adult education during 1974-78 covering 24,500 adults.

During the Sixth Five Year Plan (1980-85) the main emphasis in the field of general education would be on consolidation rather than expansion, excepting provision of facilities for education of children in the age group 6-14 years. The main direction of development of education during the Plan period would be: accelerating the process of modernisation, development of human resources, increasing access to education and improving the quality of education.

The medical facilities in the State over the years have shown improvement. The number of medical institutions—hospitals, primary health centres, allopathic dispensaries, ayurvedic dispensaries—has gone up from 482 in 1967 to 712 in 1979. Thus the ratio of medical institutions to population in the State has shown an increase from 15 institutions per lakh population in 1967 to 17 institutions per lakh of population in 1979. The number of hospital beds during the same period has risen from 4,649 to 5,524.

As regards provision of safe drinking water to rural areas, there were 11,137 problem villages in the State as on March 31, 1974. By the end of March 1980, 3,322 villages were provided with safe drinking water facilities. During the Sixth Plan, the balance 7,815 problem villages would be covered.

The Integrated Rural Development Programme (IRDP) was started in Himachal Pradesh during 1978-79 in 29 blocks, with the main objective of bringing an appreciable rise in standard of living of the poorest sections of the society as also providing them with fuller employment opportunities. Since October 2, 1980, all the 69 blocks in the State have been covered under the Programme. During the Sixth Five Year Plan (1980-85) about 1.77 lakh families are proposed to be brought under this Programme. These small farmer beneficiaries are given subsidy of 25 per cent whereas marginal farmers and agricultural labourers get 33.3 per cent subsidy. The scheduled caste beneficiaries get 50 per cent assistance as subsidy.

The State Government has introduced a programme for the training of rural youths for self employment. Under this programme, which is a part of the IRDP, youths up to 35 years of age are given training to acquire skills to establish themselves. A minimum of 40 unemployed youths in each block are imparted training in various trades. About 1,800 beneficiaries were undergoing training in various trades during 1980-81. After completion of the training, the youth get loan and subsidy to establish themselves in the vocation of their training.

Madhya Pradesh : Deterioration in rural areas

Concluded from page 43

tricts of the State. Under the nutrition programme, mid-day meals are provided to school going children in the age group 6-14 for 250 days in a year. The special nutrition programme provides for supplementary nutrition to children and expectant and nursing mothers in the tribal areas to the extent of 300 calories and 10-14 grams of protein per day per beneficiary for 300 days in a year. The number of beneficiaries under the programme since then has gone up from three lakh to 14.23 lakhs in 1979-80. During 1980-81, it was proposed to cover about eight lakh beneficiaries each under the mid-day meals programme and the special nutrition programme. By the end of the Sixth Plan the coverage of beneficiaries would be about 12 lakhs under the mid-day meals and 10 lakhs under the special nutrition programme.

Supply of safe drinking water to people is of utmost importance. The problem of inadequate drinking water supply is more acute in villages than in tonnes. Out of 70,883 inhabited villages in Madhya Pradesh, 32,792 villages were declared as problem villages up to March 31, 1980 out of nearly 50,000 villages which were surveyed. Under the minimum needs programme of the Sixth Plan it is proposed to provide safe drinking water to all the remaining problem villages as also to provide at least one public drinking water well in each hamlet.

IF per capita consumption of cereals which stood at about 700 gm per day in Jammu and Kashmir against only 428 gm in the country as a whole in 1977-78 is any guide, the level of living in the State would appear to be quite high in comparison with other states. True, consumption of pulses was as low as 19 gm as against national average of 45 gm, but this was and continues to be more than made up by consumption level in the State of mutton and other non-vegetarian foods. Though there are no reliable statistics available in this regard, yet the significant fact is that at least six lakhs head of sheep and goat are imported into the State annually. In terms of current sale rate of mutton in Srinagar its value comes to Rs 12 crores. On the assumption that mutton worth only Rs 24 crores is currently sold in the State, per capita consumption in this regard works out to Rs 1.33 per day which is of no mean order.

A consumption level of such comparatively high order may be made up substantially by class of people who have become rich overnight by fabulous returns from tourism, horticulture and handicraft sectors. But there can be no denying the fact that these sectors account for bulk of employment in urban and semi-urban areas of the State. Not counting clandestine trading in *charas*, stolen idols and precious skins, the tourism sector alone disperses substantial money in the State. It would indeed be worth studying whether Jammu and Kashmir has any problem of unemployment after taking into account also direct emoluments provided by in agricultural sector and government services. The latter alone employs about 1.60 lakh persons. This means that one out of every 40 persons is employed as such. Taking into account other avenues of income, the ratio would be lesser indicating the fact that sufficient incomes are available to sustain a generally higher level of consumption. This is particularly true of Jammu and Kashmir where the menace of concealment of incomes is widespread. Distortions such as these therefore, tend to lend colour of unreality to official statistics regarding the per capita income etc estimated for Jammu and Kashmir of 1978-79 at Rs 1,145 against national average of Rs 1,249. Statistics apart the most discernible fact about Jammu and Kashmir, particularly Kashmir valley, is that levels of consumption have increased progressively at all levels as if in a deliberate attempt to disapprove the generally accepted principle that expenditure on food etc goes down with rise in incomes. The other important discernible fact about Jammu and Kashmir is that “happy valley” has become more akin to Arab states which are deficient in everything except money.

Levels of living in Jammu and Kashmir would have been higher had not a high rate of population growth eaten substantially into officially calculated rate of growth in per capita income of 3.5 per cent during 1970-71 to 1978-79 against the average of 3.1 per cent. During the 1961-71 decade, the State's population increased by over 2.9 per cent per annum against all-India average of 2.4 per cent. During the decade ending 1981 the State's population is estimated to have increased at the same rate as in last decade. That even the high rate of population growth has not adversely affected the level of consumption is by itself significant.

Important indicators of higher level of living in Jammu and Kashmir are that nobody in the State is houseless and the number of landless agricultural labourers is as low as 3.05 per cent of the total working population of 13.74 lakhs against 26.3 per cent at the national level, according to 1971 figures. This is attributable directly to implementation of revolutionary land reforms in 1951 under which absentee landlords were divested of holdings in excess of 18.75 acres without any compensation and tenants given proprietory rights on holdings rendered surplus. Another dose of land reforms is under implementation for the last three years. It aims at bringing about complete peasant proprietorship of land within the new ceiling limit of 12.5 standard acres. Those expected to benefit include landless labourers.

No official figures are available about the number of people living below the poverty line. But it is conceded that the problem is more acute in urban areas than in rural areas. However, if the number of educated unemployed, essentially an urban phenomenon, is any guide, the level of poverty would not appear to be alarming in the State when compared with other parts of the country. A total of about 53,000 unemployed persons occurring on live register in June 1980 included over 37,000 educated persons. Besides refusing to open new degree colleges, the State Government has been curbing additions to ranks of job seekers by diverting young boys and girls to trades like carpet weaving, etc, even before they complete primary education.

However, if the 1981 census figures can be relied upon, the State appears to have made impressive improvement of 41 per cent in the level of literacy during the last decade. Male literacy during this period increased from 26.7 to 35.49 per cent. Female literacy rose faster by 70 per cent from 9.28 to 15.28 per cent. In the words of the State census director, Mr A. H. Khan, Jammu and Kashmir, however, remains “a decade behind” national average of 35.03 per cent in 1981. It remains to be seen when the impressive increases in female literacy during the last decade has also been shared by rural areas where literacy level in 1971 was only five per cent. The picture will become rather clear when detailed figures about the 1981 census are released for Jammu and Kashmir. However, it appears certain that improvement in literacy continues to be a predominantly urban phenomenon.

Exporters, entrepreneurs !

CASH IN ON A MONEY-SPINNER

CARDAMOM OILS, EXTRACTS, OLEORESINS.

Exporters, entrepreneurs!
Cash in on a money-spinners:
Cardamom oils, extracts, oleoresins.
Indian cardamom is pure gold. And its products even more so.
There is a vast market in USA, Canada, Germany, France and of course in India for cardamom oils, extracts and oleoresins as a flavouring agent for a variety of products—foods, cosmetics, toileteries and medicines. And the demand is growing by the day.
India is the largest producer of cardamom. And Indian cardamom is the first choice of flavour technologists everywhere.
Raw material supply is sufficient.
Quality excellent. Price just right.
Yield high. What more can you ask for?
So there it is. A whole new world of profitable opportunities. In the production and use of cardamom oils, extracts and oleoresins. And in their export. Take your pick.
If you need more information or any assistance, you are most welcome to contact us.

KARNATAKA

Progressive improvement

From OUR SPECIAL CORRESPONDENT

BANGALORE

IF the five year plans are recognised as instruments of change and development and that Karnataka has registered an annual growth rate of around six per cent (short-run in real terms between 1970-71 and 1974-75) in its economy, considered one of the highest for the country, this growth can be taken as a measure of the progressive upgradation of the general levels of living of the people. It has been acknowledged that this growth had further strengthened the agricultural, industrial, infrastuctural and institutional base of the State. But certain problems like unemployment and underemployment, low efficiency in certain sectors, underutilisation of capacity and resources, uneven spread of growth benefits and shortfalls in some of the minimum needs of life and nutritional intake continue to persist. There was still heavy reliance on the agricultural sector for employment and income generation.

An inbuilt inhibition that afflicts development and neutralises its gains, from time to time, is the incidence of drought, almost cyclic, bringing distress to large mass of people, particularly, in the primary sector. The irrigation back-up, though having risen to 20 per cent of the total area under cultivation, is still considered low to be of much help in stabilising the agricultural economy.

The State's development since Independence is two-phased, comprising the period between 1948-1956 and the post-1956 period, after the State's reorganisation, bringing in its train new areas from the erstwhile Bombay, Madras, Hyderabad, and Coorg states, with varying degrees of development, not comparable to the better living standards enjoyed by the erstwhile princely state of Mysore. In fact, the striking feature of the new State's career became the chronic regional imbalances in development and living levels. An overview of the scenario should necessarily take these factors into account over the last three decades.

The net state domestic product (state income), at current prices, is expected to increase to Rs 4,796 crores in 1980-81 as against Rs 4,393 crores in the previous year, representing a 9.2 per cent increase. But, at constant prices, it is expected to decrease from Rs 2,503 crores, in 1979-80, to Rs 2,374

Some selected indicators of levels of living: Karnataka

Commerce Research Bureau

crores, in 1980-81 or a percentage decrease of 5.2. This trend is attributed o the decline in agricultural producion, because of the widespread drought conditions.

The per capita income, at current prices, works out to Rs 1,357, in 1980-81, as against Rs 1,267, in the previous year. It showed at constant prices, a decrease from Rs 722 to Rs 672. Agriculture continues to contribute a major hare to state income. At current prices, he costribution of the primary sector vas 52.36 per cent, in 1979-80 while hat of the secondary and the tertiary ectors was 21.13 per cent and 26.5 per cent, respectively.

There have been ups and downs in he reckoning. The net domestic product, at current prices, in 1978-79, was Rs 3,866 crores while the per capita ncome was Rs 1,136. The corresponding national income and per capita income, at current prices, was of the order of Rs 81,228 crores and Rs 1,267. While the rate of growth of per capita tate income, at constant prices, between 1970-71 and 1978-79, in Karnaaka, was 0.69 per cent, that of all ndia was 1.87 per cent. During 1978-79, out of the total state domestic product, as much as 46.4 per cent was rom agriculture and the animal husbanlry sector, 13 per cent from the manuacturing sector, the corresponding allndia figures being 37.5 per cent and 6.8 per cent, respectively.

Another trend observed is the fall n the share of area under cereals from 0 per cent to 50 per cent, increase in he share of the area under pulses from 4 per cent to 16 per cent and of the hare of the area under oilseeds from 13 per cent to 16 per cent, indicative of beter coverage of nutritional requirements f the growing population. The per apita availability for consumption per nnum of cereals had increased from 73 kg in 1955-56 to 188 kg in 1979-0, as against the nutritional requirement of 173 kg. Similarly, in respect f sugar and gur, the per capita availbility had risen from eight kg a year 31 kg, though the State was not in n equally advantageous position in espect of pulses and edible oil.

The overall literacy rate increased om 25.4 per cent in 1961 to 31.5 per ent in 1971. The 1981 census reveals jump in the figure to 38.14 per cent ith a break-up of 48.61 per cent for ales and 27.83 per cent for females.

The state of compulsory primary lucation, covering the 6-10 year age roup, has continued to cause anxiety. n spite of the best efforts and incentis, it has been admitted, the enrolent of children in classes I to IV was a little over 35 lakhs, which on paper, means an enrolment percentage of 96. But this number includes children outside the compulsory age group who formed about 10 per cent of the total. It meant that 14 per cent of children in the 6-10 year age group are still outside schools. In classes V to VII, the enrolment has been 46 per cent.

The problem of educated manpower has assumed serious proportions. The stock of all types of graduates was likely to be around five and half lakhs by 1985. Assuming that the present rate of unemployment would hold good in 1984-85, the graduate unemployment, at the rate of more than five per cent a year, was expected to touch 60,000 or more.

The demographic perspective is also noteworthy for employment prospects. According to the 1981 census, the population of the State is put at 370.43 lakhs, made up of 188.69 lakh males and 181.74 lakh females, representing an increase of over 57 per cent over the 1961 figures. In terms of policy implications, it means need for reduction in the birth rate it is realised, from 34 per cent in 1971-75 to 25.1 during 1981-85 and to 20.5 per cent during 1986-90. It could be tackled, among other things, by improving the living standards of the economically weaker sections and by education regarding the benefits of a small family.

According to the 1971 figures of occupational classification, out of tl total population of 292.99 lakhs, 101.79 lakhs or 34.75 per cent constituted the working population, dependents forming 65.26 per cent of the total population. Out of the total work force 26.7 per cent constituted agricultural labourers, 4.12 per cent were those in the livestock, forestry, fishing, and plantations, and 10.20 per cent constituted industrial workers.

Growth rate of labour force is expected to be 2.5 per cent per annum, during 1980-85 and slightly less thereafter until 1990. In absolute terms, it is pointed out, the responsibility of the State lay in creating employment opportunities for about 160 lakhs by 1990 as against the present work force of about 112 lakhs. The expected labour force in the rural segment was 117 lakhs while it was 43 lakhs for the urban sector.

The live registers maintained by employment exchanges showed that at the end of 1977, the number of unemployed was of the order of 4.98 lakh of which 2.98 lakh were educated unemployed. The figure rose to 5.82 lakh by the end of 1980 of whom 3.77 lakh were educated unemployed.

As for the health services available, the latest position was there were 1,869 hospitals and institutions with a bed strength of 34,588. The institution-population ratio and the bed strength population ratio is put at 1:19,420 and 1:1,049, respectively for the 1980 level of population. The bed strength in 1969-70 was about 24,800.

According to the inter-State economic indicators, brought out by the Planning Department, in May, 1980, the physical quality of life figures put infant mortality in Karnataka at 100.27 for 1000 live births: life expectancy at birth at 55.62, and the physical quality of life index at 37.6. Karnataka ranks sixth in the country, after Kerala, the Punjab, Maharashtra, Haryana, and West Bengal.

The per capita electric energy consumption figures indicate a rise from 82 units to 158 units between 1969-70 and 1979-80. Sixtyone per cent of the villages had been electrified as against 35 per cent 10 years ago.

According to the all India Rural Debt and Investment Survey conducted by the Reserve Bank, in 1971-72, the rural indebtedness per reporting household was assessed at Rs 1,515 in Karnataka as against Rs 1,167 for all India.

According to the special studies division of the Planning Department, the population below poverty line is estimated (based on both private consumption expenditure and consumption of public goods) at 48.8 per cent rural and 51.3 per cent urban for 1970-71.

It has been proposed to bring about redistribution of consumption expenditure in such a way that the lower rural class got 38 per cent of rural private consumption expenditure and lower urban class 47 per cent of urban private consumption expenditure by 1987-88.

It would be worthwhile going into the progressive impoverishment of both the urban working class at the lower economic strata and the mass of the weaker sections in the rural segments exposed to the growing incidence of liquor consumption. The recent unprecedented illicit liquor tragedy in Bangalore and its socio-economic dimensions are a pointer. In the public debates that have raged, the darker aspect of public policy highlighted has been the hunger on the part of the government for maximising the 'tainted' excise revenue and its implications for the growth of illicit distillation by the underworld and the deleterious effects on the health and the domestic budget of the victims.

KERALA

Apparent prosperity in midst of poverty

From G. S. KARTHA

TRIVANDRUM

SINCE the formation of Kerala, comprising the princely states of Travancore and Cochin, and the Malabar district of the erstwhile Madras State 25 years ago, successive governments have generally followed a welfare approach towards development. The spread of education and health services started by the princely states was intensified and extended to the comparatively backward Malabar area. The birth of the new state of Kerala also coincided with the coming to power of political parties with progressive ideologies, and those governments gave sympathetic consideration to the needs and demands of organised sections of the people in different spheres.

A full picture with statistics of the progress made in the area now known as Kerala since Independence is not readily available, due to various reasons, because different policies and programmes were followed in the princely states of Travancore and Cochin until the State of Kerala was formed. However, over the years, several welfare measures for the various sections of the people were initiated as a result of which considerable progress was achieved in education, health services, literacy, and employment, and in the sphere of education and literacy Kerala stands foremost in the country. But proper official statistics to highlight the changes that have taken place since Independence are not easily available, covering the three decades.

Rapid strides were made in industry, agriculture, and the social services, even though the progress was not entirely satisfactory. Though the successive governments indulged in tall declarations of policies, the performance remained comparatively poor, because of the too-much of involvement in party politics by the rulers, and the lack of adequate support and co-operation from the Centre — the more so when non-Congress governments were in office in the State.

Low economic growth in the context of a growing population and the turnout of educated people every year from schools and colleges, has aggravated the already acute problem of unemployment, and has resulted in low family incomes and correspondingly low private consumption even as regards essential goods.

TRIKAYA-MT 20·81

A study conducted in the State, adopting poverty norms suggested by the Planning Commission, (minimum nutritional requirements of 2,400 calories per person per day in rural areas and 2,100 calories per person per day in urban areas) revealed that about 68 per cent of the people in the rural areas and 78 per cent in urban areas were living below the poverty line. Though there is poverty, it is doubtful if there is actual starvation — instances of people dying due to starvation. If there were such conditions, the highly class-conscious, militant, and irrepressible people would have risen in revolt, especially when the State is a stronghold of the Marxists, and parties of other leftist ideologies. As a professor said, "the much published revolution would have started from Kerala".

To one who visits the State, it would be difficult to appreciate that there are large sections of people below the poverty line. That is a peculiarity of Kerala. Everywhere, even in the forestlands, one can see people clad in neat dress, and polyester and terylene are becoming very popular. A friend of this correspondent, who is a top man in the foreign service, commented: "When we were students in the years 1939-43 or even a few years later, we could not afford wrist watches. Even slippers and shoes were considered a luxury, and very few people were found wearing them. There were men moving about without shirts. Now just take a look around in our home state. Transistors, radios, and posh dress found everywhere, even in the so-called slum areas. Do you think there is poverty, atleast to outward appearance?"

Surely there is poverty; but not much of starvation. People have something or other to live on, it appears. It may also be true that all may not be getting nourishing and sustaining food. But people even in the slum areas could be found carrying transistor-radios, and clad in foreign clothes and using foreign umbrellas. Probably they want to put up a show of affluence and fashion, covering up their poverty.

The unemployment situation in Kerala has become explosive. According to a recent survey (1978) of the State Directorate of Economics and Statistics, 11.5 lakh persons are totally unemployed. In 1980, this rose to 12.96 lakhs, approximately. More than half of them are educated.

Employment opportunities are yet to come in a big way. As the employees are found to be militant and organised, employers are cautious to take in more and add to their worries and problems.

In Kerala the educational sector has, from the very early days before Independence, recorded a phenomenal growth. There has been steady growth in the number of schools and colleges. At present there are 1,680 high schools, 2,739 upper primary schools, 6,970 lower primary schools, with a total strength of 55.8 lakh students and 1.76 lakh teachers. Kerala is ahead of other states in educational achievements. About 38 per cent of the State budget is spent on the maintenance and development of education in Kerala while the all-India percentage is only 23. Though the State has marched ahead of other states in the field of literacy and general education, at the school level, the pace of progress in higher education has been comparatively slow. The progress of university education gained momentum only in the recent past. At present there are 133 arts and science colleges in the State, with a total student strength of 1.8 lakhs. There are three universities in the State, namely, Kerala University, Cochin University, and Calicut University, in addition there is an Agricultural University also.

Quantitatively, there is commendable progress in the State, but there has been indiscipline and chaos in the campus since the last few years. After Independence, there has been an increase in the indiscipline in the student community, and to the rulers who are politicians, the student community has become a problem. Mr R. Sanker, the late chief minister, once wondered why the State should waste its funds to mass-produce "poor quality of students" who may not become the desirable type of citizens in the future. Mr M. P. Manmathan, educationist and Sarvodaya leader, feels sorry that the State could not so far give shape to "democratic culture" though its students.

Health services in Kerala are of a high standard in comparison with many other states in India. However, the health care system in the State is still underdeveloped. The classification of medical institutions is neither service-oriented nor based on the concept of integrated medical and health care. The number and distribution of institutions is not need-based, which leads to the concentration of medical institutions in the urban areas resulting in widening regional disparities. There is demand for more institutions, inpatient facilities, and better quality medical personnel. Though crores are spent on the hospitals and medicines, the public is benefited only to a negligible extent because of the poor facilities and services and attention they get in the government hospitals. Corruption is the main stumbling block. Treatment has become costly. Even the Ayurvedic system of medicine which used to be cheaper in the past has now become costlier than allopathy. However, there has been marked advancement in the field of health services since Independence.

The state income for Kerala for 1978-79, according to quick estimates by the State Bureau of Economics and Statistics is Rs 2,618 crores at current prices, recording an increase of 8.9 per cent over the previous year. The per capita state income estimated at Rs 1,056 recorded and increase of 7 per cent over the previous year's estimate of Rs 987 at current prices.

Now, there has been a rise in the income of all sections of employees in the State. Even the unemployed are being given a dole which is mostly used by the beneficiaries for luxuries, with a small share reaching their home. Many families have more than one earning member, and this adds to their prosperity. Compared to the lower categories of employees, like the headload workers, and construction workers, the monthly income of an average middle class family remains fixed and comparatively low. For instance a headload worker gets around Rs 80 per day. The lure for unnecessary expenses increases with the increase in income. A good section of the employees actually carry home only a small portion of their salary or wages, because of this. In general, the lure for luxurious living has become very common, and quite many live beyond their means. The best instance of squandering money is provided by the relatives of persons working in the Gulf countries. To a large extent they have been responsible for the shooting up of prices of land, consumer goods, and cost of services. This has brought considerable hardship to the limited income people at the lower levels.

Amidst the apparent prosperity of the people, there are vast sections of people who still live in want and misery even in the towns and cities. As a political commentator observed: "The standard of living of the people has gone up; but their quality of living is going down".

When you need a Bank that can help you... advise you... guide you... in all your activities
EXPORT

NEW BANK provides you a most comprehensive banking service. If you are interested in deposits we have several Saving Schemes to meet your needs. If you are seeking loans we have schemes to help people engaged in industry, agriculture, self-employment and those belonging to weaker sections. MADHYA PRADESH

Deterioration in rural areas

From OUR SPECIAL CORRESPONDENT

BHOPAL

EVEN a cursory glance at the data available on Madhya Pradesh's contribution to the GNP over the years and changes in per capita income levels, shows that thousands of crores of rupees poured in development programmes have achieved precious little towards raising living standards of the people.

Earliest figures with Bureau of Statistics here are of 1961 and latest computed information relates to 1978-79. Statistics on net state domestic product at current prices in crores, per capita income and percentage of increase at constant prices are as follows: For 1970-71: Rs 2,003.2, Rs 488.6, nil and nil. For 1974-75: Rs 3,762.8, Rs 818.9, minus 1 and minus 3.5. For 1978-79: Rs 4,306, Rs 854, minus 5.3, minus 7.3. It is a painful fact that both the domestic product and per capita income in Madhya Pradesh have steadily declined during the last decade

The ratio of major component of domestic product seems to have remained unchanged. The primary sector of agriculture continues to contribute nearly 60 per cent. Actually the decline in this sector (minus 9 per cent of growth over 1970) has mainly contributed towards the decline in national product. The other sectors have achieved only marginal progress during the 70s.

It is easy to surmise that living levels in rural areas have deteriorated over the years. In 1961 the state population was 3.23 crores out of which 2.77 crores lived in the villages. Distribution of population between rural and urban areas remained almost the same in 1981 when the population has grown to 5.21 crores. Any sizable exodus of population to cities is not evident in this state. The plight of the rural poor can, therefore, be easily imagined.

Facilities for education and health care have certainly increased during the last two decades in the State. Literacy has increased from 17.13 per cent in 1961 to 27.82 today. Most of the increase is in the primary stage, which means there are now more literates in rural

A year of all Round Development

Facilities to Labourers

The Uttar Pradesh Government has under taken effective measures for the well-being of labourers in oder to seek their maximum co-operation for increasing production and maintain industrial peace.

Some of steps taken by the State Government for the welfare of labourers.

- For the first time protection granted to forest labourers under minimum wages act.
- Enhancement of wages of sugar industry labourers from January, 1981.
- Revision of minimum wages of labourers engaged in agriculture, bidi industry, silk embroidery, woollen blankets manufacturing units, public transport and khandsari units.
- Campaign launched to encourage workers participation in management of government industrial units engaging 200 or more labourers.
- Relief assured to labourers through improvement in industrial peace.
- A thirteen point programme for labourers engaged for sweeping; Wages of labourers of local bodies engaged for sweeping declared first charge.
- The state seeks the co-operation in maintaining industrial harmony.

Issued by Information and Public Relations Department, Uttar Pradesh.

areas. However, because of the slow growth of industries in the State and consequent lack of employment opportunities this growth in literacy has not meant more earning but it certainly has changed the pattern of spending in villages. More money is being spent on fine clothes now than on food. This presents a show of prosperity that is not real.

During the period 1970-71 to 1979-80, the net domestic product (at current prices) of Madhya Pradesh increased from Rs 2,002 crores to Rs 4,262 crores recording a rise of about 112 per cent (or 8.8 per cent per annum). The per capita income (at current prices) of the State also went up during the same period from Rs 488 to Rs 828 recording a much lower increase of about 70 per cent (or about six per cent per annum) than that for the State income.

However, while discussing the standard of living of the people in Madhya Pradesh it would be better to consider the State income and per capita income in real terms or at constant prices. Between 1970-71 and 1979-80, the net domestic product of the State actually declined from Rs 2,002 crores to Rs 1,891 crores or by 5.5 per cent. In the case of real per capita income (*i.e.*, at 1970-71 prices), it also declined from Rs 488 to Rs 367 or as much as by 24.8 per cent. Although the primary sector of agriculture and allied activities continues to be the largest contributor of State income, it is the decline in income from this sector, both in absolute and percentage terms, that has resulted in a decline in the overall State income in real terms. The other sectors have shown marginal increase. The decline in incomes could largely be attributed to the tremendous rise in population of over 25 per cent during the 1971-81 decade (the population went up from 4.2 crores in 1971 to 5.2 crores in 1981).

In 1977-78 more than half the population or 57.73 per cent to be exact was below the poverty line in the State. Those with per capita monthly consumption expenditure of Rs 65 (at 1977-78 prices) corresponding to a minimum daily calorie requirement of 2,400 per person in rural areas and the per capita per month consumption expenditure of Rs 75 corresponding to calorie requirement of 2,100 per person in urban areas are regarded as people below the poverty line. In the villages around 60 per cent lived below the line while of the urban people only 48 per cent were the poor. In Rajasthan, which is as backward as Madhya Pradesh, the grossly poor comprised only 33.76 per cent of the population in 1961 and they are distributed evenly between the towns and villages.

Over the years there has been some improvement in the degree of urbanisation. In 1961 about 2.8 crore people or 85.7 per cent were living in villages and about 40 lakhs or about 14.3 per cent in towns. Although the percentage of urban population has gone up to 20.3 in 1981 and that of rural population has gone down to 79.7, the number of people living in villages has increased to 4.1 crores.

The growing population in villages has to live on almost the same piece of land. There may not be unemployment in the landed class but underemployment grows with the years. Figures for unemployed landless labourers are not readily available. The number of registered unemployed in exchanges were over 4,24,000 in 1979 while those placed into employment were only 33,000 that year. The number of those employed in industries was just over three lakhs.

Over the years there has been very little change in the size of land holdings in Madhya Pradesh. According to the Agricultural Census, in 1970-71 there were in all 53 lakh land holdings of which 25.7 lakh holdings or 48.6 per cent were small (*i.e.*, having area less than two hectares). Out of a total operated area of 211.9 lakh hectares, these small holdings accounted for 20.3 lakh hectares or about ten per cent. On the other hand, large holdings (*i.e.*, ten hectares and above) numbering only 4,917 accounted for as much as 41 per cent of the total operated area. By 1976-77, the total number of holdings increased to 60.6 lakhs and the operated area to 216.9 lakh hectares. The share of small holdings in the number increased to about 51 per cent and in the operated area to 11 per cent. The share of large holdings, in the total operated area, on the other hand, has gone down to 36 per cent. This shows that there has been some impact on the land holdings on account of the distribution of surplus land among the landless.

Under the land ceiling laws 2.4 lakh cases were registered of which only 2.477 cases were pending at the end of October 1980. So far, 1.34 lakh hectares of land has been declared surplus. Out of this, possession has been taken of 82,437 hectares of land of which 46,526 hectares of land has been distributed. Under an ordinance promulgated in June 1980, the State Government conferred ownership rights on landless villagers in respect of homestead land which was expected to benefit about ten lakh poor people.

Facilities for education and health care have certainly increased during the last two decades. Literacy has increased from 17.13 per cent in 1961 to 27.82 per cent in 1981. Most of the increase is in the primary stage which means there are now more literates in rural areas.

However, because of the slow growth of industries in the State and consequent lack of employment opportunities this growth in literacy has not meant more earning but it certainly has changed the pattern of spending in villages. More money is being spent on fine clothes now than on food. This presents a show of prosperity that is not real.

The fact remains that even in 1981, 3.76 crores people continue to be illiterate. The enrolment of students in the age group 6-14 was 60 per cent of the total population in that age group in 1978-79 and 29 per cent in the age group 11-14. The corresponding all-India figures were 85 per cent, 38 per cent respectively.

During the Sixth Five Year Plan (1980-85) it is proposed to achieve 90 per cent student enrolment in 6-11 age group and 45 per cent in 11-14 age group. The main emphasis of the universalisation of elementary education during the Plan would be to cover more girl students as also students from the scheduled castes and scheduled tribes communities. There is a wide gap between the enrolment of boys and girls. During 1979-80, while the enrolment of boys was 82 per cent in age group 6-11 and 45 per cent in age group 11-14, the enrolment for girls was 42 per cent and 15 per cent respectively. Same is true of scheduled castes and scheduled tribes where the respective percentages were : 62 (6-11 age group) and 24 (11-14 age group) and 47 (6-11 age group) and 12 (11-14 age group).

Malnutrition among the people, particularly in tribals, is a serious problem. Scheduled tribes account for about 24 per cent of the States population. The disruption of the ecological balance in tribal areas of Madhya Pradesh has adversely affected their nutritional status. The change in the vegetation of the area, growing pressure of population, new uses of minor forest produce have affected the diet of the tribal people. To combat the problem of malnutrition and under-nourishment the nutrition programme in the State was first launched in 1966 in the tribal dis-

MAHARASHTRA

Industry, agriculture improve conditions

By A SPECIAL CORRESPONDENT

BOMBAY

MAHARASHTRA has made significant strides on agricultural and industrial fronts and has consequently improved the living conditions of the people as compared to the overall performance at the national level. It is not as if all the areas have shared equally the benefits of development but where industrialisation has not made a good headway cash crops like sugarcane and cotton have contributed their share in improving the standard of living. Yet 47.7 per cent of the population was estimated be living below poverty line.

Per capita income at the current price level stood at Rs 1,903 as against the national figure of Rs 1,379. This growth is largely due to accelerated industrial activity and higher return in agricultural production including cash crops such as cotton, sugarcane etc.

In the industrial field, the annual turnover is about Rs 5,000 crores. The cotton and sugarcane yield about Rs 1,000 crores. Besides, agro-industries fetch another Rs 1,000 crores. All these together have helped the population in the State to better living conditions than in many other states in the country. The industrial prosperity has been achieved mainly because of better infrastructural facilities, productivity of labour and entrepreneurship.

Organised manufacturing activity in Maharashtra plays an important role. Though the population of the State is only nine per cent of the country's population, the State shares about 25 per cent of the income generated in the organised manufacturing activity in the country. However, this activity is largely concentrated in Greater Bombay, Thane and Pune districts which account for 24 per cent of the State's population. According to the latest annual survey of industries, these three districts account for about 83 per cent of Maharashtra's income generated in this sector.

The employment in factories increased at an average annual rate of 2.43 per cent since the formation of the State in 1961 till 1979.

Maharashtra's net domestic production by industrial origin at the current prices was Rs 11,323.6 crores at the end of 1980 as against Rs 1,597.4 crores in 1960-61—a phenomenal increase since the formation of the State.

Of these, primary products such as agriculture, forestry and logging, fishing, mining, quarrying account for Rs 3,383.3 crores as against Rs 668.3 crores in 1960-61. Secondary product (manufacturing, construction, electricity, gas and water supply) Rs 3,721.3 crores in 1980 compared to Rs 422.1 crores in 1960-61; and transport, storage, communication, trade, hotels, restaurants, banking and insurance, real estate and ownership of buildings, business services, public administration and other services accounted for Rs 4,219.0 crores in 1980. The figure in 1961 was Rs 507.0 crores.

Significantly, the contribution of secondary industries such as manufacturing units to the domestic product shot up by six per cent from 26.4 per cent in 1960-61 to 32.9 per cent in 1980, while primary product has gone down from 41.9 per cent in 1960-61 to 29.9 per cent in 1980.

The second economic census of 1980, which covered all non-agricultural enterprises and agricultural enterprises engaged in livestock production, agricultural services, hunting, trapping game propogation, forestry, logging and fishing but not enterprises engaged in crop production and plantation revealed that there were about 18 lakh non-agricultural enterprises in the State engaging 65.36 lakh persons of which 43.28 lakh were hired workers. Nearly 32 per cent (5.74 lakh) non-agricultural enterprises had at least one hired worker on a fairly regular basis. Nearly half of the non-agricultural enterprises and 70 per cent of their employment in the State were in the urban areas.

Maharashtra accounted for about 12 per cent of all-India installed capacity of electricity as on March 31, 1980, and it is nearly 15 per cent and about 16 per cent of all-India output and consumption of electricity in 1979-80. Compared with the installed capacity of 3,858 mw, derated capacity was 3,106 mw as on March 31, 1980.

The number of towns and villages electrified in the State increased to 26,575 by March 31, 1980 from 24,416 in 1979 and further to 27,820 by the end of December 1980. By the end of December 1980, 74.6 per cent of villages and 88.2 per cent of rural population had access to electric supply. The number of agricultural pumps energised up to December 1980 was 48,665 bringing the total to 6.46 lakh pump-sets—an increase of 8.14 per cent during nine months from April 1980 to December 1980.

As for the agricultural sector, cash crops like sugarcane and cotton have been playing a significant role in the prosperity in rural Maharashtra—thanks to the co-operative movement and the State Government's scheme for monopoly purchase of cotton.

The area under sugarcane during 1978-79 was 2.97 lakh hectares. Out of which 2.44 lakh hectares were harvested, giving a total production of 224.82 lakh tonnes of sugarcane with an average yield of 92.10 tonnes/per hectare. During 1980-81, the sugarcane area would have increased to three lakh hectares of which 2.48 lakh hectares would be harvested giving a total production of 235 lakh tonnes of sugarcane.

The State's performance in sugarcane production has naturally a bearing on sugar factories in the co-operative sector. Thirtysix years ago, the late Padmashri Dr Vithalrao Vikhe Patil had launched efforts under the guidance of the late Dr D. R. Gadgil, to set up the first co-operative sugar factory which came into being as the Pravara Co-operative Sugar Factory in Ahmednagar district in 1950. In India, 319 sugar factories were producing sugar last season. Of this, 157 were in the co-operative sector. Maharashtra's share in the co-operative sector was 68 factories producing 40 per cent of the total sugar production in the country.

The increasing tempo in sugar production in the State has helped to a great extent the grower members of these factories. There are four lakh members of co-operative sugar factories. This means this sector alone extends economic benefits to over 20 lakh rural population.

Average area under cotton in Maharashtra is 22.47 lakh hectares and the normal production is 9.5 lakh bales of lint. The State's cotton monopoly procurement scheme, the objective of which is to give guaranteed and remunerative prices to cotton growers by eliminating middlemen has also helped producers to improve their economic conditions.

By the end of January 1981, the total procurement of cotton under the scheme stood at 51.96 lakh quintals of *kapas* valued at Rs 245.47 crores. The average price worked out at Rs 472 per quintal. The procured *kapas* was equivalent to 10.10 lakh bales and 34.81 lakh quintals of cotton seeds.

Maharashtra has launched a unique scheme called the employment guarantee scheme (EGS) for the benefit of the weaker sections in rural areas. Though the scheme was introduced in May 1972, 1974-75 was the first normal year in which efforts for organisation of rural works programmme under the EGS were made. The mandays for which works under the scheme was provided—increased from 4.81 crores in 1974-75 and 10.95 crores in 1975-76, to 20.54 mandays in 1979-80. In 1980-81, the State Government spent Rs 105 crores on the works under the scheme. The average attendance on these works during the year was 5.66 lakhs. By March 1981, 10.874 works under the scheme were in progress involving nearly nine lakh workers.

To help the weaker sections particularly those living below the poverty line, the Chief Minister, Mr A. R. Antulay, has announced a number of schemes. The most radical of these schemes is the horticulture development programme. Under the programme, a horticultural development corporation would be set up to create horticultural estates on the lines of those established by the Maharashtra Industrial Development Corporation.

The radical part of the scheme is that it provides social justice to the weaker sections. Fortynine per cent of the participation in this corporation would be by agricultural landless labour and 51 per cent by the government.

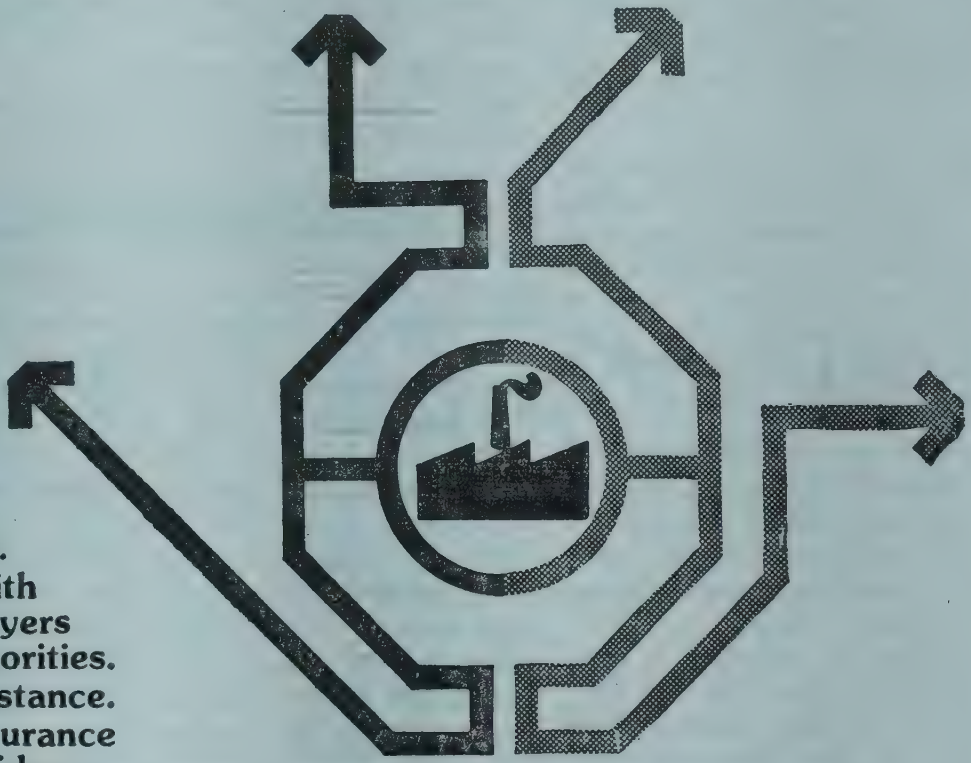
EEPC

assists exporters of engineering goods and services in many ways



- Assistance to small scale units.
- Establishing contacts with overseas buyers and project authorities.
- Export assistance.
- Finance, banking, insurance guidance.
- Liaison with servicing organisations in India and abroad.
- Liaison with the Government of India and governmental authorities on matters connected with engineering exports.
- Participation in exhibitions and fairs abroad.
- Publicity back-up.
- Raw materials assistance.
- Shipping and transport facilities.
- Trade delegations and study teams to target areas.
- Thrust on project exports.

Established in 1955 by the Government of India, Engineering Export Promotion Council (EEPC) was set up to promote the export of Indian engineering goods and services to earn much needed foreign exchange for the country. Today EEPC is amongst the premier export promotion organisations in the country, enjoying an international reputation.

Other activities

- To disseminate information overseas about the growing export potential of Indian enginering goods and services, the Council publishes a quarterly overseas journal, the Indian Engineering Exporter.
- To develop export awareness and analyse problems thereof, EEPC conducts seminars, workshops and meetings both at Regional and all-India levels.
- To disseminate information to member-firms and the industry through its regular periodicals: weekly bulletin Enginering Export News and fortnightly bulletin Project Export News.

With 10 Foreign Offices, 4 Regional Offices at Bombay, Calcutta, Madras and New Delhi and Territorial Divisions, EEPC assists exporters at home and overseas buyers in establishing contacts with appropriate sources of supply in India.

Imphal

DESPITE the government claims to direct the planning efforts at stabilisation of the economy, by and large, the conditions of the general public have not shown much improvement over the years. True there are the nouveaux rich among politicians, contractors, businessmen and bureaucrats due to flow of money, but there is a wide-spread complaint that the plan money is not properly utilised for which it is given. After thirty years of independence the people even in the Imphal city where the population has reached the figure of one lakh in course of years, does not get regular supply of drinking water though it is directly under the Government. A massive public health engineering department has also come up but water is the only thing which does not flow. When water is not available in the state capital, it is better not to think of the rural or interior hill areas. Nagas play a prominent role in the politics of the State but their district headquarters has no water supply system, though both of them now occupy high position and one is the Chief Minister. The Central Government continues to allot big amounts for the development of the State and the people would be happy if it scrutinises how the funds are spent.

Agriculture is the only sector which has made some worthwhile progress in the midst of gloom. The production in agricultural sector is quite good. Double and multi-cropping have been introduced. But again *jhuming* still continues to be the bane of hill economy. Recent survey revealed that in the name of control of *jhuming* huge amount running into several crores was spent. But there was only marginal benefit. Where the money had gone is the question.

The animal husbandry and the veterinary department of the state government is another department which failed to make any significant contribution towards the rural economy. Its 10,000-litre capacity chilling plant practically remains unused. Hardly 200 litres of milk are supplied from the government dairy and most of the time the milk is not treated. Similarly there is nothing to report on other activities of the department.

The acute shortage of power connues to be the major stumbling block for development. No industry can be set up without power. But even domestic consumption of Imphal could not be met. It seems there is no end to the tunnel of the Loktak hydro-electric project and one is not sure when the journey through the tunnel will end to see the light. It started with Rs 11 crores ten years ago; it already reached Rs 80 crores after ten years. Manipur now hardly produces 15 mw of power at the end of thirty years of independence. Progress is slower than that of the snail.

The state industry department provides loan and subsidies for setting up small scale industries. But it is not bothered how the money is being utilised. The result is that money has not been properly utilised and development of small scale industries is not encouraging. In private sector one watch manufacturing unit has come up. But the industries department is not extending any help to it. While the Central Government and the State Bank of India are helping it, the State Government even does not exempt the sales tax for its products. This concern can now produce one hundred watches per month.

The handloom industry of the State is famous. But the State Government is not in a hurry to revitalise it. There is no dyeing house even now. The Handloom and Handicrafts Development Corporation and the Small-scale Industries Corporation have yet to show why they are necessary. In the course of a decade, the industry department could not make the venture of making fibre out of pineapple leaves a commercially successful proposition though the textiles made out of this fibre have wide market. No one in the administration loses his sleep for the sorry state of affairs in the vital department for improving the economy and opening up new avenues of employment. The spinning mills, and khandsari sugar factory are two white elephants of the state government.

There is no progress in setting up forest-based industries to improve the economy of the hill people. Abundance of bamboos remains unexploited. On the contrary, in the hills, forest wealth is being indiscriminately wasted with abandon. Because of politics, the government machinery is helpless.

Pisciculture is an instrument to supprement, the income of the rural people in the fish-eating state of Manipur. The fisheries department has huge funds to distribute favours in the shape of loan and subsidy for fish production. It is quite generous in spending the money. Where the money goes is inexplicable. But the consumers know by sad and real experience that a kilogram of fish is not less than Rs 40 at times and even more. On the other hand, not for good reasons, the fisheries are being converted into paddy fields by the government. The meaning is too obvious to explain in the background of Manipur's environment. Interestingly, even money is doled out as loan or grants for pisciculture in the high hills. While Manipur needs 10,000 tonnes of fish per year, its production is only a little more than 2,000 tonnes.

The public works department has created a rich class of people but it has not shown its anxiety to improve and maintain a state communication system. One comes across reports that in these years money was shown as spent in many cases even without works being done particularly in the hills. In Manipur there is a phrase called "Akas bill" meaning while the things are in the sky, the payment is made *i.e.* payment is made before the supplies are made or **works done.**

As India entered the third decade of independence a section of educated youths in the central valley of Manipur turned insurgents taking arms into their hands to change the existing order and end what they call "exploitation". "The People's Liberation Army" (PLA) formed by a group of Ihasa trained youths under the leadership of N. Bisheswar Singh with Maoist ideology came into being. Bisheswar was captured on July 6 and seven top leaders of his organisation were killed. All of them, it is stated, experienced naked reality of poverty and injustic in the society. As the country's another year of independence begins its march, the Central Government must have a fresh look at the spectre of discountent in this easternmost part of the country, which created an explosive situation. Unemployment is growing by leaps and bounds and infrastructure for economic development is not yet in sight.

SHILLONG

FROM the tremendous increase in the number of automobiles, buildings, brisk trade and commerce in the urban areas of the State, it is possible to get an impression that the State of Meghalaya, which was formed only as late as January 1972, is abounding in affluence. But this would be far from a correct conclusion to draw, though urban areas have been the main beneficiaries of the manifold developmental activities and setting up of various institutions in the State. Meghalaya lives not in urban towns (the urban population was only 2,40,000 out of 13,28,000 or a little more than 18 per cent) and in the rural areas, where 81 per cent of the State population lives, nearly 65 per cent had a per capita expenditure of Rs 55 or less per month in 1973-74. The tribal population alone in Meghalaya constitutes 81 per cent of the total. Even for the urban areas 55 per cent of the population had a consumer expenditure of Rs 75 or less per month and these levels are considered as poverty lines in the State which was somewhat higher than national poverty line because of much higher price levels in the State. In 1978 the number of persons in the State below the poverty line worked out to a figure of 6.66 lakhs in the rural areas and 0.96 lakh in the urban areas. The standard of consumption in the State is poor. In the rural areas the expenditure on food items accounted for as much as 81 per cent of the household expenditure. According to the data thrown up by National Sample Survey (1973-74) non-food items like education, medicines and conveyance accounted for less than five per cent of the expenditure indicating that these are still a luxury in the rural areas.

Later statistics are not available and the estimates of State's income and per capita income of Meghalaya, according to official sources, are yet to be finalised. According to estimates prepared by the State Directorate of Economies and Statistics, which are yet to be vetted by the CSO the value of net domestic product for 1973-74 at current prices was Rs 65.41 crores and the per capita income was Rs 597.20 as against the all-India average of Rs 874.

Meghalaya is a hill state, less than a decade old, having first come in-

15th August—Our Pledge

The 15th of August India's Day of Independence. Haloed with the glory of two hundred years' unceasing struggle of the common people ..... shining with the blood and sacrifice of the countless martyrs.

15th of August is committed to that struggle and sacrifice ..... to establish people's right to shape their own destiny, ... to make possible a social system, free of exploitation, established on the solid foundation of equal rights for all nationalities, tribes, races, communities and classes.

India is a free country now. But that commitment still remains unfulfilled. Millions of toiling people are determined to fulfil their cherished objective—to defeat the conspiracy of the vested interests trying to subvert that sacred commitment to the people. They do not care for the democratic rights of the masses. They want to trample the people's indomitable desire to shape their destiny under the steam-roller of secessionism. They want to shatter the dream of an exploitation-free social system by perpetuating a reign of authoritarianism.

The unrepayable debt of blood and tears to those immortal martyrs and fighters for freedom has never been disowned by the people of the State. They are determined to redeem the pledge of 15th August through glorious and long-lasting struggle against oppression and tyranny on all fronts.

The Left-Front Government is a partner in the people's glorious struggle. It is determined to stand by the commitment of 15th August. Over the last four years this determination is writ large on the expansive grain-fields, is echoed by the resounding roar of the wheels of the industry, and is heard loud and clear in the voices of millions of people.

Today, when the dark conspiracies heighten, when authoritarian and separatist forces are overbusy in subversive activities, let the unity of the indomitable people be unbreakable; let the fond dreams of the freedom-fighters and the immortal martyrs come true-soon.

That's the pledge of 15th August. And may this pledge be proclaimed by the flutter of the Flag of the Independence Day.

Government of West Bengal

to existence as an autonomous state within Assam on April 2, 1970 and then as a full-fledged state on January 21, 1972. It was formed with two hill districts of United Khasi-Jaintia Hills and Garo Hills, carved out of the State of Assam, now converted into five administrative districts—a factor which by itself is a measure of progress made by the tiny, young State. The State covers a land surface of 22,500 square kilometres approximately which is 0.70 per cent of the total area of India. Only four other states of India, namely Sikkim, Tripura, Nagaland and Manipur are smaller than Meghalaya in area. Its population in 1971 was 10,11,699, or 0.18 per cent of India's total of 548 million. Its present population (1981 Census) is 13,27,874 out of which 6,78,883 are males and 6,48,991 are females. Meghalaya thus constitutes 0.19 per cent of the total population of India and ranks 21st in the country.

The decadal rate of growth is 31.25 which is slightly less than the decadal growth rate of 1961-71 which was 31.50. Here it is worth mentioning that after the 1971 Census the capitals of Assam and Arunachal Pradesh were shifted from Shillong, the capital of Meghalaya, and as a result a sizable number of population migrated from Shillong. But for this event, the decadal rate of growth in Meghalaya would have shown an appreciable increase in 1981. Compared to Meghalaya, the all-Inlia decennial growth rate for the decade 1971-81 is 24.79 per cent and thus Meghalaya has a higher percentage of decennial growth rate than the all-India figure. The density of population in Meghalaya per sq km in 1981 is 59 persons while in 1971 it had 45 persons. The East Khasi Hills district which has Shillong as its headquarters has the highest density of population with 98 persons in 1981 and 73 persons in 1971.

The literacy rate in the State is 33.22 per cent—males 37.13 per cent and females 29.28 per cent of the total population which includes even persons falling in the age-group of 0-4. Compared to 1961-71 the decadal increase of literate persons during the decade 1971-81 has been quite appreciable. Out of the total population of 13,27,874 the total literates in 1981 stood at 4,41,077—the decadal increase in absolute terms being 1,42,765 persons. In terms of decadal growth rate it works out to 48 persons. Out of 4,41,007 literates, 2,51,855 are males and 1,90,221 are females. While the total increase from 1961-71 of literates was only 53,234 it has shot up to 1,42,765 during 1971 81. During 1961-71 the male literates increased by 73,284. The corresponding increase for females literates was 26,637 in 1961-71 and 69,481 in 1971-81. Compared to 28.43 per cent of literates in 1971 the literate percentage in 1981 rose to 33 per cent. The male percentage rose from 33 per cent in 1971 to 37 per cent in 1981 and female percentage rose from 24 per cent in 1971 to 29 per cent in 1981. Of the five districts the East Khasi Hills district has the highest percentage with 42.69 per cent. Compared to Meghalaya the literacy percentage of India in 1981 is 34.80 per cent. Compared to the all-India figure (total 34.80 per cent—male 44.95 per cent, female 23.95 per cent), the Meghalaya rate of literacy is less than that of the all-India rate both for total and male persons whereas the female literacy rate of Meghalaya is higher than that of the all-India figure. And Meghalaya is a matriarchal State.

The percentage of literacy for the State was 26.91 in 1961. In 1971 also, Meghalaya's literacy rate was higher than the all-India average of 29.46 per cent. The percentage of literacy is higher in the urban areas than in the rural areas of the State, being 65.22 per cent in urban and 23.40 per cent in rural. The availability of better facilities for education and better facilities for employment in the urban areas account for this high percentage of literacy. The number of literates in Shillong city is at present 1,08,965 out of which 61,872 are males and 47,093 are females. The percentage of literacy is 62 per cent in general and 67 per cent for males and 57 per cent for females.

In 1971 Meghalaya ranked eleventh in the order of literacy among the states of India. Kerala ranked first with 60.42 per cent of literates while Jammu & Kashmir occupied the last place.

Out of the total population of the State, over 45 per cent of the population is found to be economically active. Fiftyfour per cent of the total male population and 34.5 per cent of the total female population are working. If 1,000 persons (1971) of each sex are taken their proportionate distribution amongst different categories is as follows: Cultivators—males 338, females 271; agricultural labourers—males 50, females 37; livestock, forestry, fishing, plantations, etc—males 16, females 7; manufacturing, processing, servicing and repairs-household industry—males 6, females 4; in manufacturing, etc (other than household industry)—males 10, females 1; construction—males 7, females 1; trade and commerce—males 19, females 7; transport, communication, etc—males 10, females 1; other services—males 75, females 17; total workers—males 532, females 346. It will be seen from the above that 338 males and 271 females per thousand population of each sex are cultivators which constitute the largest proportion of workers. Next comes those in other services accounting for 75 males and 17 females per thousand population. The majority of workers in this category are found in the urban areas of the State accounting for 251 males and 76 females per thousand population.

Among the total working population of the State, the female workers account for 612 per 1,000 male workers; the proportion is higher in rural areas being 673 and is lower in urban with 235. The largest proportion of female workers is found among cultivators, accounting for 754 per 1,000 males. The larger proportion is among agricultural labourers, contributing 704 females per 1,000 males. The next group is in the category of trade and commerce, contributing 373 females per 1,000 males. In recent years, however, the females are taking more and more to various categories of jobs in government offices as a result of increasing trend among them for receiving education and acquiring other skills.

Meghalaya's position in respect of per capita gross industrial output in 1978-79 was one-ninth of the all-India average; in per capita value added, it was one-third; in per capita industrial consumption of electricity it was one-fourth; and in per capita bank credit it was one-sixth of the all-India average. Also in relation to all-India average, Meghalaya's net area sown for cultivation as a proportion of total area was one-third; in value of forest produce per hectare, it was one-eighteenth and in fertiliser per hectare of cropped area it was one-half.

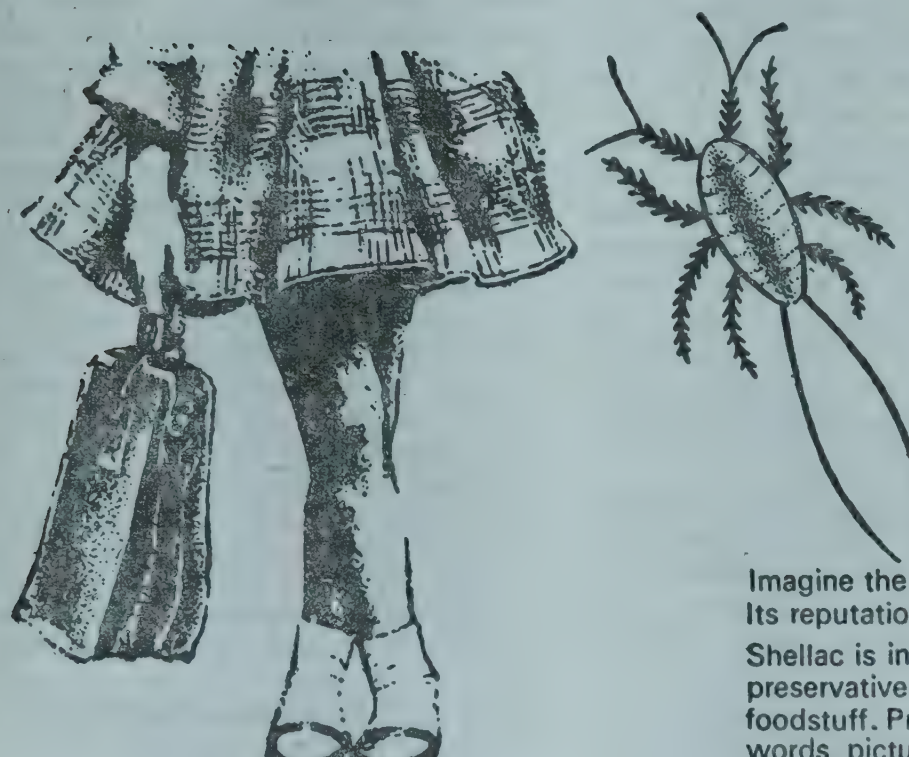
Meghalaya is predominantly rural, more than 81 per cent of the State population living in the rural areas. The tribal population constitutes about 81 per cent of the total.

Meghalaya is fortunate in not having the unemployment problem as acutely felt as elsewhere in the country. No firm estimate has so far been made of the magnitude of unemployment in the State. The results of the state sample of NSS 27th Round show that the person-days of the "wholly unemployed" in the rural area accounted for only 6.62 per cent of the total labour time disposition of the rural labour force. On this basis the number of wholly unemployed in the rural area of the State at the end of 1977-78 is placed roughly at 3,000. According to NSS, the level of unemployment in the urban area can be placed at 5.52 per cent of the urban labour force or roughly 3,200 in terms of wholly unemployed in 1977-78.

Despite various constraints Meghalaya has made tremendous progress in various spheres during less than a decade of its full statehood. The production of foodgrains increased from one lakh tonnes in 1969-70 to 150.18 thousand tonnes at the end of 1978-79. During the same period production of potato and cotton also increased significantly. Consumption of fertilisers also increased fourfold from the level of 1970-71. Under horticultural programmes, new progeny orchards have been established at several centres.

The area under minor irrigation has increased by about 3000 hectares. Production of milk in the State has registered nearly 100 per cent increase from the level of 1968-69. The production of eggs and meat also increased from 17 million and 15,600 tonnes respectively in 1972-73 to 21 million and 18,000 tonnes at present. The number of villages electrified has gone up to 212 in 1978-79 from only 52 in 1968-69.

A major index of economic development is the state of transport and communication facilities. Meghalaya has a hilly terrain and depends solely on road transport. There were only 13 km of road per 100 sq km in 1970. The State has now about 5,000 km of motorable roads and during the current year another 1,000 km are expected to be added. The number of educational institutions in the State increased from 1,914 in 1971 to more than 3,000 in 1979. The enrolment in schools has increased to 2,30,000 in 1979 from 1,68,000 in 1969. The existing number of primary health centres in the State is 23 as against 8 in 1969. The number of beds in government hospitals has increased from 175 in 1969 to 510 in 1979. The number of villages covered under the rural water supply scheme has increased to 243 from 84 in 1969. The Greater Shillong water supply scheme has been taken in hand while the Tura water supply scheme (Phase I), the Umkhen water supply scheme (Phase I) and Crinoline water supply scheme were completed during the Fourth Plan period.



SHELLAC
FOR ANYONE,
ANYTHING
ANYWHERE

The world of Shellac lies before the twinkling feet of the little girl. The secretions of the microscopic Laccifer Lacca insect is an indispensable part of her everyday life, as it is for almost anyone, anything, anywhere.

Imagine the delight of the little girl as she discovers Shellac. Its reputation as a big, very big foreign exchange earner.

Shellac is in the sole of her shoe as a stiffener for rubber. Shellac as a preservative—in tablets & capsules, in confectionary, in all kinds of foodstuff. Printing ink, so vital for her ever growing world of books, words, pictures, uses Shellac ever-increasingly to enhance colour-intensity and strength of print. Shellac in the flexographic ink used for printing her name across her satchel.

Shellac, impossible to replace in the paint and varnish of beautiful furniture, absolutely essential in the electrical industry, in photography, in cosmetics—in a million other things.

A must for human beings too, anywhere.

SHELLAC EXPORT PROMOTION COUNCIL

ORISSA

88 per cent below poverty line

By A SPECIAL CORRESPONDENT

BHUBANESWAR

ORISSA is among the poorest of the states and its per capita income has been the lowest with the exception of Bihar only. However, compared with the national average, the gap has persistently widened. From a difference of only Rs 89.1 in 1961 the gap grew to Rs 145.9 in 1976-77. Over this period Orissa's per capita income increased from Rs 216.5 to Rs 226 at 1970-71 prices, a very poor rate of increase indeed. The national figure had risen from Rs 305.6 to Rs 371 over the decade. Against such a background of low income growth, Orissa has the maximum percentage of population below the poverty line, some 88 per cent according the Sixth Plan document of the State prepared during the Janata regime.

Apparently there was an appreciable increase in the monthly per capita expenditure from Rs 18.76 in 1960-61 to Rs 39.18 in 1973-74 in the rural areas. But adjusted against the increases in the consumer price index there was a decline in rural terms.

There has been a fall in the quantity of consumption, by about 8.2 per cent in rural areas and 17.6 per cent in the urban areas during 1966-74, with 1960-61 as the base.

In urban areas, the monthly per capita expenditure rose from Rs 31.95 in 1960-61 to Rs 59.94 in 1973-74 at current prices. In terms of 1960 61 prices, there was actually a decrease from Rs 31.95 to Rs 26.34. So both in the urban and rural areas, there has actually been a fall in the living standards over the years referred to. The situation is probably worse today, considering the rapid erosion in the value of money and the State's extremely low rate of overall economic growth.

The expenditure on food items as a proportion of the total consumption is among the highest in the country, though not the absolute highest. According to the latest National Sample Survey report on consumer expenditure, Orissa's expenditure on food items was 75.73 per cent in rural areas, and 67.57 per cent in urban areas. These compare with 80.14 per cent and 68.04 per cent in West Bengal, 80.14 per cent and 73.95 per cent in Gujarat, 75.93 per cent and 68.98 per cent in Uttar Pradesh, and the all India average of 74.89 per cent and 67.72 per cent. The reference year is 1973-74, but the pattern is unlikely to have changed much since then.

With the proportion of expenditure on food items mainly cereals, steadily

Commerce Research Bureau

rising the average rural or urban consumer has much less to afford on luxuries or even necessities like milk, ghee, egg, fish or meat etc. No per capita consumption figures of these items are available for the simple reason that in a State like Orissa where almost 90 per cent of the people live below the poverty line, such surveys would be hardly worth anybody's trouble. In such a poor society, facilities for health or medical treatment are extremely inadequate. It has a total of 7,127 beds in all the hospitals, public or private, which means roughly one bed for every 4,000 of the population.

Agriculture provides employment to 79 per cent of the working population and accounts for 69 per cent of the State's income. Recurring droughts and irregular monsoon very often affect agriculture in the State. Even so, a growth rate of 4 per cent in agriculture has been recorded over the past 15 years. Industry's contribution in comparison is poor. It is roughly 14 per cent of the total gross product.

The population of Orissa was 21.945 million in 1971, as against an all India total of 547.95 million. Ten years later, the State's population grew to 27 million, while the national figure rose to 684 million (1981 Census), more or keeping pace with the national average growth rate in population.

Orissa is not among the states where literacy rates among males as well as females are high. It is 38.3 per cent among males, and 13.9 per cent among the females, and together, they average 26.2 per cent.

The occupational classification in Orissa is much on the expected lines. Since 91.6 per cent of a population of 27 million live in rural areas, agriculture and allied occupations provides employment to most able-bodied people. Underemployment is considerable, since there is so far no significant outlet in industry to take the population pressure off the land

On a rough estimate, the percentage of working force to total population would be about 25 per cent in the rural areas, and their dependents would constitute the remaining 75 per cent. In urban areas, the proportion of the workforce to the total population is more or less the same.

The State income at current prices worked out to Rs 1,613.36 crores in 1976-77, and the per capita income to Rs 662. At 1961-66 prices, these worked out to Rs 450 crores and Rs 226, respectively. Over a period of 15 years, the State income increased at an annual rate of 3.8 per cent (compound), and the per capita income at only 1.5 per cent (compound) per year.

PUNJAB

Prosperous rural community

From PRAKASH ANAND

CHANDIGARH

PUNJAB is admittedly the country's most prosperous State with the highest per capita income — Rs 2,101 (at current prices), about 60 per cent higher than the all-India figure, Rs 1.249, for the same year (1978-79). In fact, prosperity is writ large over the entire countryside where the vast majority of its people (72.28 per cent) live. Wherever one goes, one finds healthy, robust, well fed and well-dressed people, the exceptions forming a small minority. Perhaps nowhere else in the country does one find such vigorous, hard-working, enterprising and self-reliant people as in Punjab. Had it not been for these distinctive, traits most of them would have been living today as lower middle class people, or even worse. One has only to compare the standard of living of the millions of refugees who crossed the old Bengal border in 1947 with that of the countless people who crossed the old Punjab border when the country was partitioned in tattered clothes and in a pitiable condition. By dint of hard work and the spirit of initiative and enterprise they are now living in comfort after having transformed the land in bifurcated Punjab into a fertile tract.

The *green revolution* has indeed changed the picture radically; it has brought cheer as well as gold in the home of every farmer, changed his outlook on life, made him and members of his family aware of the importance of living well with all the luxuries and comforts he can afford. One sure index of the change that has come in the living style of the people of the State is the number of motor vehicles per lakh of the population. Punjab leads the country with the largest number of motor vehicles (1292) per lakh of the population, the second place being taken by Maharashtra (920 vehicles per lakh of the population). The all-India average is 486. Most of these vehicles are owned by well-to-do farmers and their families. The country side is dotted with good, neatly built, pucca houses in the midst of lush green fields. The number of motor vehicles owned by businessmen, Hindu or Sikh, is small.

Punjab tops in socio-economic growth. The State also leads in per capita food production, 767 kg; next comes Haryana with 562 kg. The consumption of fertiliser is the highest in Punjab (94.8 kg per hectare of cropped area).

The rapid progress made by Punjab during the last two decades in the econo-

The treasure in our seas

The Indian seas produce some of the finest seafoods in the world. Naturally, the world demand for our seafoods continues to grow with each day. In 1980-81, India earned foreign exchange worth Rs. 235 crores by exporting over 75,600 tonnes of seafoods.

So let us throw ourselves into the task. Let's strive to increase our exports. And spread prosperity for the nation.

THE MARINE PRODUCTS
EXPORT DEVELOPMENT AUTHORITY
COCHIN-682 016.

mic sphere is evident from the per capita income over the years : 1960-61, Rs 366 at current prices; 1965-66, Rs 562; 1970-71, Rs 1,030; 1975-76, Rs 1,597; 1976-77, Rs 1,812; 1977-78, Rs 1,962.

As a result of systematic and sustained efforts to bring about a "white revolution" in the State the per capita availability and consumption per day of milk has gone up to 518 gm which is the highest in the country, the all-India average being only 108 gm. Most families keep milch cattle.

Punjab also leads in the annual per capita consumption of electricity in India — another sign of progress, prosperity and good living. Punjab's figure (1978-79) stands at 25.97 kwh (domestic light and small power), the all-India average being only 11.81. The State's per capita consumption in industrial uses, including electric traction, water works and miscellaneous, is also the highest in the country (159 kwh), the second place being taken by Maharashtra (154.98) and the third by Gujarat (153). Chandigarh's figure is the highest (176.09), but that city is an exceptional case. The percentage of households in Punjab using electricity is 49.62, even though the State is predominantly rural.

The agriculture sector accounts for 52 per cent of the State's domestic product and 63 per cent of the working population registered a growth rate of 7.5 per cent in 1978-79. But there has been a decline since then.

Even the ordinary labourer in this State is much better off than his counterparts elsewhere. The rate of minimum wages, and also the maximum, brings out the difference in income and also in the level of living. For Punjab the minimum wages are Rs 207, the figures for Haryana being Rs 140, Himachal Pradesh 130, UP 110, Rajasthan 130, Delhi 169. The figure for Chandigarh is Rs 225, but this is an exception and does not provide any comparison.

Liquor consumption has already become a regular habit with the majority of Punjabi people, especially the Sikhs. In fact, a family whose adult members (and in numerous cases, even youngsters of school and college going age) do not drink is believed to have a low standard of living. The drink habit is spreading fast, partly because of the fruits of the *green revolution*. Good crops, remunerative prices and all-round success have led most people in the countryside, and also to a large extent in the towns, to drink, both as a relaxation and social prestige.

About 92,000 bottles of country liquor are consumed in the State daily, the estimate of the annual consumption of liquor being Rs 260 to Rs 275 crores. But not all those who drink habitually can afford the luxury; many petty farmers and artisans are in debt and yet they feel they must drink because it has become a part of their living style. The better off land-owners and the middle class people in towns drink whisky; in most social circles those who keep away from alcohol and those who preach prohibition are scoffed at.

Last winter the Punjab Government conducted a large-scale survey to identify the families living below the poverty line and hence unable to maintain even the minimum standard of living expected in Punjab. Thirty-eight per cent of the households in the rural areas and 10.8 per cent of those in urban areas were found to be in the lowest income group. On this basis it has been estimated that the incidence of poverty in the rural areas is three and a half times as much as in the urban areas. The standard of living of the people generally was found to be the highest in Ludhiana district (which is highly industrialised and where almost every member of the family earns by doing part-time jobs for mills and various other enterprises). The people in Gurdaspur district, where 43.8 per cent of the surveyed households have an annual income of up to Rs 3,600, have a subnormal standard of living. These two Punjab districts thus present a contrast in income and living styles. The indebtedness among the petty farmers is substantial, but the desire to live well predominates.

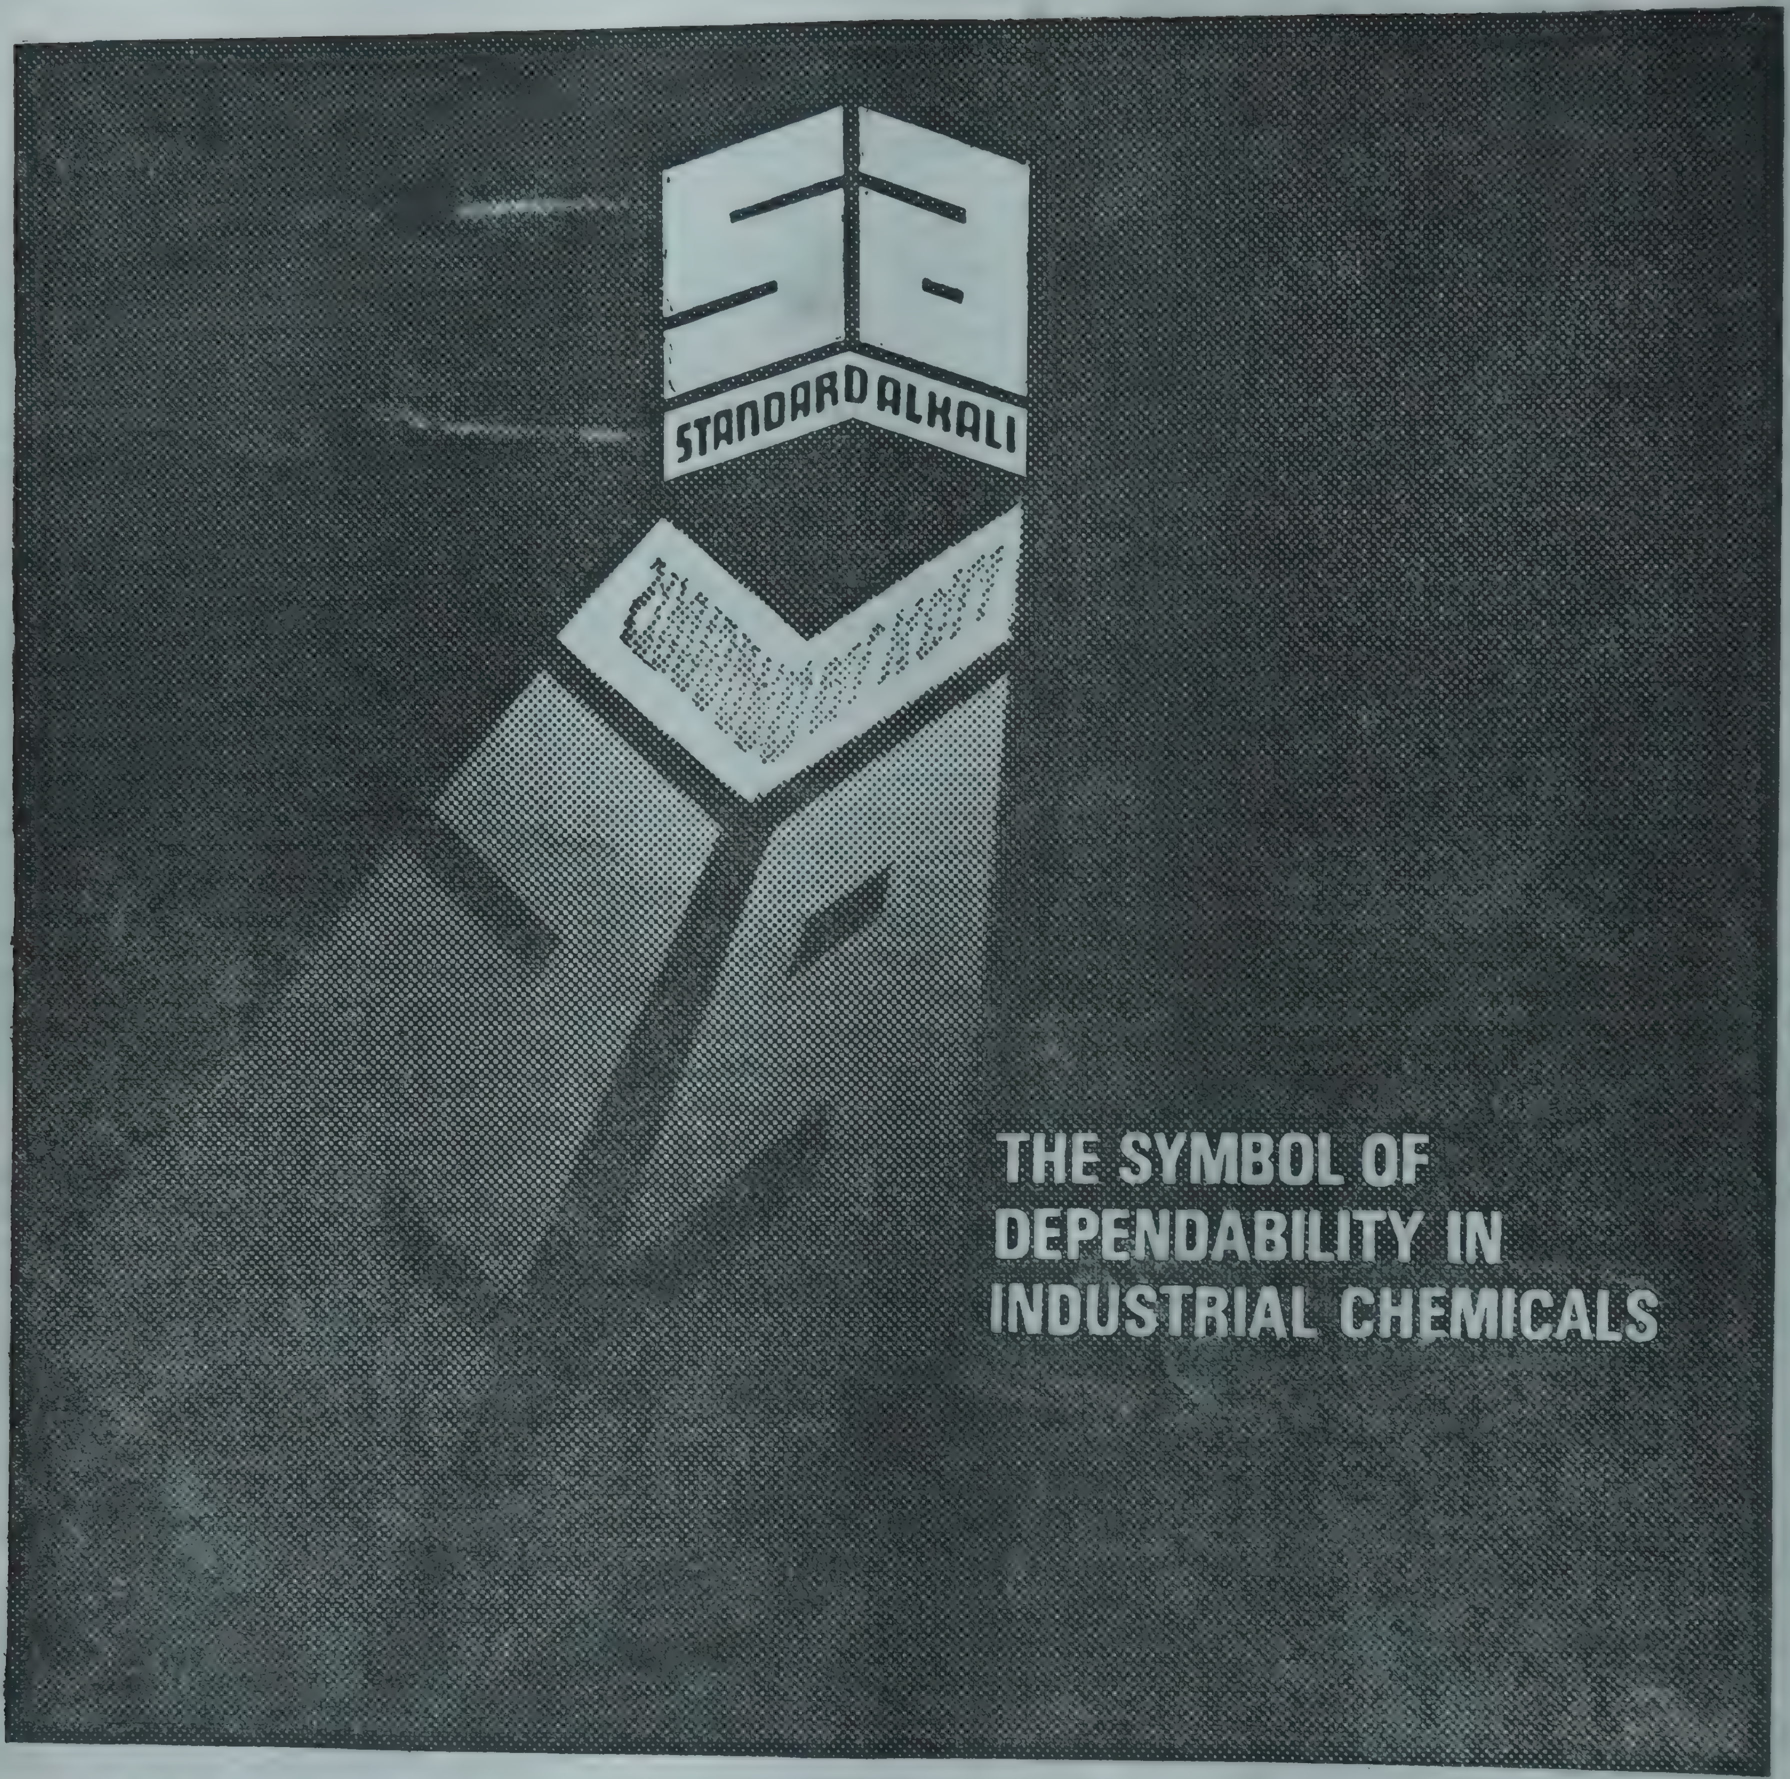
Even a casual visitor to the countryside in Punjab will notice the difference in the living standards now and those 25 years ago. There are radios, TV sets, bicycles, scooters, motor-cycles in most of the villages. The standard of dress is high; khaddar and coarse cloth is worn only by the poorest labourer; others wear terylene or terycot shirts and pants. The old style shoes (jutis) have gone for good and modern shoes are popular despite their high costs. There is crockery and furniture in most farmers' homes. Among the non-Sikhs the traditional "hookah" is out of fashion; the smokers patronise cigarettes.

Notable improvements in the style of living have also been brought about by Punjabis who have gone abroad and who send large sums of money to their families in the countryside. The generous remittances are used to buy land and houses and acquire several amenities. Every second family in central Punjab has a member in West Asia, Canada, the USA or Nigeria.

The fact that there is very little unemployment in Punjab's rural areas is another contributory factor to the relatively high standard of living. According to the State Sample Survey results (1977-78) — the 32nd round of National Sample Survey — the incidence of unemployment in the rural areas is only 2.10 per cent among males and 0.25 per cent among rural females in the 15-59 age group. The problem in the countryside is of underemployment rather than of unemployment, and even the incidence of underemployment is falling because the duration of the slack season in farming is getting shorter owing to intensive farming.

The growing demand for, and provision of, more educational facilities is another index of all-round progress and improvement in the standard of living. Punjab's literacy percentage is now 40.7 (1981 figure); the school facilities (percentage of age group) is 107 for classes I to V, against the all-India average of 80.9; for classes VI to VIII the percentage of age group is 50.9 against 37 (all-India), and for classes IX to XII it is 25.7, against 20.9 (all-India).

The attractions of urban life, with its countless facilities for entertainment and supplementing one's income, have affected Punjabis during the past two decades. This is clear from the shift of the population from villages to towns. According to the "Perspective Plan for Urban Development — 1981-82 to 2000-01", prepared by the National Council of Applied Economic Research, the rate of growth of the urban population in the State is likely to increase from 23.1 per cent in 1961 and 23.7 per cent in 1971 to about 30 per cent in 2001. The 1981 census showed that the urban population percentage was 27.72. It is estimated that unbanisation will increase to the record annual growth rate of 5.3 per cent — twice as fast as now in the next two decades.



STANDARD ALKALI
THE SYMBOL OF
DEPENDABILITY IN
INDUSTRIAL CHEMICALS

STANDARD ALKALI

For over a decade, Standard Alkali's products have been known for their superior quality and competitive prices.

Our customer list includes just about every important name in the industry today.

Coming to think of it, Standard Alkali has become synonymous with dependability.

Products on tap from Standard Alkali—Hydrochloric Acid, Caustic Soda, Caustic Potash, Potassium Carbonate, Chlorine, Carbon Tetrachloride and Chloroform.

RAJASTHAN

Decline in real per capita income

From M. P. JAIN

JAIPUR

EVEN after 30 years of Plan efforts, poverty continues to haunt Rajasthan and more so the rural masses in the State. The poor socio-economic infrastructural base, inadequate durable community assets, unemployment and underemployment are some of the inhibiting factors for the poverty and destitution.

The population of Rajasthan between 1951 and 1981 has more than doubled from 160 lakhs to 341 lakhs. The population growth rates of the State have been higher throughout this period than the growth rates for the country as a whole. Although there has been some improvement in urbanisation from 16.3 per cent in 1961 to 20.9 per cent in 1981, its rural population has gone up from 189 lakhs to 270 lakhs during the same period. Today, as much as 79.1 per cent of its people live in rural areas. According to the 1971 Census there were 80.49 workers which constituted 31.2 per cent of the State's total population. Of the total working force as much as 76.8 per cent were engaged in agriculture and allied occupations. Agricultural labourers accounted for 9.3 per cent of the total work force.

Similar is the case in regard to literacy. The literacy percentage in Rajasthan has improved from 19 in 1971 to 24 in 1981. Yet the number of illiterates has gone up from 209 lakhs to 259 lakhs during the same period.

The proportion of school going children in the 6-11 and 11-14 years age group in Rajasthan increased from 40.9 per cent and 14.4 per cent respectively in 1960-61 to 54.7 per cent and 26.3 per cent respectively in 1977-78. However, this is much below the national average of 82.8 per cent and 37.9 per cent for the above age group. Age-old traditions coupled with hardships suffered in the countryside by the rural families are mainly responsible for the low level of iteracy. There are families even now in the State having no literate person.

In 1977-78 about 105 lakhs people —86 lakhs in rural areas and 19 lakhs n urban areas — were found to be living below the poverty line which formed about 34 per cent of the State's total population. The corresponding percen-age for the country as a whole was 48 per cent. For measuring poverty among the people the Union Government has defined the poverty-line norm as that

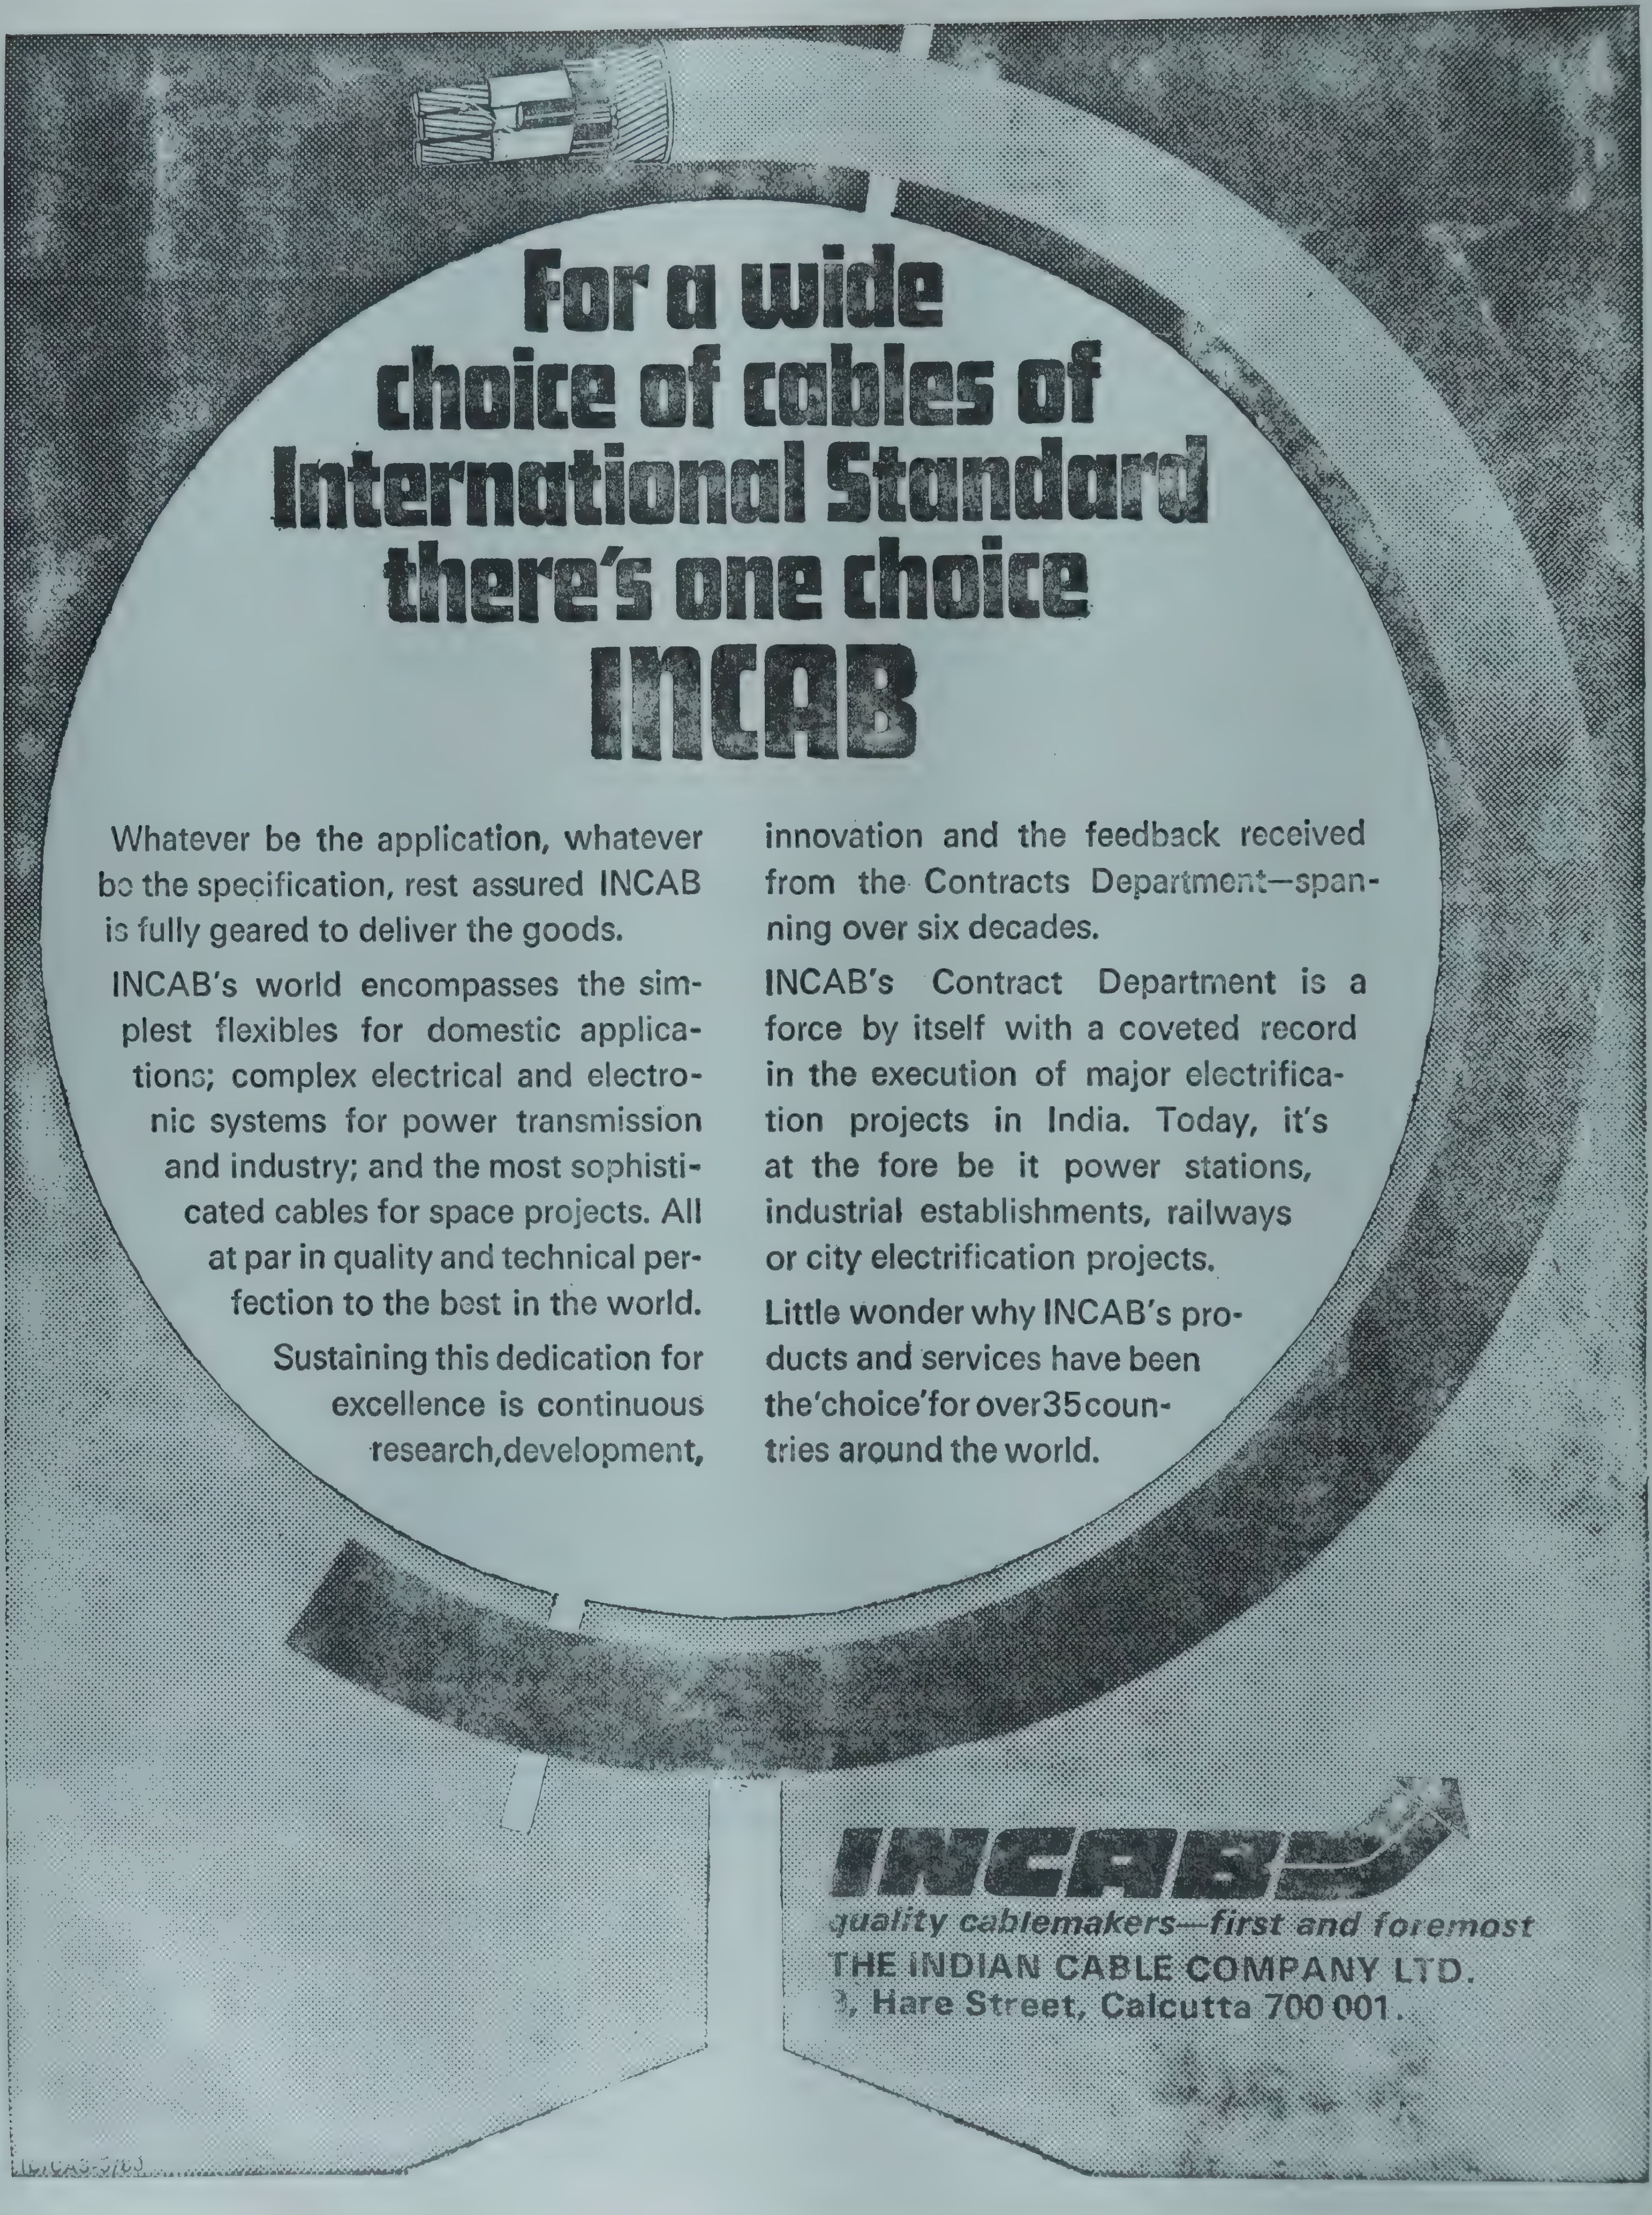
Commerce Research Bureau



For a wide choice of cables of International Standard there's one choice INCAB

Whatever be the application, whatever be the specification, rest assured INCAB is fully geared to deliver the goods.

INCAB's world encompasses the simplest flexibles for domestic applications; complex electrical and electronic systems for power transmission and industry; and the most sophisticated cables for space projects. All at par in quality and technical perfection to the best in the world.

Sustaining this dedication for excellence is continuous research, development, innovation and the feedback received from the Contracts Department—spanning over six decades.

INCAB's Contract Department is a force by itself with a coveted record in the execution of major electrification projects in India. Today, it's at the fore be it power stations, industrial establishments, railways or city electrification projects.

Little wonder why INCAB's products and services have been the 'choice' for over 35 countries around the world.

INCAB

quality cablemakers—first and foremost

with per capita monthly consumption expenditure of Rs 65 (at 1977-78 prices) corresponding to a minimum daily calorie requirement of 2,400 per person in rural areas and the per capita per month consumption expenditure of Rs 75 (calorie requirement of 2,100 per day per person) in urban areas.

According to the Agricultural Census, there were 37.27 lakh operational holdings with a total area of 20.34 lakh hectares in Rajasthan in 1970-71. The number of holdings have since gone up to 43.65 lakhs while the operated area declined to 20.30 lakh hectares in 1976-77. Over the years, because of the increase in the number of people depending on land as also the fragmentation of land holdings, the size of land holdings has gone down.

The average size of a landholding declined from 5.46 hectares in 1970-71 to 4.65 hectares in 1976-77. In 1970-71 the marginal and small farmers (*i.e.* having land up to two hectares) constituted as much as 44 per cent of the total number of landholders in Rajasthan while the area operated by them was only seven per cent. In contrast, large farmers (*i.e.* having land above ten hectares) accounted for only 14 per cent of the holdings but 57 per cent of the operated area. Although the shares of these respective categories have undergone some change for the better in 1976-77, the fact remains that a few large farmers continued to corner a large chunk of the area under operation. In 1976-77, the share of small and marginal farmers in the number went up to 49 per cent and in area to 9 per cent. On the other hand, the share of large farmers in holdings as also in area declined to 12 per cent and 52 per cent respectively. This could partly be attributed to the distribution of some surplus land to landless agricultural labourers which became available because of land ceiling laws. However, the progress on this front is rather dismal. In Rajasthan a total of about one lakh hectares of land was declared surplus of which about 89,000 hectares of land had been taken possession so far: Out of the land in possession, about 49,000 hectares or 55 per cent was distributed among 26,000 beneficiaries.

In Rajasthan the level of assets is low and at the same time there is a high degree of indebtedness among the rural households. The percentage of all rural households in the State having assets up to Rs 1,000 was 6.4 per cent while it was 47.2 per cent for agricultural labourers Reserve Bank of India, *All-India Debt and Investment Survey* : 1971-72). The corresponding figures for the country as a whole were 19.7 per cent and 69.1 per cent respectively. As regards indebtedness, the Fourth Rural Labour Enquiry (1974-75) revealed that the average amount of debt per indebted agricultural labour household went up from Rs 585 in 1964-65 to Rs 1,434 in 1974-75, when compared with the all-India figures of Rs 244 and Rs 584 respectively. The indebtedness in Rajasthan was the second highest in the country after Haryana (Rs 1,648).

Provision of safe drinking water is an acute problem. Nearly 72 per cent of the total inhabited villages in Rajasthan numbering 24,037 are categorised as problem villages in this regard. By the end of March 1978 it was possible to provide safe potable water to only 4,005 problem villages. The only consolatio is that all the towns in the State are covered by protected water supply schemes.

As regards medical facilities, there has been some improvement over the past two decades. The number of hospitals and dispensaries has gone up from 491 in 1961 to 3,959 in 1979. Similarly the number of beds in hospitals has increased from 9,459 to 16,979 during the same period. Although the doctor-population ratio has shown some improvement (one registered doctor for about 17,000 population in 1960-61) over the years, yet in 1977-78 it was far from satisfactory at one registered doctor for 10,000 population.

The net domestic product (at current prices) of Rajasthan has risen from Rs 1,593 crores in 1970-71 to Rs 3,199 crores in 1978-79 registering a compound annual rate of growth of 9.2 per cent while the per capita income (at current prices) during the same period has gone up from Rs 625 to Rs 1,025 — recording a lower annual growth rate of 6.4 per cent.

However, in order to assess whether the standard of living of the people in Rajasthan has shown improvement or whether it has deteriorated, it would be more appropriate to compare the State income and per capita income in real terms over a period of time. It would be seen that even in real terms, the net domestic product of Rajasthan (at 1960-61 prices) has shown a rise from Rs 908 crores in 1970-71 to Rs 1,004 crores in 1978-79, achieving a growth rate of only 1.3 per cent per annum. The comparison of per capita income at constant prices (*i.e.* at 1960-61 prices) during this period, on the other hand, bring out an interesting fact. The per capita real income declined from Rs 356 in 1970-71 to Rs 321 in 1978-79, thereby recording a negative growth of 1.3 per cent per annum. This could largely be attributed to the much higher growth rate of population of 2.8 per cent per annum (1971-81 decade) than that for the State income.

The State Government had introduced a number of schemes during the various Five Year Plans which were largely aimed at induction of investment in various sectors of the economy on the assumption that the direct and indirect benefits would ultimately trickle down to the poorest and would assist in raising the standard of living of the people by improving incomes. Although some programmes like SFDA and Special Animal Husbandry Schemes meant for a particular section of the rural poor did aim at the betterment of the individual, they were highly limited in their scope of coverage. Even within this category, the programmes benefited the comparatively better off small farmers than the more deprived lot namely the marginal farmers and the agricultural labourers.

The Rajasthan Government, therefore, launched on October 2, 1977 a new programme called *Antyodaya* meaning the upliftment of the last man. The programme was meant for the poorest amongst the poor in the rural community. The process of coverage of the programme from the poorest man upwards would continue till the man right on the poverty line was reached.

Under this programme it was decided to identify five poorest families from amongst those below the poverty line in each of the 33,000 villages in the State, thereby covering nearly 1.60 lakh identified families. These families would be provided with various economic benefits through self-employment, wage employment and old age pension. For identification of the families the following criteria were prescribed :

1. Families under severe destitution having no economic assets and no member in the age group of 15-59 years.
2. Families having no economic assets but having one or more persons capable of economic activity where annual family earnings did not exceeds Rs 1,200.
3. Families with some assets whose annual income was below Rs 1,800 per annum.
4. Remaining families having some land and assets but were below the poverty line.

The Programme Evaluation Organisation of the Planning Commission had undertaken an evaluation of the working of the *Antyodaya* Programme in 1978. The evaluation revealed that as on January 31, 1979, the target of identifying 1.60 lakh poorest families was achieved and a total of 1,39,815 families were benefited—23,949 families through old age pension, 42,666 families through land allotment, 5,926 families through

TAMIL NADU

Over 70 per cent below minimum standards

From OUR SPECIAL CORRESPONDENT

MADRAS

IN Tamil Nadu, thirty years of freedom have thrown up a paradox of the urban elite and middle class enjoying better standards of living while the rural masses continue to wallow in poverty, with no prospects of a better living in sight.

Of the State's population of 48 millions (according to the 1981 census), 34 millions live in rural areas. Fortysix per cent of the rural population and 37.30 per cent of urban population are estimated to live in the poverty sector and could ill-afford a nutritional diet. Taking into consideration other minimum needs such as housing and clothing it has been estimated that over 26 million rural people representing 73.80 per cent of the rural population and 12 million urban people, representing 72.9 per cent of the urban population are below the minimum standard of life. The various developmental schemes should be aimed at these 38 million people who are living below the minimum standard.

The self-sufficiency programme recently launched by the Tamil Nadu Government is a new chapter in rural development which attempts to bring about a fundamental change of approach to rural problems inasmuch as it aims to provide all the basic necessities of life for the rural people within a time frame.

The second notable feature of post-independence Tamil Nadu is that while the agricultural sector has made significant progress in productivity and has accelerated the economic progress of the State, the per capita income in this sector continues to be lower than that in the secondary and tertiary sectors.

It is paradoxical that while food production is increasing, the average intake of calories, protein and other nutrients by different segments of society shows wide disparities. The average calorie intake of children below three years falls short of the recommended level of 1,200 calories per head per day by 500 to 700 calories.

Similarly, the shortage in the case of pregnant and lactating mothers is nearly one-third of the recommended requirement which is 2,500 to 2,900 calories. The average consumption of the general adult population is of the order of 2,200 calories which is again 600 short of the recommendation. Protein consumption by the adult population amounts only to two-thirds of the mini-

Commerce Research Bureau

mum recommended. Judged by the National Sample Survey data for consumption expenditure in Tamil Nadu, nearly 55 per cent of households spend less than a rupee (according to current price level) per day per head on food which can barely provide a per capita 2,200 calories out of the cheapest available food. Morbidity statistics from a children's hospital showed that nearly 20 per cent of incidence of disease among pre-school children can be related to nutritional deficiency. A medical survey of 40,000 school children showed that 36 per cent of them suffer from malnutrition.

The position of medical care which, next to food, is important for healthy living is not quite satisfactory. The 379 primary health centres which serve rural areas afford only the most rudimentary health care. The taluk hospitals are restricted to curative work and the quality of their work suffers from inadequacy of staff and absence of specialities. The lack of adequate medical staff together with absence of transport facilities renders proper servicing of the primary health centres by the hospitals well-nigh impossible. It is needless to mention that the number of beds in hospitals is inadequate and the doctor—population ratio is high. There is also need to develop a coherent working relationship between indigenous and allopathic systems of medicine which today function in separate watertight compartments.

Disease control programmes have also serious constraints, physical and financial. Malaria, which was practically eradicated a decade ago, has staged a comeback with a vengeance, thanks to the growing insanitary conditions in different parts of the State and poor progress of underground drainage schemes. About 15 million people are exposed to the risk of philariasis in the State. As regards smallpox eradication scheme, the staff is found to be inadequate to achieve the targets and the progress in containing cholera is being handicapped by the delay in provision of safe drinking water to the population.

Protected, piped water supply, which is essential to control water-borne diseases, both epidemic and endemic, is available only to 60 per cent of the urban population and that too not adequately. The position is worse in rural areas where more than 130 million people live in scarcity areas. Out of 52,658 villages and hamlets 4,653 do not have any water source, while 3,683 do not have potable water and 14,486 have only inadequate water supply.

While water supply is unsatisfactory, drainage facilities are worse. Only 24 per cent of the urban population is served by underground drainage. The drainage system functions only in the two corporations (Madras and Madurai), five municipalities and four townships, covering in all only four million population. Even in these towns and cities, the system does not cover the entire corporate area.

Traffic and transportation pose a major problem to large agglomerations, especially Madras. The increasing number of motor vehicles coupled with the slow moving traffic and inadequate road width cause serious transportation problems. The majority of commuters depend on bus service in the absence of an integrated transportation system. The fleet strength and frequency of bus service are inadequate to meet public needs. The recent savage hike in bus fare has hit the urban public hard.

The housing situation in major urban centres is causing concern. Lack of adequate housing is the main cause of slums mushrooming near urban agglomerations. The backlog in housing is heavy and a massive effort is yet to be made to wipe out the shortage and the demand of the rapidly growing urban population. There are no detailed statistics available for a correct assessment of future needs. It is, however, estimated that the housing deficit is of the order of 510,000 dwelling units in class I towns and 440,000 in class II and III towns, bringing the total shortage to 950,000 units. The bulk of this shortage is in respect of the economically weaker and low income groups of the population.

The Tamil Nadu Housing Board and the Tamil Nadu Slum Clearance Board are constructing houses and flats for various categories of the population, both in urban and rural areas to the extent possible with available funds from HUDCO and other lending agencies. But the attempts of these bodies have just touched the fringe of the gigantic problem. The Housing Board has planned to step up its rural housing programme by constructing two lakh houses in the next five years. But such a massive plan is yet to be evolved for urban areas.

There has been a phenomenal growth in the number of schools and all villages with a population of 300 have an elementary school within a radius of one mile. There are 4.45 lakhs of boys and 2.28 lakhs of girls in schools. Investment on education is quite high and free education in schools has helped the children from weaker sections to acquire education. Though enrolment was high in elementary schools, the school system had paradoxically contributed to growing illiteracy on account of the heavy drop-out rate of 53 per cent in standards 1 to 4.

While the introduction of the plus two course with its stress on vocational education had improved the quality of school education and employability of the students, college education in the State continues to produce unemployable graduates as the syllabus continues to be outmoded. Restructuring of the syllabus to make it purposeful is the dire need of university education in the State. Exact figures of unemployment in the State are not available. It can however be estimated that 20 lakhs of persons are unemployed in the different sectors. The problem of educated unemployed is becoming more acute year after year.

Many steps have been taken to reduce inequalities between the various sections of society. While legislation was passed to fix a ceiling on land holdings and distribute the surplus lands taken over from big holders to the landless, no attempt to remove glaring inequalities among urban people has been attempted. The problems of poverty and unemployment continue to be grave even after many plans. If economic development should be meaningful, it is necessary to formulate and implement specific measures to relieve the distress of the low income groups and bring down levels of unemployment to tolerable limits.

Rajasthan: Decline in real per capita income

Concluded from page 63

employment, 60,012 families through credit facilities and 7,262 families through other schemes. Over 17 per cent of the benefited families were sanctioned old age pension. This was purely a welfare gesture and thus had little impact on increasing the earning power of the families concerned.

Although there were encouraging reports from some families that their employment and income had increased after they were brought within the *Antyodaya* Programme, there were also cases reporting the lacuna in that no special arrangements were made for providing technical know-how in management, production and marketing. Thus, the identified families who possibly had low motivation and low assets were left to struggle themselves after land/loan were disbursed. Therefore, the extension agencies as well as the technical personnel, particularly in the field of cottage industries, etc. should assist these families immediately to help achieve the desired objective of building assets and enable the poorest of the poor families to cross the poverty line.

UTTAR PRADESH

Wide disparity in urban & rural consumption

From K. L. MUKERJEE

LUCKNOW

GROWING poverty coupled with unemployment is the biggest drag on the economy of Uttar Pradesh, the most populous State in the country. The impact of relatively higher growth rates achieved during the 70s on reduction of poverty, unemployment and under-employment has not been very encouraging.

In fact, the spiralling prices and the fall in the State per capita income have considerably reduced the purchasing power and the living standards of the people except those of the well-to-do section and the 'neo-rich'. Many studies made in the past have revealed that the fruits of development have fallen rather disproportionately, mostly to the share of the well-to-do. The per capita monthly expenditure in urban areas is as much as 27 times in the rural areas. There is a visible disparity between the consumption of rural and urban areas.

The growth rate of per capita income in different plans ranged from 0.2 per cent to 1.2 per cent per annum. This state of affairs as also the perpetuating maldistribution of assets is responsible for keeping about 47.18 per cent of the population of the State below the poverty line

Poverty encompasses the totality of life and existence of the afflicted population. A committee was formed under the chairmanship of the late Mr Jaiprakash Narayan to suggest ways and means of eradicating poverty of the weaker sections of the population. This report was submitted in 1961. The study ground had classified the village community broadly into 10 different categories.

It has suggested that except the category of families who form the well-to-do sections of the village community and those who have "economic" land holdings, the other nine categories can be treated as weaker section and for the eradication of poverty of them an integrated development programme was needed. This, however, could not be done. Though the State Government took bold steps in introducing some programmes for *antyodaya*, these proved illusory to a great extent.

The SFDA (Small Famers Development Agency) experience has high-

Commerce Research Bureau

lighted several problems and issues. The major limitation has been the extension and coverage of the areas. There is need for extending the geographical and numerical base of the programme to effectively tackle the problems of poverty and unemployment.

Given the structural characteristics of the economy with agriculture and allied sectors contributing about 57.5 per cent of the state domestic product, quantification of unemployment and underemployment problem presents some serious conceptual and statistical problems.

While there has been a significant shift in the pattern of employment during the decade 1961-71 in the unorganised sector (the number of agricultural labourers increased by 67 per cent and the share of agricultural wokers in the total labour force from 11 per cent to 20 per cent), the overall growth rate of employment in different sectors during 1971-79 has been 2.2 per cent per annum. The private sector's contribution has been negligible. That of public and corporate sectors has been 2.3 per cent each.

An analysis of percentage contribution of income from different production sectors indicates that the contribution of primary sector to the total state income decreased from 60.2 per cent in 1971-72 to 51.7 per cent during 1978-79, whereas the corresponding percentage contribution of the secondary and tertiary sectors increased from 11.2 and 28.7 to 16.6 and 31.7 respectively.

The norm of poverty, as laid down in the Draft National Plan (1978-83) is based on minimum nutritional requirement of 2400 calories per day per person in rural areas and 2100 calories per day per person in urban areas. By application of this norm on consumer expenditure collected in the 32nd Round of NSS (1977-78), the cut-off points in respect of per capita monthly expenditure get determined at Rs 63.30 for rural area and Rs 74.76 for urban areas (at 1979-80 prices) in the base year 1979-80. In other words, all ouseholds with per capita monthly ex-enditure in 1979-80 below these limits onstituted the population below the overty line. The per capita monthly xpenditure in urban areas is 1:27 times ore than in the rural areas. There is isible disparity between the consump-ion levels of rural and urban areas.

If one calculated the income need-d to keep a person healthy according o nutrition based norms, it will be ound that the diet of a very large num-er of persons is below the standard. They have incomes that are hardly sufficient to buy nutritionally minimum diet.

Those below the subsistance level are compelled to take up any type of job even if it fetches a nominal return. This pinch has increased further as in UP the earning member has to support a larger family due to high dependency ratio, which works out to 2.23 as against the national average of 2.04.

Live Register figures show that the intensity of unemployment has increased in the 70s. A steady growth from 4.25 lakhs in 1971 to 14.36 lakhs in 1979 is a clear indication of the fact that in the current level of economic activity, demand for labour has fallen short of supply.

Unemployment continues to grow among the educated. During the period 1975-79, the number of persons registered has doubled in all categories of such persons with general education. On June 30, 1979 high school and intermediate pass students together accounted for 76.14 per cent of the total educated registrants, while the proportion of graduates and post-graduates was 20.47 per cent and 3.39 per cent, respectively. Among technical persons except for the category of postgraduates in agriculture and university teachers, all others showed an alarming increasing trend in unemployment.

The strategy designed in the past to restructure the State economy, it seems, has failed to strike the very roots, of institutions and socio-economic and administrative structure. Efforts made, if any, in the past proved ineffective to keep the per capita expenditure of those above poverty line at a resonably constant level. The present trend shows that the spending spree may increase sharply.

In view of the pressing limiting factors, the state planners have proposed to bring up the bottom 20 per cent of the population above the poverty line. Accordingly, the population below the poverty line may be reduced to about 27 per cent and, the disparity in consumption levels of rural and urban areas brought down from 1:27 in 1979-80 to 1:25 in 1984-85.

Unfortunately, in some way or other, various plans and measures till now implemented with a view to better the condition of the poor and the deserving have been constituted and also carried out mostly to benefit those who are economically well off. Our plans are drawn up and implemented by a class of people who hold the power and naturally they want to remain in power. Thus, perhaps, unconsciously, their plans, though aimed in the long run to benefit the common man, who has no say at all in their drawing or their implementation, except as a daily wage labourer, benefit themselves and their kind. And, *Garibi Hatao* remains a far cry.

Gujarat : Better living for more people

Concluded from page 25

spite of this progress in literacy, the number of illiterates went up from 171 lakhs in 1971 to 191 lakhs in 1981.

The number of educational institutions imparting primary education increased from 18,512 in 1960-61 to 24,000 during 1979-80. The number of pupils enrolled in these schools was around 48.8 lakhs in 1979-80 as against 22.5 lakhs in 1960-61. The number of schools imparting secondary education which was only 1,099 in 1960-61 rose to 3,116 in 1979-80. The percentage of enrolment in class I to V in the age group of 6 to 11 was 96.5 per cent of the total population in the age group in 1978-79 and 45.9 per cent in class VI to VIII in the age group of 11 to 14. There were 370 institutions in the State for higher education at the end of 1979-80 and the students enrolled numbered two lakhs.

The per capita expenditure on education in Gujarat increased from Rs 15 in 1970-71 to Rs 52 in 1980-81 which showed an increase of about 247 per cent.

The reasons why the people of the State are comparatively better off are varied and have a long history behind them. With a long coastline of over 1,000 miles, Gujarat had long maritime traditions. Thousands of Gujaratis sailed to various countries for trade and work in country crafts and brought back home goods and wealth. Even in recent decades, the mass exodus of illiterate and semi-literate rural youth to foreign countries has meant sizable inflow of cash resources, which are net additions to the State's income from production. The farmers in the State are diligent and intelligent. In terms of industrialisation too, Gujarat had a head-start long ago. The fact that Gujarat already ranks third in terms of industrialisation and has recorded substantial increase in production of cash crops, also explains the phenomenon of larger number of people sharing the growing size of the State's income.

WEST BENGAL

No money for milk or meat

From **P. C. MAHANTI**

Calcutta

THOUGH among the highly industrialised states, West Bengal's proportion of rural population to the total is still very high — some 75 per cent — and as many as 70 per cent of them still live below the poverty line. The situation is better in urban areas but these also close to 40 per cent live below the poverty line. In absolute terms, these work out to 26 million in the rural areas, 4.2 million in urban areas. Over the decade the proportion of rural population to the total has not materially changed.

Since 70 per cent of the rural people live below the poverty line and 80 per cent of their monthly expenditure goes towards food purchases, the levels of living must be such where eggs, meat, milk or man-made fibres become luxuries. A per capita consumption figure can still be worked out but no attempt has been made to do that. As for the urban sector there are two sections there too — the affluent section and the urban poor. The levels of living vary from one section to another, but as has already been pointed out even in industrialised West Bengal, the rural population devotes nearly 80 per cent of its income to food purchases, cereal purchases, that is.

In the urban sector where the prices of food and edible oils are rising fast, probably a very large chunk of the income goes towards the purchases of these daily necessities. The left-over for the majority may not be sufficient to purchase such items as ghee, milk or man-made fibres which may be the privilege of people only in high brackets of income. So here also the per capita consumption figure for the people as a whole would be misleading and certainly not meaningful.

In the absence of any survey of rural indebtedness for at least the past decade it is extremely difficult to work out per capita assets or liability figures

West Bengal as per the latest census (1981) has a population of 54.45 million, compared with 44.312 million a decade ago. It gives a growth rate of 2.1 per cent annually, not in the highest bracket among the states, but certainly a high rate considering the truncated State's partition hit land area.

The literacy rate by the national standards is high, some 50.5 per cent among the males and 30.3 per cent among the females. The average for both is 40.9 per cent. The national rate of literacy is

Commerce Research Bureau

36.2 per cent. In the 1971 census, West Bengal's literacy rate was 32.2 per cent for both females and males — as in the national sphere, it shows considerable progress.

The State's net domestic product totalled Rs 6,631.12 crores (1977-78) which comes to Rs 3,912.03 crores at 1970-71 prices. The net per capita income at current prices stood at Rs 1,302.8, while at 1970-71 prices, it came down to Rs 768. Agriculture, forestry and fishery together provided Rs 1,700 crores of a total income of Rs 4,539 crores in 1977-78, which was nearly 40 per cent of the total. Manufacturing, in the registered as well as the unregistered sector, provided over Rs 600 crores or about 16 per cent of the total income, while public administration and other services contributed mostly Rs 340 crores, or just about 6 per cent. The State's economy still depends a good deal on its agriculture for a very large part of its gross product. Consequently, it has around 43 million of the population living in rural areas and over 11 million in urban areas. The proportion of the urban population to the total is around 25, so the rural population is 75 per cent of the total.

West Bengal's working population as per the 1971 census is calculated at 12.37 million. The breakdown is given in the table below :

Distribution of workers by broad categories in West Bengal (1971 Census)]

Category of workers	No. in million	Percentage to total workforce
Cultivators	3.96	32
Agricultural labourers ..	3.27	26.4
Livestock forestry fishing etc. .	0.36	2.9
Total Agricultural and allied workers	7.59	61.3
Mining, quarrying	0.12	0.9
Manufacturing	1.74	14.1
Construction	0.12	1.0
Trade and Commerce ..	0.98	8.0
Transport storage and communication	0.52	4.2
Other services	1.30	10.5
Total nonagricultural workers	4.78	38.7
Grand Total	12.37	100.0

With the population in the 1971 census reckoned at 44.3 million, the proportion of the working force to the total works out roughly to 27 per cent. The pattern is likely to be the same in the 1981 census, although the details for the above calculation are not yet available.

To find out the correct levels of living in the State one has to tackle the urban and rural sector separately. It is the same about public health as well. West Bengal has a total 2,400 medical institutions including 342 hospitals, 625 clinics, 980 health centres and 405 dispensaries, and together they have 53,465 beds which gives a bed per every 500 of the population, but the average is misleading for a majority of these institutions happen to exist in urban centres.

The unemployment problem is serious in the State; that of educated unemployed particularly acute. A year ago, nearly one million educated were registered with employment exchanges as job seekers. The majority were men. Among them, some 3,000 were engineering graduates and some 150 were medical doctors. A total of 2.5 million are employed in the public and private sectors. Interestingly, the public sector is a greater source of employment in the State than the private sector, accounting for some 1.4 million out of a total of 2.5 million. Of rural unemployment, which is really underemployment no real estimate is available yet, but it is widely known that the problem of underemployment or disguised unemployment is quite serious in West Bengal.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE
FOR MONITORING CURRENT DEVELOPMENTS
IN THE INDIAN ECONOMY

*The research work of the Bureau is organised through these nine Divisions : (1) Agriculture, (2) Industry, (3) Corporate Sector, (4) Regional Economics, (5) Banking and Finance, (6) International Economics, (7) Unorganised Sector, (8) Science and Technology, and (9) Special Studies.

*Each Division is manned by experts who have specialised in their respective subjects.

*Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

*Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

*Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

DOCUMENT

Uncertain '80s for developing world

THE external pressures on developing countries have shown little sign of easing over the past 12 months. The combined current account deficit of the oil-importing countries rose from $ 26 billion in 1978 to $ 70 billion in 1980 and may rise even higher this year. Slow growth in the industrial countries is curbing demand for developing countries' exports while the price of petroleum (a product that now constitutes some 25 per cent of developing countries' import bills) increased over 80 per cent in real terms between 1978 and 1980.

While many of the better-off developing countries have been able to expand exports and borrow extensively in commercial markets, for most of the poorer countries these new pressures come at the end of a decade in which they have made little or no progress. Some countries in South Asia have weathered the 1970s reasonably well. But the majority of the poor countries of Asia and Africa suffered reduced growth in the 1970s, participated negligibly in the expansion of world trade and benefited from aid increases only for a short period after the first oil-price rise.

Now they face the 1980s, which have started badly for them, with no sign of change in either their trade or their aid prospects. There is much to be improved in their domestic performance. But without more support from the international environment, their maximum efforts can at best yield only slow progress. The world will divide even more sharply between the haves and the have nots. These countries, even excluding China, have a population of well over 1 billion people. The 1980s therefore pose the question of how developing countries in general can maintain or accelerate their growth; and how the poor countries in particular can find ways out of an increasingly desperate predicament.

Ten-year perspective

The 1980s have begun on a sluggish note. Growth in the industrial market economies as a group slowed down sharply in 1980 and will remain slow in 1981 as well. These countries show few signs of overcoming the inflationary legacy of the 1970s — just one of several similarities between the two decades. Others include rising real oil prices; continuing large trade deficits and, consequently, heavy borrowing from abroad by the developing countries; and the prospect of much slower growth in low-income countries than in middle-income countries.

Growth in the 1970s

The *industrial countries* grew at just over 5 per cent a year in the 1960s and, until the last years of the decade, experienced relatively little inflation or unemployment. Their erratic growth in the 1970s averaged only 3.3 per cent a year. Aggregate output fell in 1974-75; although it then recovered, the steady growth of the 1960s has not been resumed. Of all the different country groups, the industrial countries have fallen farthest below their earlier trend.

The progress of *developing countries* has been influenced both by the external environment and by their domestic policies. For the oil exporters, where one-fifth of the population of developing countries lives, the 1970s were a period of rapid growth. Some developing countries also obtained indirect benefits from higher oil prices — by increasing their exports to the oil producers or from remittances of migrant workers or from aid from the oil producers.

As a group, oil importers were affected in two main ways by the events of the 1970s.

Their current account deficit widened, from $ 7 billion in 1973 to $ 33 billion in 1974 and $ 39 billion in 1975 (5.2 per cent of GNP). It then fell to $ 26 billion by 1978 as the industrial countries recovered and the developing countries expanded their exports. But the 1979-80 oil-price increase and slower growth in the industrial economies boosted the developing countries' current account deficit to $ 44 billion in 1979 and $ 70 billion in 1980 (4.5 per cent of GNP). Preliminary estimates indicate that it may remain at about this level in 1981.

Projected growth, developing countries : The overall effect of all these different influences suggests that developing countries could improve on their record of the 1970s, when they grew at 5.1 per cent a year. In the 1980s the High case projects about 5.7 per cent a year, the Low case about 4.5 per cent. While countries adjust, growth is constrained. In the High case, it regains its pace of the 1960s and early 1970s. In the Low case, growth remains below historical averages throughout the decade.

Interdependence

Despite the widening of the gap in incomes per person, production in the developing countries is growing faster than that of the developed countries. (The explanation for this derives from the faster population growth rates in developing countries.) As a result, the developing world is projected to contri-

Excerpts from the World Development Report : 1981 *released by the World Bank on August* 10.

bute about 20 per cent of world GDP by 1990, compared to only 15 per cent in 1970. Furthermore, it is expected to contribute about 26 per cent of the increase in world production between 1980 and 1990 (High case). By 1990 its exports will constitute 25 per cent of total world trade and will account for 26 per cent of the increase in world trade between 1980 and 1990.

Balance-of-payments patterns

Throughout the 1980s the developing countries are expected to have current account deficits that are relatively large in real terms although they will decline as a percentage of GNP. Such deficits, of course, depend on the creditworthiness of developing countries and their access to capital markets. Between 1980 and 1985 the oil exporters are likely to move from small surplus to deficit, and then remain there. Conversely, the industrial countries are projected to turn a small deficit in 1980 into a sizable surplus by 1990. Their growing surplus is offset by a decline in the surplus of the capital-surplus oil exporters, from $ 85 billion in 1980 to between $ 16 billion and $ 35 billion (in 1978 dollars) by 1990.

World trade grew by an average of 5.7 per cent a year in the 1970s, after almost 8 per cent a year in the 1960s. Despite this slowdown of the growth of total trade, developing-country nonfuel exports grew faster — over 7 per cent a year in the 1970s, as compared with 5 per cent in the 1960s. This expansion of trade has provided developing countries an avenue for growth and industrialisation, and, for the oil importers, a source of earnings to meet their increasing fuel costs.

Trade in the 1970s

The most striking changes in the pattern of world trade during the past 10 years have resulted from the increase of fuel prices. World trade in fuels increased from $ 29 billion in 1970 to $ 535 billion in 1980, or from 7 per cent of world trade to 21 per cent.

That 14 percentage-point increase is considerably larger than the Federal Republic of Germany's or the United States' share of world trade. Even excluding the (relatively small) increase in volume, paying for the 1970s' fuel-price increases was therefore equivalent to finding the money to buy all the exports of another United States or Federal Republic of Germany.

Because their exports were expanding rapidly, many of the middle-income oil importers were able to reduce their current account deficits to levels financeable in the medium term, without sacrificing their growth. Between 1973 and 1978, the industrial countries increased their exports to the oil exporters by enough to cover some two-thirds of the extra cost of their imported oil. Only the low-income oil importers did not reap significant benefits from international trade. Many of them reduced their current account deficits by curbing imports (and hence growth) rather than by expanding exports. Increased aid helped others finance their larger deficits.

The developing countries play an increasingly important role in world trade. They will account for nearly 30 per cent of the increase in world trade between 1980 and 1990. They purchase 38 per cent of EEC exports outside the Community; of this total, half are purchased by oil-exporting countries and half by oil-importing countries. The United States sells 36 per cent of its exports to developing countries; a third of these go to the oil-exporting and two-thirds to the oil-importing countries. For

---

Workers' remittances

REMITTANCES from their nationals working abroad yielded about $ 24 billion to the developing countries in 1980. Migrant workers have been mostly concentrated in Europe and more recently in the Persian Gulf area. Major beneficiaries among developing countries of remittances from Europe have been Yugoslavia, Turkey, Portugal and Morocco, Migrant labourers employed in the Gulf states have come mainly from other Arab countries (Egypt, Jordan, Syria, the Yemen Arab Republic and the People's Democratic Republic of Yemen) and from South Asia (India, Pakistan and Bangladesh) although increasing numbers have come from East Asia.

Remittance inflows to major labour-exporting countries, 1978

Country	Amount (millions of dollars)	Remittances as a percentage of merchandise exports
Yugoslavia	2,938.0	51.8
Turkey	1,011.6	44.5

In these countries, remittance inflows are almost the only source of foreign exchange earnings

The level of remittances is closely related to the number of migrant workers abroad and their wages, as has been observed in countries such as Greece, Yugoslavia and Turkey. In the case of the countries supplying labour to the Gulf states, migrant workers seem to remit more the lower their occupational level. Even though the propensity of unskilled workers to remit usually remains high because they do not often take their families to the country of employment it tends to fall over time as the basic needs of their families are met and their own local expenses increase.

Some labour-exporting countries have had special schemes to attract remittances from their workers abroad. But recent research shows that such incentive schemes do not appear to have any significant impact on total remittances although they may lead to some reallocation of savings.

The experience of Europe has demonstrated that there is a limit to the number of foreign workers that a society will wish to allow. Many countries have put severe restrictions on foreign labour and have attempted to "stabilise" their migrant labour force. Although these measures are frequently attributed to recession and the difficulties of 1973-75, the timing of the beginning of these restrictions shows that they preceded the oil price rise. On the other hand, there has been a process of "maturing" of the migrant population. Despite original intentions to import labour only, even the countries with the strictest immigration laws found that migration had taken on a circulatory character: some workers returned, many had acquired permanency status and the age-sex composition of the migrant population was beginning to approach normal profiles.

The Middle Eastern countries are going through a similar experience. The problem is more acute in this region; in no other country is the proportion of foreigners in the labour force as large. Nevertheless, the outlook for increasing the volume of migrant labour in the Middle East in the near future may be slightly better than in Europe because the economies of the labour importers in this region are crucially dependent on migrant labour, and because Iraq and Saudi Arabia have not yet reached the same relative levels of non-national populations as Kuwait and the Gulf states. In the longer term, however, the prospects for increased employment of migrant labour do not appear bright in this region either. Therefore, unless new "poles" of immigration develop, labour exporters are likely to find that remittance flows will not grow at the same rates as in the past.

Japan the relevant figures are 46 per cent to developing countries, with 14 per cent going to oil exporters and 32 per cent going to oil importers. In manufactures trade as a whole, the industrial market economies had a surplus of $ 34.5 billion with the developing countries in 1978.

The developing countries increasingly act as an "engine of growth" for the rest of the world. While the main transmission of economic activity is still from the industrial to the developing countries, the reverse effects are not negligible. Some estimates suggest that an extra percentage point on the growth rate of developing countries would raise industrial countries' growth by about 0.1 to 0.2 per cent. Another study calculated that, by sustaining their imports in the mid-1970s while the rest of the world's slowed down, the middle-income countries had an impact on the industrial countries equivalent to a significant reflation of the economy of the Federal Republic of Germany. They prevented the recession in the industrial world from becoming even worse than it was.

Energy

World demand : Before 1973 energy consumption was growing proportionately to GDP in the industrial countries, somewhat faster in the developing countries. Even so, the latter now account for only 14 per cent of world commercial energy demand; a quarter of their total energy is still supplied by fuelwood and other non-commercial sources. After 1973 consumption in the industrial countries grew far less rapidly. While growth in these countries has recently recovered, it is projected to be slower than pre-1973 levels throughout the 1980s, and slowest of all country groups. In the developing countries, demand has also slowed down, but not as much. As a result, their share in total consumption will rise to 18 per cent by 1990.

External finance

In the 1960s and early 1970s foreign capital financed 10 to 20 per cent of total investment in developing countries. Most of these flows came from official or semi-official sources in the form of grants, concessional loans and market loans. Private finance consisted largely of suppliers' credits and direct foreign investments.

Even before 1970, this pattern was gradually changing. The contribution of private bank lending increased rapidly after 1967 while workers' remittances though conventionally classified as "current receipts") also became an important tem of external finance for several countries in Southern Europe and North Africa. Dramatic changes occurred in 973-75 when the developing countries had to borrow to cover their much enlarged current deficits.

The wider financing gap was bridged initially by extra aid from industrial countries, more lending by international financial institutions and depletion of reserves. But the various channels through which the oil exporters' surpluses were recycled became increasingly important. Oil producers increased their aid; remittances from migrant workers in the Middle East became a significant source of foreign exchange for many countries; there was a spectacular increase in commercial bank lending to the middle-income countries.

When the developing countries' trade deficits rose sharply after 1973, the international community responded with great urgency, and with particular concern to the needs of those countries identified as "most seriously affected". OECD donors increased their aid by 52 per cent in two years, from a historically low 0.29 per cent of their GNP in 1973 to 0.36 per cent in 1975. OPEC members increased their aid even more rapidly; it rose to $ 5.5 billion in 1975, 27 per cent of all Official Development Assistance (ODA).

The International Monetary Fund (IMF) arranged two oil facilities to help recycle surpluses accumulated by OPEC and some OECD economies. An interest subsidy reduced the cost of finance to low-income countries. The multilateral banks increased their commitments by 46 per cent in 1974 and 21 per cent in 1975. In addition, both bilateral and multilateral agencies expanded the share of programme lending and other fast disbursing aid. Thus, between 1973 and 1975 Official Development Assistance received by the low-income countries had increased by 60 per cent in real terms. Middle-income oil importers financed their enlarged deficits by borrowing at commercial terms.

Although the international response to the difficulties of 1973-75 was encouraging, during the second half of the 1970s ODA receipts grew slowly; in the case of the low-income oil importers, they actually declined in real terms. By 1980 ODA from the OECD countries was little higher as a proportion of their GNP than it had been in 1975, and only about half of the 0.70 per cent of GNP most of them had accepted as a target. Their

a. Contractual service payments on long term debt, plus remitted profits on direct investment divided by exports of goods and services.

b. Debt outstanding and disbursed.

collective performance is heavily influenced by the disappointing record of the largest donor. In 1980 their aid was 0.43 per cent of their GNP, excluding the United States (0.27 per cent of GNP). Sweden, Norway, Denmark and Netherlands exceeded the 0.70 per cent target.

The share of non-OECD countries in total ODA increased during the 1970s but it reached its peak (33 per cent of the total) in 1975. Most of this came from the capital-surplus oil exporters. As oil surpluses declined, OPEC's share in total ODA also fell, to 18 per cent, in 1979, but rose to 20 per cent in 1980. Capital-surplus oil exporters are now contributing 3.1 per cent of their GNP for aid. Aid from the non-market industrial economies is negligible, 0.12 per cent of their GNP.

The direct effect of rising oil revenues on the exports of the developing countries was small, but some developing countries, most of them among the poorest, benefited from the oil exporters' increased economic prosperity through the export of labour and the corresponding inflow of remittances. Total remittances to the developing countries, mainly from Europe and from the Gulf countries, rose from about $ 3.5 billion in 1970 to $ 24 billion in 1980 — $ 2 billion more than the developing countries' total ODA receipts, and equivalent to about 13 per cent of the major recipient economies' merchandise exports, and for some, much more.

Direct foreign investment, which constituted about 20 per cent of the net capital flows to developing countries in 1970, has grown less rapidly than other forms of external capital. Investment increased sharply in the early 1970s, responding to the commodity boom and to more favourable policies towards foreign investment in many middle-income countries. But the spurt was short-lived; after 1975 foreign equity investment did not even keep up with inflation. However, with the expansion of commercial bank lending, the form of foreign investment in developing countries itself changed. Intracompany loans supplemented equity participation. The financing needs of transnational companies were covered increasingly from sources other than the parent company, such as borrowing from local banks or the Eurocurrency market.

Private commercial bank lending was the component of external finance

---

India: More demanding adjustment

GNP grew in India by an average 3.4 per cent a year in 1964-73; it then accelerated to 4.3 per cent a year in 1974-79, despite the sharp rise in oil prices. This considerable achievement can be attributed to both short- and long-term factors. The most significant change was in :

Agriculture : In the past four years, India has imported hardly any foodgrains, and built its stocks up to unprecedented levels. As a result India was able to manage the consequences of a severe drought in 1979 without resorting to significant foodgrain imports. Over the 1970s as a whole, foodgrain production rose at an average of almost 3 per cent a year, compared with population growth of 2.2 per cent a year.

While the weather is still a major factor in Indian agriculture, the spread of irrigation and modern farming techniques has provided greater security. So far the biggest difference has occurred in wheat farming in the north-western states of Punjab, Haryana, Uttar Pradesh and spreading eastward into West Bengal. But fertiliser use and high-yielding varieties of seeds are starting to affect rice as well, and this has particular relevance for some of the poorest states in the east and south of the country.

By virtually ending foodgrain imports, India has saved substantial amounts of foreign exchange, helping it to pay for more expensive oil without curbing other imports. It also received the benefits of migrants' remittances.

Migrants' remittances : In the mid-1970s, the number of Indian workers in the Gulf states increased considerably. Their annual remittances rose from less than $ 250 million in 1974 to an estimated $ 2.4 billion in 1980.

The combination of increased remittances and savings on grain imports allowed India to run a current account surplus in the three years 1976-77 to 1978-79. As a result, India's foreign exchange reserves rose to a peak of over $ 7 billion in 1979. By 1977 the government was able to take advantage of this situation by relaxing some import restrictions on.

Industry : India's policy of import substitution has produced a diversified industrial base. Investment has risen substantially and has been financed by domestic savings for most of the past 20 years. Yet in industry at least, extra investment has not produced more rapid growth. Since the mid-1960s, industrial growth has slowed. This can be attributed partly to a sluggish rise in domestic demand and the fact that Indian industry has benefited little from the scale economies of exporting to world markets. In addition, industrial licensing has restricted the entry of new firms into some industries and, in others, limited the expansion of existing firms. But a more significant cause has been supply constraints at home, in particular.

Infrastructure : During the 1970s power shortages have become chronic. They are less the result of inadequate capacity than of the poor performance of existing capacity, itself due to input shortages compounded by maintenance and management failures. On government estimates, electricity shortfalls averaged 12 per cent a year between 1975 and 1980. As a direct result, GDP may have been cut by 2 per cent a year.

The power industry has also been hit by shortages of coal. In the three years 1977-78 to 1979-80, coal production stagnated although it picked up again in 1980-81. Constraints on railway operation through such factors as labour disputes and power shortages have also restricted the movement of coal that was produced. Failings in these three infrastructural cornerstones — coal, power and transport — have all been interconnected.

Official policy aims to correct all these domestic constraints. Licensing requirements have been eased, allowing companies in core sectors to expand their capacity by 5 per cent a year for five years. Export production has been exempted from licensing restrictions for all units, while units exporting all their output will be exempt from all import controls and duties, will receive favourable tax treatment and will not be subject to prevailing laws on foreign participation. As for infrastructure, the Sixth Plan (running up to 1985) provides for much increased investment in coal, power and railways.

In the short term, these changes can do little to ease the scarcity of foreign exchange that has developed in 1980 and 1981. Almost 45 per cent of India's import bill in 1980-81 was accounted for by oil. Migrant remittances are unlikely to grow as rapidly as they did in the 1970s. Nor is aid, which played an important role in cushioning the balance of payments after the 1973-74 oil-price increases. India is, therefore, facing a more demanding adjustment than before Nevertheless, if it continues its agricultural progress, adopts more outward looking trade policies, improves the infrastructural support for its industry, and continues to receive external support fo its development effort, India should be able to restore its external position without seriously slowing down its growth.

that grew most rapidly, from about $ 4 billion in 1970 to $ 36.1 billion in 1980. By the end of 1980 the outstanding debt of the developing countries to private sources of market capital had reached $ 284 billion, up from $ 32 billion in 1970. Most of this increase came in the form of syndicated bank loans with floating interest rates. The system of floating rates — expressed as a margin above the London Interbank Offered Rate (LIBOR) — enabled the banks to offer longer maturities without exposing themselves to the risks of changes in short-term rates of interest. In contrast borrowing in the bond market did not expand. Only in 1977 and 1978 did the oil importers borrow a significant amount through bond issues. Since 1977 most new bond issues by developing countries have been in the form of floating-rate notes, which are financially very similar to syndicated loans from the viewpoint of both lenders and borrowers.

Commercial bank lending to the developing countries was concentrated almost totally in the middle-income countries; the low-income oil importers did not borrow more than $ 630 million (net) from the private banks in any year. Among the middle-income countries the largest borrowers were oil exporters (Mexico, Venezuela and Algeria) and upper middle-income countries (Brazil, Spain, Argentina, Yugoslavia and South Korea). These eight countries accounted for 60 per cent of total bank debt outstanding in 1979.

Food subsidies: Three cases

The benefits and costs of food subsidy schemes depend on several factors, including the income level of beneficiaries, the stage of development of the country (particularly its agriculture) and the vulnerability of the scheme to budget constraints.

Food subsidies can contribute to a vicious circle of declining producer incentives and budgetary pressure. In Zambia, for example, officially controlled consumer prices for food have risen more slowly than other prices. From 1976 to 1980, a period of severe economic crisis, maize and fertiliser subsidies increased from 10 to 20 per cent of the recurrent budget. Even so, producer prices have been below import prices. The subsidy has primarily benefited urban consumers, who are better off than most farmers, especially those in remote areas. Weak producer-incentives in turn have reduced the amounts marketed through official channels. A black market has developed where consumers pay prices far higher than import prices. (In 1981, however, the government increased maize meal prices by over 30 per cent and reduced subsidies).

Food management in several South Asian countries features a complex of procurement, storage, rationed distribution, commercial imports, food aid, export bans and numerous pricing and movement interventions. Although these systems are generally costly, the balance between their costs and benefits varies greatly with the country, the coverage of the system, the choice of subsidised foodstuffs, eligibility criteria, purchasing conditions and selection of ration shop locations.

In India, for example, where wheat, rice and coarse grains are sold in ration or fair-price shops, public intervention seems an effective way of reaching the poor, despite the administrative difficulties. Increases in procurement prices, to reflect rising import costs, have been passed on to consumers. As a result, the subsidy has been kept within manageable limits and budgetary pressures have posed little threat to its survival.

Several middle-income countries have succeeded in directly attacking malnutrition through targeted food distribution systems. Colombia's food coupon scheme, introduced in the mid-1970s, is modest in scale, reaching about 140,000 households and costing less than 0.1 per cent of the Central Government's current spending. The coupons are disbursed to farmers in poorer regions and can be redeemed for a limited variety of protein-fortified foods.

BOOKS & IDEAS

In cause of rural development

Directory of Organisations Involved in Rural Development and Appropriate Technology

Edited by S. S. Lodha,

Published by Centre for Rural Development and Appropriate Technology. Indian Institute of Technology, Hauz Khas. New Delhi 110 016; Pages 92; Price not mentioned.

Projects on Rural Development and Appropriate Technology

Compiled and edited by T. Karunakaran

Published by Centre for Rural Development and Appropriate Technology, Indian Institute of Technology, Hauz Khas, New Delhi 110 016; Pages 56; Price not mentioned.

Indian scientists and engineers are often blamed for getting themselves engaged in "glamourous" lines like nuclear and space research ignoring the more relevant questions of a technology for rural development. It is true that Indian space and nuclear research, costing crores of rupees, command wider attention at least in the press here and abroad but quite a sizable number of scientists and engineers and the institutions in which they are working have shown an awareness of the responsibility cast on them that their primary duty is to bring an improvement in the village life. At least the Centre for Rural Development and Appropriate Technology, Indian Institute of Technology, New Delhi, has shown through these two publications that a scientific approach is being made towards bettering the living conditions of villages and that quite a variety of organisations, including scientific institutions and industrial houses, besides philanthropic bodies, are engaged in the task. That their efforts so far have not been able to make a dent in rural poverty is an acknowledged fact. Neither has planning. It makes the challenge ahead much more exciting and the two publications providing a list of organisations engaged in the rural development and the research in various branches that is in progress should facilitate the task of those who have devoted themselves to this cause. With financial resources as well as organisational and scientific resources limited it is imperative to ensure that there is no overlaping of and as a consequence wastage of efforts. The two publications could ideally serve that purpose.

It is interesting to know, as the directory brings out, that there are as many as 490 organisations involved in rural development programmes and even the smallest state or union territory has two or three of them. Additionally 49 industrial enterprises have been listed as engaged in this work, not necessarily in the area in which their headquarters are located. It may seem odd that comparatively industrially developed states such as Maharashtra, West Bengal, Tamil Nadu, Gujarat and Karnataka should have more of these institutions than poor and backward states like Orissa and Bihar. For instance, Maharashtra has as many as 73 of them, Gujarat 47, West Bengal 41, and Tamil Nadu 36 as against Madhya Pradesh's 16, Bihar's 39, and Orissa's 31. But then the organisational and financial resources can be mobilised better in the industrialised states than in the backward states. The directory not only gives a comprehensive list of the institutions working for rural development but also their line of activities. Of course some of these institutions such as Bharatiya Agro-Industries Foundation, Kora Kendra, Central Food Technological Research Institute are familiar names. But others have not been generally in the picture. It is hoped however that all of them are active and making a sincere endeavour in the cause of rural development.

The Director of IIT, Delhi, Mr O. P. Jain, emphasises in his foreward to the second publication that a major breakthrough in technology is needed if an improvement is to be brought in the quality of rural life. More productive agricultural techniques, promotion of family village industries, better houses, better roads and clean drinking water are matters which require immediate attention. And this is only possible, he says, when institutions which are engaged in the pursuit of higher science and technology take up these challenging tasks. The editor, Mr T. Karunakaran, explains that the present report represents an attempt to evolve a framework to appreciate a newly emerging inter-disciplinary area called rural development and appropriate technology. As such not only the on-going projects are listed but additional projects, some of which might be taken up by the centre in future, are also mentioned. In fact, he says some of the fields and topics might have also been undertaken for investigation by other institutions working in the field of rural development.

In 11 chapters titled Basic Needs, Health Care, Calamity Mitigation, Agricultural Activity and Animal Husbandry, Agro-products Processing Technology, Agro-wastes, Industrial and Other Gainful Activities, Resources and Energy, Transportation and Communication, Management and Systems Aspects, Human Skill Development and Quality of Life, not only details of projects in progress are given but also future lines of investigations are suggested. Thus, the second publication serves as a useful and good supplement to the directory of organisations involved in rural development.

D. B. Mahatme

Puzzle of distribution of national income

The Share of Wages in National Income

By Ashok Mitra,

Oxford University Press, Calcutta; 1980; *Price Rs* 75.

The author of the book is at present the Finance Minister in the CPI-(M) Government in West Bengal. He is marxist by persuasion but he has brought an objective outlook on this very important subject of the economic theory. This is clear from his criticism of Marx's theory of increasing misery of the proletariat as too categorical. "He was certain that the relative share of labour will continue to decline in capitalist societies over time. Facts have proved otherwise; . . ." He adds: "In spite of all our admiration for Marx's meticulous macrodynamics, we must travel further for a more perfect theory of the distribution of national income."

As the author explains in the preface the present publication is a reprint of the book published in 1954. Only a limited number of copies were then published and the book ceased to be available after a few years. It was therefore considered desirable to reprint it 'as it deals with one of the major conundrums in macro-economic theory—the relative shares of factors — on which little literature exists'. The main purpose of the book is to examine critically Kalecki's theory of income distribution which the author describes as a tautology. It is based largely on the concept of the degree of monopoly which according to the author is only an intermediate concept and does not concern itself with the basic variables that regulate the processes in an economy."

"To illustrate his point and to indicate the direction in which an alternate theory could be developed the author examines the twin mechanism in Kalecki's model of income distribution, namely, the degree of monopoly and the price of basic raw materials. This could suggest that an increase in the degree of monopoly should reduce the relative share of manual labour and *vice versa*. But the four variables involved in Kalecki's analysis, namely, aggregate wage bill, aggregate raw material cost, aggregate home produced national income and the degree of monopoly in the economy as a whole cannot be accommodated in any single formula without getting involved in tautology and so Kalecki's explanation is vitiated by the fault of begging the question. As the author puts it, "Instead of showing that the relative shares have remained unchanged (in Britain between 1880 and 1913) because of the stability of degree of monopoly, he refers to the stability in the degree of monopoly from the fact of currency in relative shares."

The author examines the statistical techniques employed by Kalecki in his analysis and seeks to establish that their imperfections are due to 'his failure to develop a quantifiable measure of the degree of monopoly'. To correct this plan the author has suggested an alternative approach. He uses the tools developed by him to arrive at different statistical results. He, however, warns the reader that his emphasis could be more in economic logic than on statistical findings. Citing what he calls indirect evidence of the presence of market imperfections the author concludes that attempts to build afresh a perfect market model would not lead us very far. He, therefore, suggests an approach that should not take us away from Kalecki but rather beyond his analysis.

He starts with a single model with the main variables like labour and import quotas, the rate of depreciation, the wage price rate, the number of competitors in the market at 'the zero demand price'. He tests his model by combining data of income distribution in the UK 1870-1938 and seeks to produce an explanation for the long-term stability in national income distribution in the British economy. In the process he has tried to argue that the role of raw materials prices, determining variable in Kalecki's model, is reverse of what Kalecki had mplied. A rise in price raw materials in he author's model will increase and not ower the wage share as argued by Kalecki. As for the other determining variable, namely, the money wage rate could be ignored because of demand regularity.

The author admits that there could be other variables. He says : "Once the socio-historical process is explicitly taken into account, we have to admit that income distribution between classes merely mirrors the different economic, political and organisational capabilities of the classes who share out the national income". But the author concludes by agreeing with Joan Robinson that "If there is any law governing the distribution of income between classes it still remains to be discovered."

Thus in spite of the best efforts of the scholars to perfect the tools of analysis and economic logic the puzzle of distribution of national income remains unsolved posing further challenge to the academicians.

Rohit Dave

Dangerous trend towards big government

GOVERNMENT activity has been expanding by leaps and bounds in all the western industrialised countries. It shows up in a number of different indicators. For one the percentage of GNP accounted for by government consumption of goods and services in four leading western countries rose from about four per cent to about 16 per cent in the 100 years between 1860 and 1960. This trend has continued unchecked in all the western democracies.

In an article titled "The dangerous trend towards big government", in *Prospects*, published by the Swiss Bank Corporation, Prof Peter Bernholz of Basle University, discusses how to reverse this trend. He writes: "In present-day democracies, legislatures have the right to deal with any matters they wish (barring a few exceptions stipulated in the constitution) and to decide these issues by a simple majority. This arrangement has paved the way for increasingly far-reaching official intervention and the uncontrolled growth of government. It would be possible to halt this trend or turn back the clock somewhat by setting up constitutional limits on government activity. In that case, however, it would be necessary to require, say 2/3 or 3/4 majority of the legislature or the voters to amend the constitution, rather than just a simple majority.

"The first constitutional limitation to consider would be a prohibition on all direct government interference, such as erection of import barriers, setting of price floors or ceilings, granting of price subsidies, etc except under certain precisely defined conditions. An example of such conditions might be instances of dumping by foreign cartels or state trading monopolies. In no case, though, should profit levels or the employment situation in a given business sector justify an exception.

"Second, the constitution should forbid the state production or delivery of goods that are basically of a private nature. Third, the present system of compulsory old-age and medical insurance could be made unconstitutional and replaced by a negative income tax.

"Constitutional restrictions on the decision-making latitude of democratically elected officials can eliminate only some of the reasons behind expanding governmental activity. Competition between political parties can lead to inefficiency in the delivery of public and utility services or their oversupply, for several reasons : rising tax revenues just "happen" in a growing economy; those who benefit from certain public services are not required to bear the costs in the form of higher taxes or fees; and the bureaucracy tends to promote expansion of government activity and inefficiency through its information policy and its collaboration with special-interest groups.

"Obviously it is not yet possible to work out adequate and useful proposals for the elimination of all causes of inefficiency and potential oversupply of services by the government apparatus. Nor must the proposals made at this point necessarily be the best possible ones. Moreover, when it comes to implementing these proposals, the problem still remains of how the proposed constitutional changes could be achieved at all under prevailing political conditions.

"As for the problem of bureaucracy, the first thing to realise is that restricting the level of government activity would automatically limit the size of the bureaucracy and the leverage brought to bear by special-interest groups."

CORPORATE SECTOR

In the market

J. K. Synthetics

J. K. Synthetics Ltd (Regd Office : Kamla Tower, Kanpur 208 001, UP) entered the capital market on August 10 with a public issue of 5 lakhs secured redeemable debentures (second series) of Rs 100 each carrying interest at 13.5 per cent per annum and of a total value of Rs 5 crores. Explaining the objectives behind the issue, Mr Sohanlal Singhania, a director of the company, told newsmen in Bombay that the issue would provide long-term working capital needs of the company. The company was in the process of strengthening its capital base in view of the various schemes being undertaken by it. These included expansion of polyester filament yarn capacity by 6,000 tonnes annually, expansion of polyester staple fibre capacity by 6,000 tonnes annually, increase in nylon tyre cord fabric capacity by 1,960 tonnes and of tyre cord yarn by 1,400 tonnes, and two new projects for cement—one for white cement with a capacity of 50,000 tonnes annually and the other for portland cement at Nimbahera with an annual capacity of 420,000 tonnes.

Mr Singhania said that the company had a steady record of good performance over the past few years and the net worth of its equity share was Rs 38.39 in 1980 as against Rs 27.92 in 1977. The turnover in 1980 was about Rs 170 crores and was expected to rise to Rs 200 crores this year. His optimism stemmed from the fact that power position in Rajasthan had improved considerably and the plant was working at full capacity. The company had maintained consistency in dividend at 18 per cent over the years 1978-80. The debentures were fully secured, easily liquidable and moreover the company would offer to buy back these, at holder's option, at par provided the debentures have been held for three years and individual holdings did not exceed Rs 25,000. In view of these benefits, Mr Singhania felt that investors in debentures being offered now would stand to gain immensely in the future.

Vidula Chemicals

Vidula Chemicals & Manufacturing Industries Ltd (Registered Office : 7-E, Neelamber Building, 28-B, Shakespeare Sarani, Calcutta-700 017) is offering for public subscription at par 2.70 lakh equity shares of Rs 10 each totalling Rs 27 lakhs. The subscription list will open on August 19 and close on August 29 or earlier but not before August 21.

The company is setting up a plant at Gopalpur-Chandigarh in 24 Parganas district in West Bengal for the manufacture of 16,500 tonnes per annum of sulphuric acid.

Madras Elastomers

Madras Elastomers Ltd (Registered Office : 101, St. Mary's Road, Madras-600 018) is offering for public subscription at par 265,800 equity shares of Rs 10 each totalling Rs 26.58 lakhs. The subscription list will open on August 17 and close on August 29 or earlier but not before August 19.

The company is setting up a project at Maraimalainagar in Chingleput district, Tamil Nadu, for manufacturing 7,200 tonnes per annum of carbon black master batches and metal bonded elastomers.

Kamdhenu Engineering Industries

Kamdhenu Engineering Industries Ltd (Registered Office : 5, Ramkumar Rakshit Lane, Calcutta-700 007) is offering for public subscription at par 1.45 lakh equity shares of Rs 10 each totalling Rs 14.50 lakhs. The subscription list will open on August 17 and close on August 22 or earlier but not before August 20.

Other developments

Bowreah Cotton : Sales rise

Sales of Bowreah Cotton Mills Company Ltd for the year ended December 1980 increased to Rs 22.31 crores from Rs 16.08 crores in the previous year. The net profit, after providing Rs 97.81 lakhs (Rs 72.27 lakhs) for interest payments, and Rs 54.84 lakhs (Rs 45.43 lakhs) for depreciation, amounted to Rs 61.21 lakhs (Rs 67.73 lakhs). The equity dividend recommended for the year under review is 15 per cent (17.5 per cent) payable on the higher capital resulting from issue of 1 : 2 bonus shares made in January 1981. An amount of Rs 25. lakhs (Rs 36.79 lakhs) is transferred to investment allowance reserve and Rs 18 lakhs (Rs 21 lakhs), to general reserve. Production of cloth during the year under review was 18.29 million metres (13.93 million metres) and that of yarn was 3,332 tonnes (2,241 tonnes). Production of waste was 727 tonnes (512 tonnes). Capital expenditure incurred during the year under review was Rs 1.41 crores.

Kanoria Chemicals : Bonus shares proposed

Kanoria Chemicals & Industries Ltd has reported higher sales for the year ended March 1981 at Rs 36.70 crores compared to Rs 32 crores in the previous year. The net profit, after providing Rs 1.12 crores (Rs 1.22 crores) for interest payments, Rs 88.18 lakhs (Rs 73.08 lakhs) for depreciation and Rs 81 lakhs (Rs 1.05 crores) for taxation, amounted to Rs 1.89 crores (Rs 1.23 crores). The equity dividend recommended for the year under review is 12 per cent (same). An amount of Rs 42.50 lakhs (Rs 27.40 lakhs) is transferred to investment allowance reserve and Rs 1.45 crores (Rs 91 lakhs) to general reserve. The company proposes to issue 1 : 2 bonus shares subject to necessary approvals.

Production of caustic soda during the year under review was 21,070 tonnes (20,057 tonnes) and that of benzene hexachloride was 14,771 tonnes (12,329 tonnes). Production of stable bleaching powder was 5,018 tonnes (6,045 tonnes) and that of salt was 16,370 tonnes (7,118 tonnes). Production of jute goods was 19,497 tonnes (20,689 tonnes). Exports during the year under review were Rs 10.70 crores (Rs 14.58 crores).

Indian Aluminium expertise for Malaysia

An agreement has been concluded between Indian Aluminium Company Ltd and Aluminium Company of Malaysia, Berhad, under which Indian Aluminium will be responsible for technical and engineering know-how and also for supervising and monitoring the construction of a new aluminium sheet and foil rolling complex for Aluminium Company of Malaysia at Kelang in Selangor, Malaysia. The project, which will cost US $ 50 million, will have an ultimate sheet and foil capacity of 24,000 tonnes and 6,000 tonnes per annum respectively. This is the first instance of an Indian aluminium company securing a contract for providing technical and engineering services to an off-shore aluminium company.

Alitalia's FAST cargo reservation

FAST is a system created and developed by Alitalia for the automation of all airline functions relating to freight transportation — from flight space availability control to shipment reservation, from warehouse and documents control to customer assistance. Under a contract signed with Alitalia recently Sita will offer this automated shared cargo service to its airline members throughout the world. The version used by Sita will also include the 'on-line schedule change' developed by Swissair. Sita will provide this service utilising its IBM data processing centre at Paris, interconnecting the airlines joining the system through its worldwide data transsmission network which operates in 156 countries for 241 airlines.

FAST brings many essential benefits to customers. It allows a better use of space availability, a reduction in transit time and a consequent faster delivery of the goods. But most important, it makes available all information on the shipment simultaneously at all connected terminals enabling the shipper and consignee to keep track of the shipment at any stage.

Gold for promise toothpaste

Promise toothpaste, made by Balsara Hygiene Products, has recently won the gold medal in the toothpaste category at the 17th Monde Selections of Beauty and Toilet Products, held in Amsterdam. Competing with leading international brands, it won on the basis of detailed laboratory tests. Promise toothpaste, with its unique clove oil formula has, in a very short span of time, made its mark in India. International demand is fast increasing too and it is already being exported to 15 countries. Negotiations are going on for complete toothpaste plants to be set up by Balsaras in Kuwait, Ethiopia, Sri Lanka and other foreign countries.

Nirlon Synthetic: Bonus shares proposed

Nirlon Synthetic Fibres & Chemicals Ltd has reported higher sales for the year ended March 1981 at Rs 96.67 crores compared to Rs 71.24 crores in the previous year. The net profit after providing Rs 3.77 crores (Rs 3.40 crores) for depreciation and making no provision for taxation (Rs 22 lakhs), amounted to Rs 4.80 crores (Rs 3.51 crores). The equity dividend recommended for the year under review is 22.5 per cent (same). An amount of Rs 1.10 crores (Rs 75 lakhs) is transferred to investment allowance reserve. The company proposes to issue 1:2 bonus shares subject to necessary approvals.

Ductron Castings: Benefits of expansion

Ductron Castings Ltd, which operates a most modern foundry at Hyderabad, expects its sales to increase to Rs 2.09 crores in the year ended March 1981 from Rs 87 lakhs in the preceding year and earn a gross profit of Rs 42.36 lakhs for the year as against only Rs 0.44 lakh in 1979-80. The company expects to maintain equity dividend at 12 per cent. The optimism stems from the fact that the company has completed a modernisation and expansion programme that has taken up its production capacity from 1,000 tonnes to 3,000 tonnes per annum. What is more this programme has cost relatively little. The outlay on the original scheme involving a capacity of 900 tonnes was Rs 36 lakhs. The capacity was raised by 100 tonnes at a cost of Rs 6 lakhs and the recent expansion by 2,000 tonnes has cost about Rs 88 lakhs of which internal accruals accounted for Rs 23.54 lakhs and term loans Rs 64 lakhs. Mr B. G. Sastry, a technocrat who is the brain behind this project, has earned so much goodwill with the financial institutions like Industrial Development Bank of India, Andhra Pradesh State Financial Corporation and Andhra Pradesh Industrial Development Corporation that they came forward readily to liberally assist the expansion and modernisation programme. The company has also set up a full-fledged research and development laboratory and is making constant efforts to develop new products to meet specialised requirements of industries like automobiles, tractors, diesel engines, etc and of railways.

Alkali and Chemical Corporation suffer loss

The Alkali and Chemical Corporation has suffered a heavy loss of Rs 3.56 crores during the first six months of the year ending September 1981, although the sales volume at Rs 29.9 crores is more or less close to Rs 30.88 crores during the corresponding half year of the previous working year and does not compare badly with Rs 72.76 crores for the full working year ended last September. The company had a trading profit of Rs 1.53 crores during its last working year and only Rs 6 lakhs during the first six months of 1980-81.

Poor availability of industrial alchohol and doubling of the delivered cost resulting from the increase of as much as 400 per cent in pass fee levied by the UP Government has resulted in the company's loss. The polyethylene plant has remained shut down since the end of last June which is bound to increase the working losses over the current working year.

Forthcoming company meetings

AUGUST 15 TO AUGUST 21

The Indian Card Clothing Co Ltd, Bombay-Pune Road, Pimpri, Pune-411 018. (*August* 20, 12 *p.m.*)

Indo-Asahi Glass Co Ltd, Bengal National Chamber of Commerce & Industry, 23, R. N. Mukerjee Road, Calcutta-700 001. (*August* 21, 11 *a.m.*)

Pivotals recover

Bombay, August 10

After an initial perceptible markdown, pivotals staged a recovery in later dealings. With buying and selling almost evenly matching at the final stage, however, the general trend was a mixed pattern at the end of the week. Activity was moderate and the undertone at the close appeared steady.

There was heavy nervous bull iquidation initially on expectations of drastic changes in the Union cabinet. Equities, however, soon started rallying on further reports that there might not be any changes in major portfolios like home, inance, etc, for the time being in view of the impending monsoon Parliament session beginning on August 17. With no follow-up support at the improved levels, most of the scrips could not re-ain their best rates.

After the previous week's severe etback on reports that the world hipping industry has again star-ed sliding back, shipping shares taged a partial recovery. Apart rom short-covering, the rally vas accelerated by the Govern-nent's decision not to raise the nterest rate on loans to shipping ompanies which seek to acquire ew ships.

Great Eastern Shipping rallied martly from the week's low of s 47.50 to Rs 59. With scatter-d profit-taking at this stage, the crip could close at Rs 56.75, ith a net gain of Rs 3. Scindia lso participated in the recovery nd the scrip gained Rs 2 at s 29.

Century staged a dramatic re-overy from the low of Rs 762 to s 817 before winding up the ession at Rs 813.50 with a new mall gain of Rs 4.50. Standard, owever, encountered violent uctuations on alternate bouts of lling and buying. The scrip oved from Rs 580 to Rs 525, as e buying at the low level help- the scrip to finish at Rs 552. mbay Dyeing, ACC, Tata Steel, LCO, Voltas, Morarjee, Swan, L and Tata Oil lost significant ound on persistent offerings.

In the cash section, Press Metal rdened further by 4 points to 44 on release of a good set of ures and higher dividend of 15 r cent for the year ended rch 1981 against 13 per cent in 9-80.

Market Gossip

Madras Petro-Chem — management take over?

THE Industrial Development Bank of India (IDBI) is reported to have sounded the Kothari group of Madras for a take-over of the management of Madras Petro-Chem Ltd, a sick unit in Maharashtra, whose production facilities are located at Manali, Madras. The IDBI and other financial institutions and public sector banks have a considerable stake in the company because of the loans granted to this sick unit as well as the equity acquired through the conversion of loans. Kotharis are reportedly examining the proposal and are seeking clarifications. The company's financial position, its product-mix, the market for its products and other relevant aspects will be examined by the Kotharis before agreeing to manage this sick unit in Tamil Nadu

The company was originally incorporated as Nagpal Petro-Chem Refinery Private Ltd in 1967 in Maharashtra and was converted into a public limited company in 1969. In 1970 the name was changed to Nagpal Ambadi Petro-Chem Refining Ltd and again to Nagpal Petro-Chem Ltd in 1975. It was finally changed to the present name in 1980. The company has a technical collaboration agreement with Witco Chemical Corporation of USA. The summarised balance sheet of Madras Petro-Chem as at the end of August 1979 (See table) revealed a picture of bankruptcy in that loans and interest thereon aggregating Rs 10.87 crores far exceeded the fixed assets amounting to Rs 3.48 crores. Of these loans, Rs 3.85 crores were due to Industrial Credit and Investment Corporation of India Ltd (ICICI), Life Insurance Corporation of India (LIC), Tamil Nadu Industrial and Investment Corporation Ltd (TIIC) and IDBI and Rs 6.95 crores to Bank of India, Indian Bank and Central Bank of India. The balance of Rs 7 lakhs consisted of interest on short-term loans remaining unpaid. Between April 1979 and March 1980, loans amounting to Rs 40 lakhs had been converted into equity by exercising the convertibility clause by the financial institutions (IDBI — Rs 12 lakhs, LIC — Rs 17 lakhs and ICICI — Rs 11 lakhs).

Madras Petro-Chem Ltd—Balance sheet as on August 31, 1979

(Rs crores)

	Liabilities	
1.	Share capital	2.62
2.	Reserves and surplus	0.78
3.	Loans	10.87
4.	Current liabilities and provisions	0.71
	Total (1 to 4 or 5 to 8) ..	14.98
5.	Fixed assets	3.48
6.	Current assets, loans and advances	6.24*
7.	Miscellaneous expenditure	0.17
8.	Debit balance as shown in profit and loss account	5.09

* Includes a sum of Rs 3.21 crores due from the former distributors of the company.

At present it appears that what is contemplated is not a merger of the company with any Kothari group company but only a change in its management. A merger would enable a healthy corporate unit to get tax concessions in respect of over Rs 5 crores carried forward as accumulated losses by Madras Petro-Chem. It is to be seen whether Kotharis would be interested in pursuing such a prospect. As the Kotharis have established themselves in various industries such as tea, coffee, textiles, fertilisers, chemicals, electronics and textile machinery, they should not be averse to stepping into the petro-chemicals field through a management takeover of Madras Petro-Chem. Moreover, Kothari (Madras) Ltd, a Kothari group company, had announced in March 1981 plans to diversify into petro-chemicals field with projects costing about Rs 40 crores. The caustic soda unit of Kothari (Madras) is also located at Manali, Madras.

More sugar, higher price

SUGAR production has shown a rising trend in the current sugar season (October to September) with output amounting to 50.56 lakh tonnes till July 15 as against 38.13 lakh tonnes in the corresponding period of 1979-80. Against this total offtake from sugar factories till July 15 was about 36.85 lakh tonnes for internal consumption and 0.60 lakh tonnes for exports (making total offtake of 37.45 lakh tonnes) as against 42.54 lakh tonnes and 2.30 lakh tonnes (total 44.84 lakh tonnes) in the same period of the 1979-80 sugar season.

The rising output should have reflected in easier availability of the commodity in the market at reasonable prices. However, the price which had come down to as low as Rs 5.70 per kg in retail has gone up to Rs 6.70 per kg in a matter of three weeks and indications are that they will continue to go up as festive season in the State has begun. The rise is attributed to upcountry demand and sugar is being sent outside Maharashtra at the cost of local consumers. Moreover, there are uncertainties about the exact date when supplies of imported sugar should start landing — official estimates of dates of arrivals being given as August 10 and 15 and September 20. The Government expects to receive one lakh tonnes in August and a similar tonnage next month. With such a huge quantity being in the pipeline, consuming circles are surprised that the Government has announced a lower free sale quota of 1.7 lakh tonnes for August. They believe that traders are making full use of the lower release and reduced offtake from factories to jack up the price. Even co-operative sugar factories, they fear, will quote higher prices for future deliveries since they would compensate themselves for big donations made to a well publicised foundation scheme of the Maharashtra Government.

COMMODITIES

Subdued trading in cotton

Bombay, August 3

Subdued trading conditions prevailed in the spot cotton market during the past week with limited business passing. The sentiment was influenced by continued satisfactory progress of the monsoon and expectations of Pakistan Cotton imports to the extent of one lakh bales.

Although the Pakistani delegation led by Mr A. A. Qazi, General Manager of the Cotton Export Corporation of Pakistan, did reach Bombay and had prolonged discussions with the representatives of the Cotton Corporation of India and the Indian Cotton Mills' Federation, nothing materialised until the end of the week under review.

The major points that had to be thrashed out included the price difference between the rate at which Pakistan was willing to sell her cotton and the rate at which Indian buyers were willing to buy, whether any provision should be made for the fluctuating exchange rates especially in the light of steady improvement of the dollar, and the freight that had to be incurred by the buyers if bulk of the cotton could not be off-loaded in Bombay on account of the port congestion.

The following has been the trend some of the leading cotton varieties :

(Rs. per candy)

	July 31	July 24
Digvijay	5,050-5,100	5,050-5,100
Kalyan	4,750-4,850	4,800-4,900
Saurashtra CO2	4,850-5,100	4,900-5,100
Shankar 4	5,900-6,200	5,900-6,200
Maharashtra H 4	5,400-5,550	5,400-5,550
Maharashtra Varalaxmi	5,325-5,425	5,325-5,425
MP H4	5,300-5,400	5,300-5,450
MP Y1	4,900-5,000	4,950-5,000
MP 1007	5,150-5,250	5,200-5,300
MP A 51/9	5,100-5,200	5,100-5,200
MCU 5 Guntur	5,900-6,100	5,900-6,100

While the talks were going on about the possible import of Pakistan cotton, the Cotton Corporation of India went ahead with its scheme of promoting cotton exports. It may be recalled here that the entire question of cotton imports had become an issue only as a result of the CCI blindly encouraging exports without taking into account the actual statistical position of cotton and ensuring that there would be a confidence-generating carry-over stock during the lean months before the arrival of new crop Indian cotton.

Ironically enough, even before the Pakistan cotton deal for import of one lakh bales could be clinched, the Government of India announced its decision to allow initially exports of 55,000 bales of long and extra-long staple cotton. The argument conveniently put forward was that the foreign exchange that might be earned by export of this cotton could come in handy when the imported Pakistan cotton has to be paid for.

HINDUSTAN FERODO LIMITED

NOTICE

It is hereby notified for the information of the public that Hindustan Ferodo Limited propoess to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval for the establishment of a new undertaking for the production, supply, distribution or control of the undernoted new articles :

Article		**Installed Capacity/Estimated annual production**
Reprographic Toners	:	2.000 Tonnes
Etchants	:	200 Kilo litres

Other particulars of the proposed new undertaking are as under :

(i) Name of the proposed undertaking	:	HINDUSTAN FERODO LIMITED (Same as existing)
(ii) Name(s) of person(s) or authority/authorities proposing to establish the new undertaking. Where it is a body corporate, furnish details of its management structure together with those of the proposed undertaking.	:	L. B. Shastri Marg, Ghatkopar, Bombay 400 086. It is managed by the Managing Director, subject to the superintendence, control and direction of the Board of Directors. The new undertaking will be owned and operated by Hindustan Ferodo Limited and will be managed by the Board of Directors of that Company.

(iii) Capital structure of the applicant person or authority and of the proposed undertaking :

			Rs.
Authorised	:	40,00,000 Equity Shares of Rs. 10 each	4,00,00,000
Subscribed and paid up	:	24,81,703 Equity Shares of Rs. 10 each	2,48,17,030
Forfeited shares	:	2.470 Shares at Rs. 5 each being the amount originally paid up	12,350
		Total ..	2,48,29,380

(iv) Proposed location of the new undertaking	:	The undertaking is proposed to be located in an under developed area in the State of Maharashtra. The location will be finalised in consultation with the Government of Maharashtra.
(v) Brief outline of the cost of Project, the scheme and source of finance	:	The estimated investment in Fixed Assets of Rs. 63 56 lakhs is proposed to be financed by a share issue to the Indian Residents only, loans from financial and State Investment Corporation, Central Investment subsidy and Company's internal accruals.

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

For HINDUSTAN FERODO LIMITED

DEPARTMENT OF ATOMIC ENERGY
Directorate of Purchase and Stores

On behalf of the President of India, the Director, Directorate of Purchase and Stores, Department of Atomic Energy, Bombay-400 001 invites tenders as detailed below :—

1. DPS : TAPS : FAB : 41 due on 21.8.81
Fabrication and supply of Cation Tank T-17 for Regeneration Facility as per purchaser's tender document. Qty. 1 No.

2. DPS : BARC : CAP : 4047 due on 4.9.81
Universal Ultra Precision Rotary Table, face plate dia. 300 mm, through hole dia. 50 mm as per purchaser's specification. 1 No.

3. DPS : RAPS : O & M : MIA : 123 due on 4.9.81
Pressure gauge in various sizes of dial from 37 mm to 800 mm in various ranges for air, water, oil etc. Qty. 371 Nos.

4. DPS : NAPP : PPF : 56 due on 4.9.81
Supply of welded carbon steel pipes as per purchaser's tender specification. Qty. 100 mtrs.

5. DPS : BARC : EEQ : 5069 due on 4.9.81
Portable manual arc welding silicon diode rectifier welding set suitable for Argon Arc S.S. and aluminium metal welding complete with accessories as per purchaser's specifications for Bhabha Atomic Research Centre.

6. DPS : NAPP : PPED : PPF : 330 due on 5.9.81
Supply of stainless steel strainers as per purchaser's tender specifications. Qty. 201 Nos.

7. DPS : BARC : PDS : FAB : 5 due on 7.9.81
Precision machining, fabrication and assembly of components of HSM-3 as per purchaser's tender document. Qty. 12 sets.

8. DPS : NFC : FUR : 100 due on 7.9.81
Laboratory work tables in different sizes as per our drawings and tender specifications. 21 Nos.

9. DPS : NAPP : PPF : 55 due on 7.9.81
Supply of ERW carbon steel pipes in different sizes as per purchaser's tender specification. Qty. 2520 mtrs.

10. DPS : NAPP : EB : MIA : 46 due on 8.9.81
Supply of solid state cyclic timer relay for D 20 vapour recovery dryer control each having 3 relays of different specifications. Qty. 12 Nos.

11. DPS : RRC : IEE : 976 due on 8.9.81
A radiographic enhancement system to carry out certain functions on radiographic images of welds and thin objects including image scanner film recorder, display etc. as per purchaser's specification. 1 No.

12. DPS : RRC : IEE : 975 due on 8.9.81
(1) Residual gas analyser suitable for identifying and measuring partial pressures of components in residual gas as well as for leak detection operating in quadropole mass spectrometer principle. 1 complete system.
(2) Residual gas analysis system with gauge head and control unit having resolution of better than 50% valley over the whole mass range as per purchaser's specifications. 1 No.

13. DPS : BARC : MIA : 15272 due on 9.9.81
High efficiency particulate air absolute filter, casing capacity of 1700 M^3/hr in mild steel medium micro glass fibre collection efficiency 99.99%.

14. DPS : BARC : IEE : 3649 due on 9.9.81
X-Y recorder as per purchaser's specifications. 1 No.

15. DPS : BARC : IEE : 3650 due on 9.9.81
Polarographic analyser system with differential pulse cyclic voltametric, anodic/cathodic stripping modes as per purchaser's specification. 1 No.

Tender documents priced Rs. 10 each for items 5, 8, 10 and 14; Rs. 15 for item 3; Rs. 25 each for items 1, 4, 6, 7, 9, 11, 12 and 15; Rs. 35 each for items 2 and 13 and General conditions of contracts priced 50 P. to all items except items 1 and 7 can be had from the *Finance and Accounts Officer, Department of Atomic Energy, Directorate of Purchase and Stores, 3rd Floor, Mohatta Building, Palton Road, Bombay-400 001*, between 10 a.m. to 1 p.m. on all working days except on Saturdays. Import Licence will be provided only if the items are not available indigenously to all items except items 1, 3, 5, 7, 8, 10 and 13. Tenders will be received upto 3 p.m. on the due date shown above and will be opened at 4 p.m. on the same day. The right is reserved to accept or reject lowest or any tenders in part or full without assigning any reasons.

Rising trend in yarn

Bombay, August 3

A rising trend was noticed in the local yarn market during past week. The prices of 150D NRC, 120D NRC, 150D CR, 120D CR, and 150 D acetate increased by 42 paise to Rs 52.31, 84 paise to Rs 55.07, Rs 2.20 to Rs 52.86, 28 paise to Rs 54.80 and Rs 1.65 to Rs 44.05 respectively. However, the price of 100D SIV remained unchanged at Rs 55.07.

Groundnut oil hits new peak

Bombay, August 3

Groundnut oil prices touched a new peak at Rs 159 per 10 kg on August 1. The marked thrust upwards was attributed to the recent hike in imported oils duty, imposition of margins on millers, wholesalers and retailers by the Gujarat Government and inadequate release by the State Trading Corporation. In the earlier week the closing price was Rs 152.36. This indicated an increase of Rs 6.64 per 10 kg in just a week.

In view of the firmness in groundnut oil, imported oils also spurted. Besides, the supply position of imported oils was also nominal. Palmoleine hardened by Rs 5.54 to Rs 147.50, soyabean by Rs 5.60 to Rs 146.50 and RBD by Rs 9.36 to Rs 122.12 per 10 kg.
